WARNING NOTICE: The clinical procedures, medicines, dosages, and other matters described in this publication are based upon research of current literature and consultation with knowledgeable persons in the field. The procedures and matters described in this text reflect currently accepted clinical practice. However, this information cannot and should not be relied upon as necessarily applicable to a given individual's case. Accordingly, each person must be separately diagnosed to discern the patient's unique circumstances. Likewise, the manufacturer's package insert for current drug product information should be consulted before administering any drug. Publisher disclaims all liability for any inaccuracies, omissions, misuse, or misunderstanding of the information contained in this publication. Publisher cautions that this publication is not intended as a substitute for the professional judgment of trained medical personnel.

The Internet addresses listed in the text were accurate at the time of publication. The inclusion of a website does not indicate an endorsement by the authors or McGraw-Hill Education, and McGraw-Hill Education does not guarantee the accuracy of the information presented at these sites.

About the Authors

Kathryn A. Booth, RN-BSN, RMA (AMT), RPT, CPhT, MS is a registered nurse (RN) with a master's degree in education as well as certifications in phlebotomy, pharmacy tech, and medical assisting. She is an author, an educator, and a consultant for Total Care Programming, Inc. She has over 30 years of teaching, nursing, and healthcare experience that spans five states. As an educator, Kathy has been awarded the teacher of the year in three states where she taught various health sciences, including medical assisting in both a classroom and an online capacity. Kathy serves on the AMT Examinations, Qualifications, and Standards committee, as well as the advisory board for two educational institutions. She stays current through working at various practice settings as well as obtaining and maintaining certifications. Her larger goal is to develop up-to-date, dynamic healthcare educational materials to assist her and other educators and to promote healthcare professions. In addition, Kathy enjoys presenting innovative new learning solutions for the changing healthcare and educational landscape to her fellow professionals nationwide.

Leesa G. Whicker, BA, CMA (AAMA) is a Certified Medical Assistant with a BA in art with a concentration in art history. She is an educator with more than 20 years of experience in the classroom. With 35 years of experience in the healthcare field as a medical assistant, a research specialist in molecular pathogenesis and infectious disease, and a medical assisting program director and instructor, she brings a broad background of knowledge and experience to the classroom. As a curriculum expert, she has served on several committees, including the Writing Team for the Common Course Library for the North Carolina Community College System and the Curriculum Committee at Central Piedmont Community College. She remains an active member of the Curriculum Committee. Leesa was among the first instructors to develop online courses and remains active in online curriculum development. She has presented Methods of Active and Collaborative learning on the national level. Her passion is finding novel and varied ways to reach the ever-changing learning styles of today's students. She currently teaches at Central Piedmont Community College in Charlotte, North Carolina.

Terri D. Wyman, AS, CPC, CMRS has 35 years of experience in the healthcare field, first as a CMA specializing in hematology/oncology and homecare and then in the medical billing and coding field. At the suggestion of a coworker, she began her career in education as instructor and program director for both medical assisting and medical billing and coding programs for several technical schools in New England. Currently, Terri is the financial applications analyst at Baystate Wing Hospital, where her love of teaching continues in the hospital setting. She is active with her local AAPC chapter and is on the National Advisory Board for the American Medical Billing Association (AMBA). She provides continuing education opportunities for AMBA members by writing numerous billing and coding programs and speaking at their national conferences on medical coding topics, including ICD-10. In the rapidly changing world of healthcare billing and coding, she is excited to continue sharing the language of billing and coding with instructors, students, and career professionals. Terri sends special thanks to Dale for his unending support and to Francis Stein, MD, whose patience with a new medical assistant years ago showed her the joy of learning and education.

UNIT ONE

Medical Assisting as a Career

CHAPTER 1

Introduction to Medical Assisting 1

- 1.1 Responsibilities of the Medical Assistant 2
- 1.2 Medical Assisting Organizations 4
- 1.3 Medical Assistant Credentials 5
- 1.4 Training Programs 7
- 1.5 Professional Development 8
- **PROCEDURE 1-1: Obtaining Certification/Registration Information Through the Internet** 9

CHAPTER 2

Healthcare and the Healthcare Team 12

- 2.1 Healthcare Trends 13
- 2.2 Medical Specialties 15
- 2.3 Working with Other Healthcare Professionals 18
- 2.4 Specialty Career Options 21
- 2.5 Healthcare Professional Associations 24

CHAPTER 3

Professionalism and Success 28

- 3.1 Professionalism in Medical Assisting 29
- 3.2 Professional Behaviors 30
- 3.3 Strategies for Success 35
- **PROCEDURE 3-1: Self-Evaluation of Professional Behaviors** 39

CHAPTER 4

Interpersonal Communication 43

- **ACTIVSIM: Cindy Chen** 43
- 4.1 Elements of Communication 45

- 4.2 Human Behavior and Needs 46
- 4.3 Types of Communication 48
- 4.4 Improving Your Communication Skills 49
- 4.5 Therapeutic Communication Skills 50
- 4.6 Communicating in Special Circumstances 52
 - **SKILLS VIDEO: Communicating with the Anxious Patient** 52
 - **SKILLS VIDEO: Communicating Effectively with Patients from Other Cultures and Meeting their Needs for Privacy** 54
- 4.7 Communicating with Coworkers 56
 - **PROCEDURE 4-1: Communicating with the Anxious Patient** 57
 - **PROCEDURE 4-2: Communicating with the Angry Patient** 58
 - **PROCEDURE 4-3: Communicating with the Assistance of an Interpreter** 58
 - **PRACTICE MEDICAL OFFICE: Admin: Check In – Interactions** 61

CHAPTER 5

Legal and Ethical Issues 62

- **ACTIVSIM: Cindy Chen** 62
- 5.1 Laws and Ethics 64
- 5.2 The Physician-Patient Contract 66
- 5.3 Preventing Malpractice Claims 69
- 5.4 Administrative Procedures and the Law 73
- 5.5 Federal Legislation Affecting Healthcare 76
- 5.6 Confidentiality Issues and Mandatory Disclosure 83
- 5.7 Ethics 85
- 5.8 Legal Medical Practice Models 86
 - **PROCEDURE 5-1: Obtaining Signature for Notice of Privacy Practices and Acknowledgment** 88
 - **PROCEDURE 5-2: Completing a Privacy Violation Complaint Form** 88
 - **PROCEDURE 5-3: Obtaining Authorization to Release Health Information** 89
 - **PRACTICE MEDICAL OFFICE: Admin: Check In – Privacy and Liability** 92

UNIT TWO

Safety and the Environment

CHAPTER 6

Infection Control Fundamentals 93

- **ACTIVSIM: Sheny Jones** 93
- 6.1 Occupational Safety and Health Administration 94

6.2 The Cycle of Infection 95

► **SKILLS VIDEO:** Aseptic Hand Hygiene 98

6.3 OSHA Bloodborne Pathogens Standard and Universal Precautions 98

6.4 Transmission-Based Precautions 103

6.5 OSHA-Required Education and Training 104

► **PROCEDURE 6-1:** Aseptic Handwashing 105

► **PROCEDURE 6-2:** Using an Alcohol-Based Hand Disinfectant 106

► **PROCEDURE 6-3:** Using a Biohazardous Sharps Container 106

► **PROCEDURE 6-4:** Disposing of Biohazardous Waste 106

► **PRACTICE MEDICAL OFFICE:** Admin: Check In – Office Operations 108

CHAPTER 7

Safety and Patient Reception 109

► **ACTIVSIM:** Peter Smith 109

7.1 The Medical Office Safety Plan 111

7.2 OSHA Hazard Communication Standard 111

7.3 Electrical Safety 112

7.4 Fire Safety 113

7.5 Chemical Safety 115

7.6 Ergonomics and Physical Safety 116

7.7 Preventing Injury in the Front Office 118

7.8 Design of the Reception Area 120

7.9 The Importance of Cleanliness 123

7.10 Office Access for All 125

7.11 Functions of the Reception Staff 128

7.12 Opening and Closing the Office 129

► **PROCEDURE 7-1:** Handling a Fire Emergency 130

► **PROCEDURE 7-2:** Maintaining and Using an Eyewash Station 132

► **PROCEDURE 7-3:** Creating a Pediatric Reception Area 132

► **PROCEDURE 7-4:** Creating a Reception Area Accessible to Patients with Special Needs 133

► **PROCEDURE 7-5:** Opening and Closing the Medical Office 133

► **PRACTICE MEDICAL OFFICE:** Admin: Check In – Work Task Proficiencies 137

CHAPTER 8

Office Equipment and Supplies 138

8.1 Computers 139

8.2 Components of the Computer 141

8.3 Software 143

8.4 Software Training 146

8.5 Selecting Computer Equipment 147

8.6 Computer System Care and Maintenance 148

8.7 Security in the Computerized Office 148

8.8 Administrative Medical Office Equipment 149

8.9 Purchasing Decisions for Office Equipment 154

8.10 Maintaining Office Equipment 155

8.11 Maintaining Medical Office Supplies 157

8.12 Taking a Supply Inventory 160

► **SKILLS VIDEO:** Establishing and Conducting the Supply Inventory and Receiving Supplies 160

8.13 Ordering Supplies 162

► **PROCEDURE 8-1:** Using a Facsimile (Fax) Machine 169

► **PROCEDURE 8-2:** Using a Photocopier Machine 169

► **PROCEDURE 8-3:** Using a Postage Meter 170

► **PROCEDURE 8-4:** Using a Check-Writing Machine 170

► **PROCEDURE 8-5:** Step-by-Step Overview of Inventory Procedures 171

► **ELECTRONIC HEALTH RECORDS:** Reminders for Ordering Office Supplies 174

► **ELECTRONIC HEALTH RECORDS:** Working with the Task Feature 174

► **ELECTRONIC HEALTH RECORDS:** Task Sequencing 174

► **PRACTICE MEDICAL OFFICE:** Admin: Check In – Office Operations 174

CHAPTER 9

Examination and Treatment Areas 175

► **ACTIVSIM:** Shenya Jones 175

9.1 The Exam Room 176

9.2 Sanitization and Disinfection 177

► **SKILLS VIDEO:** Guidelines for Disinfecting Exam Room Surfaces 180

9.3 Preparation of the Exam and Treatment Areas 180

9.4 Room Temperature, Lighting, and Ventilation 182

9.5 Medical Instruments and Supplies 183

► **PROCEDURE 9-1:** Performing Sanitization with an Ultrasonic Cleaner 186

► **PROCEDURE 9-2:** Guidelines for Disinfecting Exam Room Surfaces 186

► **PRACTICE MEDICAL OFFICE:** Clinical – Office Operations 189

UNIT THREE

Communication

CHAPTER 10

Written and Electronic Communication 190

► **ACTIVSIM:** Valarie Ramirez 190

10.1 Professionalism and Document Preparation 191

10.2 Selecting Document Supplies	191
10.3 Effective Writing	193
10.4 Medical Office Documents and Correspondence	195
10.5 Written Communication Using Electronic Format	198
10.6 Editing and Proofreading	203
10.7 Preparing Outgoing Mail	205
10.8 Mailing Options	209
10.9 Processing Incoming Mail	212
► PROCEDURE 10-1: Creating a Professional Letter	213
► PROCEDURE 10-2: Writing an Interoffice Memo	214
► PROCEDURE 10-3: Composing a Professional E-mail Message	214
► PROCEDURE 10-4: Composing an Electronic Patient Letter	215
► PROCEDURE 10-5: Sorting and Opening Mail	215
► ELECTRONIC HEALTH RECORDS: Creating a Patient Letter	218
► ELECTRONIC HEALTH RECORDS: Creating a Letter to Referring Physician	218
► ELECTRONIC HEALTH RECORDS: Drafting an Email to a Patient	218
► PRACTICE MEDICAL OFFICE: Admin: Check In – Privacy and Liability	218

CHAPTER 11

Medical Records and Documentation 219

► ACTIVSIM: Mohammad Nassar	219
11.1 The Importance of Medical Records	220
11.2 Contents of Patient Medical Records	222
► SKILLS VIDEO: Registering a New Patient	222
► SKILLS VIDEO: Initiating a Paper-Based Patient Medical Record	227
11.3 Types of Medical Records	229
11.4 Documentation and the 6 Cs of Charting	232
11.5 Appearance, Timeliness, and Accuracy of Records	234
11.6 Correcting and Updating Medical Records	236
► SKILLS VIDEO: Correcting the Patient Medical Record	236
11.7 Responding to Release of Records Request	237
► PROCEDURE 11-1: Preparing a New Patient Paper Medical Record	239
► PROCEDURE 11-2: Correcting Paper Medical Records	239
► PROCEDURE 11-3: Entering (Adding) Information into a Paper Medical Record	240
► ELECTRONIC HEALTH RECORDS: Updating a Patient's Chart	243
► ELECTRONIC HEALTH RECORDS: Updating Patient Demographics	243
► PRACTICE MEDICAL OFFICE: Admin: Check In – Privacy and Liability	243

CHAPTER 12

Electronic Health Records 244

► ACTIVSIM: Ken Washington	244
12.1 A Brief History of Electronic Medical Records	245
12.2 Electronic Records	245
12.3 Meaningful Use and the EHR	247
12.4 Advantages and Disadvantages of EHR Programs	248
12.5 Working with an Electronic Health Record	249
12.6 Other Functions of EHR Programs	250
12.7 Security and Confidentiality and EHR	253
► SKILLS VIDEO: PHI Authorization to Release Health Information	253
► PROCEDURE 12-1: Creating a New Patient Record Using EHR Software	254
► PROCEDURE 12-2: Making an Addition or Addendum (Correction) to an Electronic Health Record	254
► PROCEDURE 12-3: Creating an Appointment Matrix for an Electronic Scheduling System	255
► PROCEDURE 12-4: Scheduling a Patient Appointment Using an Electronic Scheduler	255
► ELECTRONIC HEALTH RECORDS: Reviewing a Face Sheet	258
► ELECTRONIC HEALTH RECORDS: Correcting Errors in EHR	258
► ELECTRONIC HEALTH RECORDS: Creating an Electronic Schedule Matrix	258
► ELECTRONIC HEALTH RECORDS: Scheduling a Patient Appointment	258
► PRACTICE MEDICAL OFFICE: Admin: Check Out – Privacy and Liability	258

CHAPTER 13

Managing Medical Records 259

13.1 Filing Equipment	260
13.2 Security and Safety Measures	261
13.3 Filing Supplies	262
13.4 Filing Systems	262
13.5 The Filing Process	267
13.6 Active, Inactive, and Closed Files	269
► PROCEDURE 13-1: Creating a Filing System for Paper Medical Records	271
► PROCEDURE 13-2: Setting Up an Office Tickler File	272
► PROCEDURE 13-3: Developing a Records Retention Program	272
► PRACTICE MEDICAL OFFICE: Admin: Check Out – Work Task Proficiencies	275

CHAPTER 14

Telephone Techniques 276

14.1 Telecommunications Equipment 277

14.2 Effective Telephone Communication 280

14.3 Telephone Etiquette 281

14.4 Types of Incoming Calls 283

▶ **SKILLS VIDEO: Manage a Prescription Refill** 284

14.5 Managing Incoming Calls 288

14.6 Taking Complete and Accurate Phone Messages 290

14.7 Placing Outgoing Calls 291

▶ **PROCEDURE 14-1: Using a Telecommunications Device for the Deaf (TDD)** 293

▶ **PROCEDURE 14-2: Renewing a Prescription by Telephone** 293

▶ **PROCEDURE 14-3: Screening and Routing Telephone Calls** 294

▶ **PROCEDURE 14-4: Handling Emergency Calls** 295

▶ **PROCEDURE 14-5: Retrieving Messages from an Answering Service or System** 296

▶ **ELECTRONIC HEALTH RECORDS: Documenting a Patient Message** 298

▶ **ELECTRONIC HEALTH RECORDS: Sending and Processing a Patient Message** 298

▶ **PRACTICE MEDICAL OFFICE: Admin: Check In – Office Operations** 298

UNIT FOUR

Administrative Practices

CHAPTER 15

Patient Education 299

▶ **ACTIVSIM: Sylvia Gonzales** 299

15.1 The Educated Patient 300

15.2 Learning and Teaching 301

15.3 Teaching Techniques 301

15.4 Patient Education Materials 302

15.5 Promoting Health and Wellness Through Education 306

15.6 The Patient Information Packet 308

15.7 Patient Education Prior to Surgery 311

▶ **PROCEDURE 15-1: Creating Electronic Patient Instructions** 314

▶ **PROCEDURE 15-2: Identifying Community Resources** 314

▶ **PROCEDURE 15-3: Locating Credible Patient Education Information on the Internet** 315

▶ **PROCEDURE 15-4: Developing a Patient Education Plan** 316

▶ **PROCEDURE 15-5: Outpatient Surgery Teaching** 316

▶ **ELECTRONIC HEALTH RECORDS: Administering Patient Educational Material** 319

▶ **ELECTRONIC HEALTH RECORDS: Documenting Administration of Patient Educational Material** 319

▶ **PRACTICE MEDICAL OFFICE: Admin: Check Out – Interactions** 319

CHAPTER 16

Schedule Management 320

▶ **ACTIVSIM: John Miller** 320

16.1 The Appointment Book 321

16.2 Applying the Matrix 322

16.3 Appointment Scheduling Systems 326

16.4 Organizing and Scheduling Appointments 329

16.5 Special Scheduling Situations 332

16.6 Scheduling Outside Appointments 335

▶ **SKILLS VIDEO: Scheduling Outpatient Surgical Appointments** 335

16.7 Maintaining the Practitioner's Schedule 336

▶ **SKILLS VIDEO: Scheduling Inpatient Surgical Appointments** 336

▶ **PROCEDURE 16-1: Creating an Appointment Matrix** 338

▶ **PROCEDURE 16-2: Scheduling Appointments** 339

▶ **PROCEDURE 16-3: Completing the Patient Appointment Card** 339

▶ **PROCEDURE 16-4: Placing Appointment Confirmation Calls** 340

▶ **PROCEDURE 16-5: Scheduling Outpatient Surgical Appointments** 340

▶ **PROCEDURE 16-6: Scheduling Inpatient Surgical Appointments** 341

▶ **ELECTRONIC HEALTH RECORDS: Scheduling an Appointment for a New Patient** 344

▶ **ELECTRONIC HEALTH RECORDS: Scheduling an Appointment for an Existing Patient** 344

▶ **ELECTRONIC HEALTH RECORDS: Blocking Appointment Times** 344

▶ **ELECTRONIC HEALTH RECORDS: Charting a No Show** 344

▶ **ELECTRONIC HEALTH RECORDS: Locating an Existing Appointment** 344

▶ **PRACTICE MEDICAL OFFICE: Admin: Check Out - Work Task Proficiencies** 344

CHAPTER 17

Insurance and Billing 345

▶ **ACTIVSIM: Sylvia Gonzales** 345

17.1 Basic Insurance Terminology 346

17.2 Private Health Plans 347

17.3 Government Plans 351

17.4 Payer Payment Systems 357

17.5 The Claims Process: An Overview 360

- ▶ **SKILLS VIDEO: Requesting Prior Authorization** 362
- 17.6 Preparing and Transmitting the Healthcare Claim 364
- 17.7 Transmitting Electronic Claims 373
- 17.8 Insurer Processing Claims and Payments 374
- ▶ **PROCEDURE 17-1: Verifying Workers' Compensation Coverage** 376
- ▶ **PROCEDURE 17-2: Submitting a Request for Prior Authorization** 377
- ▶ **PROCEDURE 17-3: Completing the CMS-1500 Claim Form** 377
- ▶ **PROCEDURE 17-4: Tracking Insurance Claims Submissions** 379
- ▶ **ELECTRONIC HEALTH RECORDS: Verifying a Patient's Insurance Coverage** 382
- ▶ **ELECTRONIC HEALTH RECORDS: Creating a Patient Referral** 382
- ▶ **ELECTRONIC HEALTH RECORDS: Creating a Routing Slip for Billing** 382
- ▶ **PRACTICE MEDICAL OFFICE: Admin: Check In – Work Task Proficiencies** 382

CHAPTER 18

Diagnostic Coding 383

- ▶ **ACTIVSIM: Cindy Chen** 383
- 18.1 The Reasons for Diagnosis Codes 384
- 18.2 A Basic Comparison of ICD-9-CM and ICD-10-CM 385
- 18.3 An Overview of ICD-10 387
- 18.4 Coding with ICD-10 391
- 18.5 External Cause of Injury and Health Status Codes 395
- 18.6 Synopsis of ICD-10 Coding Guidelines by Chapter 397
- ▶ **SKILLS VIDEO: Locating an ICD-10-CM Code** 403
- ▶ **PROCEDURE 18-1: Locating an ICD-10-CM Code** 403
- ▶ **PROCEDURE 18-2: Locating a Health Status (Z) Code** 403
- ▶ **PROCEDURE 18-3: Locating an External Cause Code** 404
- ▶ **ELECTRONIC HEALTH RECORDS: Using ICD-10 Diagnostic Codes** 406
- ▶ **ELECTRONIC HEALTH RECORDS: Maintaining the ICD-10 Database** 406
- ▶ **PRACTICE MEDICAL OFFICE: Admin: Check Out – Office Operations** 407

CHAPTER 19

Procedural Coding 408

- ▶ **ACTIVSIM: Raja Lautu** 408
- 19.1 The CPT Manual 409
- 19.2 General CPT Guidelines 411
- 19.3 Evaluation and Management Services 417
- 19.4 Surgical Coding 419

19.5 Using the CPT Manual 423

- ▶ **SKILLS VIDEO: Locating a CPT Code** 424
- 19.6 The HCPCS Coding Manual 424
- 19.7 Coding Compliance 424
- ▶ **PROCEDURE 19-1: Locating a CPT Code** 426
- ▶ **PROCEDURE 19-2: Locating a HCPCS Code** 426
- ▶ **PROCEDURE 19-3: Entering CPT/HCPCS and ICD Codes into an EHR Program** 427
- ▶ **ELECTRONIC HEALTH RECORDS: Using CPT Codes** 429
- ▶ **ELECTRONIC HEALTH RECORDS: Maintaining the CPT Database** 429
- ▶ **PRACTICE MEDICAL OFFICE: Admin: Check Out – Work Task Proficiencies** 430

CHAPTER 20

Patient Collections and Financial Management 431

- 20.1 The Medical Practice as a Business 433
- 20.2 Medical Office Accounting Methods 433
- 20.3 In-Office Transactions 437
- 20.4 Standard Billing Procedures 441
- 20.5 Standard Collection Procedures 443
- ▶ **SKILLS VIDEO: Posting Charges, Payments, and Adjustments** 445
- 20.6 Laws That Govern Credit and Collections 446
- 20.7 Credit Arrangements 448
- 20.8 Common Collection Problems 450
- 20.9 Banking and Negotiable Instruments 452
- 20.10 Preparing a Bank Deposit 454
- 20.11 Reconciling the Bank Statement 455
- 20.12 Electronic Banking 457
- 20.13 Accounts Payable and Managing Disbursements 458
- ▶ **PROCEDURE 20-1: Posting Charges, Payments, and Adjustments** 460
- ▶ **PROCEDURE 20-2: Using the Superbill as Bill/Receipt** 461
- ▶ **PROCEDURE 20-3: Posting a Nonsufficient Funds (NSF) Check** 461
- ▶ **PROCEDURE 20-4: Processing a Payment Resulting in a Credit Balance** 462
- ▶ **PROCEDURE 20-5: Processing Refunds to Patients** 462
- ▶ **PROCEDURE 20-6: Preparing an Age Analysis** 462
- ▶ **PROCEDURE 20-7: Referring an Account to a Collection Agency and Posting the Payment from the Agency** 463
- ▶ **PROCEDURE 20-8: Completing a Truth in Lending Statement (Agreement)** 464
- ▶ **PROCEDURE 20-9: Making a Bank Deposit** 464
- ▶ **PROCEDURE 20-10: Reconciling the Bank Statement** 465
- ▶ **PROCEDURE 20-11: Setting Up the Disbursements Journal** 466
- ▶ **PRACTICE MEDICAL OFFICE: Admin: Check Out – Work Task Proficiencies** 469

UNIT FIVE

Applied Anatomy and Physiology

CHAPTER 21

Organization of the Body 470

► **ACTIVSIM:** John Miller 470

21.1 The Study of the Body 471

► **BODY ANIMAT3D:** Homeostasis 472

21.2 Structural Organization of the Body 472

21.3 Major Tissue Types 472

21.4 Body Organs and Systems 474

21.5 Understanding Medical Terminology 477

21.6 Anatomical Terminology 477

21.7 Body Cavities and Abdominal Regions 478

21.8 Chemistry of Life 479

► **BODY ANIMAT3D:** Basic Chemistry (Organic Molecules) 480

21.9 Cell Characteristics 482

► **BODY ANIMAT3D:** Fluid and Electrolyte Imbalances 482

► **BODY ANIMAT3D:** Cells and Tissues 484

21.10 Movement Through Cell Membranes 484

21.11 Cell Division 484

► **BODY ANIMAT3D:** Meiosis vs. Mitosis 485

21.12 Genetic Techniques 485

21.13 Heredity and Common Genetic Disorders 486

21.14 Pathophysiology: Common Genetic Disorders 487

CHAPTER 22

The Integumentary System 491

► **ACTIVSIM:** Christopher Matthews 491

22.1 Functions of the Integumentary System 492

22.2 Skin Structure 492

22.3 Skin Color 493

22.4 Skin Lesions 494

22.5 Accessory Organs 495

22.6 Skin Healing 497

► **BODY ANIMAT3D:** Inflammation 497

22.7 Pathophysiology: Common Diseases and Disorders of the Skin 498

► **BODY ANIMAT3D:** Burns 499

CHAPTER 23

The Skeletal System 506

► **ACTIVSIM:** John Miller 506

23.1 Bone Structure 507

23.2 Functions of Bones 509

23.3 Bone Growth 509

23.4 Bony Structures 511

23.5 The Skull 511

23.6 The Spinal Column 513

23.7 The Rib Cage 513

23.8 Bones of the Shoulders, Arms, and Hands 515

23.9 Bones of the Hips, Legs, and Feet 516

23.10 Joints 517

23.11 Pathophysiology: Common Diseases and Disorders of the Skeletal System 517

► **BODY ANIMAT3D:** Osteoarthritis vs. Rheumatoid Arthritis 518

► **BODY ANIMAT3D:** Osteoporosis 520

CHAPTER 24

The Muscular System 524

► **ACTIVSIM:** Ken Washington 524

24.1 Functions of Muscle 525

► **BODY ANIMAT3D:** Muscle Contraction 525

24.2 Muscle Cells and Tissue 525

24.3 Production of Energy for Muscle 527

24.4 Structure of Skeletal Muscles 528

24.5 Attachments and Actions of Skeletal Muscles 528

24.6 Major Skeletal Muscles 529

24.7 Aging and the Musculoskeletal System 535

24.8 Pathophysiology: Common Diseases and Disorders of the Muscular System 535

CHAPTER 25

The Cardiovascular System 540

► **ACTIVSIM:** John Miller 540

25.1 The Heart 541

25.2 Cardiac Cycle 543

► **BODY ANIMAT3D:** Cardiac Cycle 544

25.3 Blood Vessels 545

25.4 Circulation 548

25.5 Blood Pressure 549

25.6 Pathophysiology: Common Diseases and Disorders of the Cardiovascular System 551

► **BODY ANIMAT3D:** Hypertension 551

► **BODY ANIMAT3D:** Coronary Artery Disease (CAD) 552

► **BODY ANIMAT3D:** Heart Failure Overview 553

► **BODY ANIMAT3D:** Left-Side Heart Failure 553

► **BODY ANIMAT3D:** Right-Side Heart Failure 553

CHAPTER 26

The Blood 558

► **ACTIVSIM:** Cindy Chen 558

26.1 Components of Blood 559

- 26.2 Bleeding Control 562
- ▶ **BODY ANIMAT3D: Strokes** 563
- 26.3 ABO Blood Types 563
- 26.4 The Rh Factor 563
- 26.5 Pathophysiology: Common Diseases and Disorders of the Blood System 565

CHAPTER 27

The Lymphatic and Immune Systems 570

- ▶ **ACTIVSIM: Cindy Chen** 570
- 27.1 The Lymphatic System 571
- ▶ **BODY ANIMAT3D: Lymph and Lymph Node Circulation** 572
- 27.2 Defenses Against Disease 574
- 27.3 Antibodies 576
- 27.4 Immune Responses and Acquired Immunities 576
- 27.5 Pathophysiology: Common Diseases and Disorders of the Immune System 578
- ▶ **BODY ANIMAT3D: Immune Response: Hypersensitivity** 579
- ▶ **BODY ANIMAT3D: Inflammation** 582

CHAPTER 28

The Respiratory System 584

- ▶ **ACTIVSIM: Mohammad Nassar** 584
- 28.1 Organs of the Respiratory System 585
- 28.2 The Mechanisms of Breathing 588
- ▶ **BODY ANIMAT3D: Acid-Base Balance: Acidosis** 589
- ▶ **BODY ANIMAT3D: Acid-Base Balance: Alkalosis** 589
- 28.3 The Transport of Oxygen and Carbon Dioxide in the Blood 589
- ▶ **BODY ANIMAT3D: Oxygen Transport and Gas Exchange** 589
- 28.4 Respiratory Volumes 589
- 28.5 Pathophysiology: Common Diseases and Disorders of the Respiratory System 591
- ▶ **BODY ANIMAT3D: Asthma** 591
- ▶ **BODY ANIMAT3D: COPD** 592
- ▶ **BODY ANIMAT3D: Respiratory Tract Infections** 592
- ▶ **BODY ANIMAT3D: Respiratory Failure** 592

CHAPTER 29

The Nervous System 599

- 29.1 General Functions of the Nervous System 600
- 29.2 Neuron Structure 600
- 29.3 Nerve Impulse and Synapse 601
- ▶ **BODY ANIMAT3D: Nerve Impulse** 601
- 29.4 Central Nervous System 602
- 29.5 Peripheral Nervous System 606

- ▶ **BODY ANIMAT3D: Spinal Cord Injury** 606

29.6 Neurologic Testing 609

29.7 Pathophysiology: Common Diseases and Disorders of the Nervous System 611

- ▶ **BODY ANIMAT3D: Alzheimer's Disease** 611
- ▶ **BODY ANIMAT3D: Strokes** 616

CHAPTER 30

The Urinary System 617

- ▶ **ACTIVSIM: Peter Smith** 617
- 30.1 The Kidneys 618
- 30.2 Urine Formation 619
- 30.3 The Ureters, Urinary Bladder, and Urethra 621
- 30.4 Pathophysiology: Common Diseases and Disorders of the Urinary System 623
- ▶ **BODY ANIMAT3D: Renal Function** 623

CHAPTER 31

The Reproductive Systems 626

- ▶ **ACTIVSIM: Raja Lautu** 626
- 31.1 The Male Reproductive System 627
- 31.2 Pathophysiology: Common Diseases and Disorders of the Male Reproductive System 631
- ▶ **BODY ANIMAT3D: Prostate Cancer** 632
- 31.3 The Female Reproductive System 633
- 31.4 Pathophysiology: Common Diseases and Disorders of the Female Reproductive System 636
- ▶ **BODY ANIMAT3D: Breast Cancer** 636
- 31.5 Pregnancy 638
- 31.6 The Birth Process 640
- 31.7 Contraception 642
- 31.8 Infertility 644
- 31.9 Pathophysiology: Sexually Transmitted Infections Occurring in Both Sexes 644
- ▶ **BODY ANIMAT3D: Meiosis vs Mitosis** 648

CHAPTER 32

The Digestive System 649

- ▶ **ACTIVSIM: Sylvia Gonzales** 649
- 32.1 Characteristics of the Alimentary Canal 650
- 32.2 Characteristics of the Digestive Accessory Organs 656
- ▶ **BODY ANIMAT3D: Food Absorption** 656
- 32.3 The Absorption of Nutrients 657
- 32.4 Pathophysiology: Common Diseases and Disorders of the Digestive System 659
- ▶ **BODY ANIMAT3D: Liver Failure** 659

CHAPTER 33

The Endocrine System 664

▶ **ACTIVSIM:** Ken Washington 664

33.1 Hormones 665

33.2 Hormone Production 667

33.3 The Stress Response 670

33.4 Pathophysiology: Common Diseases and Disorders of the Endocrine System 670

▶ **BODY ANIMAT3D:** Type 1 Diabetes 672

▶ **BODY ANIMAT3D:** Type 2 Diabetes 672

▶ **BODY ANIMAT3D:** Hyperthyroidism 674

CHAPTER 34

Special Senses 677

▶ **ACTIVSIM:** Valarie Ramirez 677

34.1 The Nose and the Sense of Smell 678

34.2 The Tongue and the Sense of Taste 679

34.3 The Eye and the Sense of Sight 680

34.4 Visual Pathways 682

34.5 Pathophysiology: Common Diseases of the Eyes 684

34.6 The Ear and the Senses of Hearing and Equilibrium 685

34.7 The Hearing Process 686

▶ **BODY ANIMAT3D:** Hearing Loss: Sensorineural 687

34.8 Pathophysiology: Common Diseases and Disorders of the Ears 688

UNIT SIX

Clinical Practices

CHAPTER 35

Infection Control Practices 692

▶ **ACTIVSIM:** Ken Washington 692

35.1 Healthcare-Associated Infections 693

35.2 Infection Control Methods 695

▶ **SKILLS VIDEO:** Applying Standard Precautions 698

35.3 Safe Injection Practices and Sharps Safety 698

35.4 Respiratory Hygiene/Cough Etiquette Practices 699

35.5 Infection Control Practices with Medical Equipment 701

35.6 Surgical Site Infections (SSIs) 701

35.7 Sterilization 702

▶ **SKILLS VIDEO:** Wrapping and Labeling Instruments for Sterilization in the Autoclave 703

35.8 Reporting Guidelines for Infectious Diseases 706

▶ **PROCEDURE 35-1:** Removing Contaminated Gloves 707

▶ **PROCEDURE 35-2:** Removing a Contaminated Gown 708

▶ **PROCEDURE 35-3:** Wrapping and Labeling Instruments for Sterilization in the Autoclave 708

▶ **PROCEDURE 35-4:** Running a Load Through the Autoclave 709

▶ **PROCEDURE 35-5:** Notifying State and County Agencies About Reportable Diseases 710

▶ **PRACTICE MEDICAL OFFICE:** Admin: Check Out – Privacy & Liability 714

CHAPTER 36

Patient Interview and History 715

▶ **ACTIVSIM:** Peter Smith 715

36.1 The Patient Interview and History 716

▶ **SKILLS VIDEO:** Using Critical Thinking Skills During an Interview 720

36.2 Your Role as an Observer 720

36.3 Documenting Patient Information 722

36.4 Recording the Patient's Medical History 727

▶ **SKILLS VIDEO:** Obtaining a Medical History 730

▶ **PROCEDURE 36-1:** Using Critical Thinking Skills During an Interview 733

▶ **PROCEDURE 36-2:** Using a Progress Note 734

▶ **PROCEDURE 36-3:** Obtaining a Medical History 734

▶ **ELECTRONIC HEALTH RECORDS:** Building a Patient's Face Sheet 736

▶ **ELECTRONIC HEALTH RECORDS:** Printing a Patient's Face Sheet 736

▶ **ELECTRONIC HEALTH RECORDS:** Documenting in a Patient's Progress Note 736

▶ **PRACTICE MEDICAL OFFICE:** Clinical – Interactions 736

CHAPTER 37

Vital Signs and Measurements 737

▶ **ACTIVSIM:** Mohammad Nassar 737

37.1 Vital Signs 738

37.2 Temperature 738

▶ **SKILLS VIDEO:** Measuring and Recording Temperature 742

37.3 Pulse and Respiration 742

▶ **SKILLS VIDEO:** Measuring and Recording Pulse and Respirations 744

37.4 Blood Pressure 745

▶ **SKILLS VIDEO:** Taking the Blood Pressure of Adults and Older Children 747

37.5 Orthostatic, or Postural, Vital Signs 747

37.6 Body Measurements 747

▶ **SKILLS VIDEO:** Measuring Adults and Children 748

- ▶ **PROCEDURE 37-1:** Measuring and Recording Temperature 749
- ▶ **PROCEDURE 37-2:** Measuring and Recording Pulse and Respirations 750
- ▶ **PROCEDURE 37-3:** Taking the Blood Pressure of Adults and Older Children 751
- ▶ **PROCEDURE 37-4:** Measuring Adults and Children 752
- ▶ **ELECTRONIC HEALTH RECORDS:** Documenting Vital Signs 755
- ▶ **ELECTRONIC HEALTH RECORDS:** Adding Vital Signs as Part of an Office Visit 755
- ▶ **ELECTRONIC HEALTH RECORDS:** Recording Vital Signs for Pediatric Patients 755
- ▶ **ELECTRONIC HEALTH RECORDS:** Viewing Vital Signs in a Patient's Chart 755
- ▶ **BODY ANIMAT3D:** Hypertension 755
- ▶ **PRACTICE MEDICAL OFFICE:** Clinical – Office Operations 755

CHAPTER 38

Assisting with a General Physical Examination 756

- ▶ **ACTIVSIM:** Valarie Ramirez 756
- 38.1 The Purpose of a General Physical Exam 757
- 38.2 The Role of the Medical Assistant 758
- 38.3 Safety Precautions 758
- 38.4 Preparing the Patient for an Exam 758
- 38.5 Positioning and Draping 759
- ▶ **SKILLS VIDEO:** Positioning the Patient for an Exam 762
- 38.6 Special Patient Considerations 762
- ▶ **SKILLS VIDEO:** Transferring a Patient in a Wheelchair for an Exam 762
- 38.7 Exam Methods 762
- 38.8 Components of a General Physical Exam 763
- ▶ **SKILLS VIDEO:** Assisting with a General Physical Exam 764
- 38.9 After the Exam 767
- ▶ **PROCEDURE 38-1:** Positioning a Patient for an Exam 767
- ▶ **PROCEDURE 38-2:** Communicating Effectively with Patients from Other Cultures and Meeting Their Needs for Privacy 768
- ▶ **PROCEDURE 38-3:** Transferring a Patient in a Wheelchair for an Exam 769
- ▶ **PROCEDURE 38-4:** Assisting with a General Physical Exam 770
- ▶ **SKILLS VIDEO:** Communicating Effectively with Patients from Other Cultures and Meeting Their Needs for Privacy 774
- ▶ **ELECTRONIC HEALTH RECORDS:** Documenting a Physical Exam 774
- ▶ **ELECTRONIC HEALTH RECORDS:** Documenting a Procedure 774
- ▶ **PRACTICE MEDICAL OFFICE:** Clinical – Interactions 774

CHAPTER 39

Assisting in Reproductive and Urinary Specialties 775

- ▶ **ACTIVSIM:** Raja Lautu 775
- 39.1 Assisting with the Gynecologic Patient 776
- ▶ **SKILLS VIDEO:** Assisting with the Gynecological Exam 779
- 39.2 Assisting with the Obstetric Patient 779
- 39.3 OB/GYN Diagnostic and Therapeutic Tests and Procedures 782
- ▶ **SKILLS VIDEO:** Pregnancy Testing Using the EIA Method 783
- 39.4 Assisting in Urology 788
- 39.5 Urologic Diagnostic Tests and Procedures 788
- 39.6 Diseases and Disorders of the Reproductive and Urinary Systems 789
- ▶ **PROCEDURE 39-1:** Assisting with a Gynecologic Exam 792
- ▶ **PROCEDURE 39-2:** Assisting During the Exam of a Pregnant Patient 794
- ▶ **PROCEDURE 39-3:** Assisting with a Cervical Biopsy 794
- ▶ **BODY ANIMAT3D:** Breast Cancer 797
- ▶ **BODY ANIMAT3D:** Prostate Cancer 797
- ▶ **PRACTICE MEDICAL OFFICE:** Clinical – Interactions 797

CHAPTER 40

Assisting in Pediatrics 798

- ▶ **ACTIVSIM:** Chris Matthews 798
- 40.1 Developmental Stages and Care 799
- 40.2 Pediatric Examinations 808
- 40.3 Pediatric Immunizations 810
- 40.4 Pediatric Screening and Diagnostic Tests 813
- ▶ **SKILLS VIDEO:** Measuring Infants 814
- 40.5 Pediatric Diseases and Disorders 817
- 40.6 Pediatric Patient Special Concerns 820
- ▶ **PROCEDURE 40-1:** Measuring Infants 822
- ▶ **PROCEDURE 40-2:** Maintaining Growth Charts 823
- ▶ **PROCEDURE 40-3:** Collecting a Urine Specimen from a Pediatric Patient 825
- ▶ **SKILLS VIDEO:** Measuring Adults and Children 827
- ▶ **PRACTICE MEDICAL OFFICE:** Clinical – Interactions 828

CHAPTER 41

Assisting in Geriatrics 829

- ▶ **ACTIVSIM:** Peter Smith 829
- 41.1 The Geriatric Patient 830
- 41.2 Diseases and Disorders of Geriatric Patients 833
- 41.3 Assisting with Geriatric Care 833

- ▶ **SKILLS VIDEO:** Obtaining Information from a Geriatric Patient 835
- 41.4 Geriatric Patient Special Concerns 838
- ▶ **PROCEDURE 41-1:** Educating Adult Patients About Daily Water Requirements 841
- ▶ **BODY ANIMAT3D:** Alzheimer's Disease 844
- ▶ **PRACTICE MEDICAL OFFICE:** Clinical – Interactions 844

CHAPTER 42

Assisting in Other Medical Specialties 845

- ▶ **ACTIVSIM:** Valarie Ramirez 845
- 42.1 Working in Other Medical Specialties 846
- 42.2 Diseases and Disorders of Medical Specialties 850
- 42.3 Exams and Procedures in Medical Specialties 853
- ▶ **PROCEDURE 42-1:** Assisting with a Scratch Test Examination 862
- ▶ **PROCEDURE 42-2:** Assisting with a Sigmoidoscopy 863
- ▶ **PROCEDURE 42-3:** Assisting with a Needle Biopsy 864
- ▶ **BODY ANIMAT3D:** Coronary Artery Disease 866
- ▶ **PRACTICE MEDICAL OFFICE:** Clinical – Interactions 866

CHAPTER 43

Assisting with Eye and Ear Care 867

- ▶ **ACTIVSIM:** Valarie Ramirez 867
- 43.1 Ophthalmology 869
- 43.2 Eye Diseases and Disorders 869
- 43.3 Ophthalmic Exams 872
- ▶ **SKILLS VIDEO:** Performing Vision Screening Tests 874
- 43.4 Ophthalmologic Procedures and Treatments 874
- 43.5 Otology 875
- 43.6 Ear Diseases and Disorders 875
- ▶ **SKILLS VIDEO:** Obtaining Information from a Patient with a Hearing Aid 879
- 43.7 Hearing and Other Diagnostic Ear Tests 879
- ▶ **SKILLS VIDEO:** Measuring Auditory Acuity 880
- 43.8 Ear Treatments and Procedures 880
- ▶ **SKILLS VIDEO:** Performing Ear Irrigation 881
- ▶ **PROCEDURE 43-1:** Preparing the Ophthalmoscope for Use 883
- ▶ **PROCEDURE 43-2:** Performing Vision Screening Tests 883
- ▶ **PROCEDURE 43-3:** Administering Eye Medications 886
- ▶ **PROCEDURE 43-4:** Performing Eye Irrigation 888
- ▶ **PROCEDURE 43-5:** Measuring Auditory Acuity 889
- ▶ **PROCEDURE 43-6:** Administering Eardrops 890
- ▶ **PROCEDURE 43-7:** Performing Ear Irrigation 891
- ▶ **BODY ANIMAT3D:** Hearing Loss: Sensorineural 894
- ▶ **PRACTICE MEDICAL OFFICE:** Clinical – Work Task Proficiencies and Clinical – Interactions 894

CHAPTER 44

Assisting with Minor Surgery 895

- ▶ **ACTIVSIM:** Peter Smith 895
- 44.1 The Medical Assistant's Role in Minor Surgery 896
- 44.2 Surgery in the Physician's Office 897
- ▶ **BODY ANIMAT3D:** Wound Healing 898
- 44.3 Instruments Used in Minor Surgery 900
- 44.4 Asepsis 904
- ▶ **SKILLS VIDEO:** Creating a Sterile Field 905
- ▶ **SKILLS VIDEO:** Performing a Surgical Scrub 907
- ▶ **SKILLS VIDEO:** Donning Sterile Gloves 907
- 44.5 Preoperative Procedures 907
- 44.6 Intraoperative Procedures 909
- 44.7 Postoperative Procedures 912
- ▶ **SKILLS VIDEO:** Assisting after Minor Surgical Procedures 913
- ▶ **SKILLS VIDEO:** Suture Removal 913
- ▶ **PROCEDURE 44-1:** Creating a Sterile Field 913
- ▶ **PROCEDURE 44-2:** Performing a Surgical Scrub 914
- ▶ **PROCEDURE 44-3:** Donning Sterile Gloves 915
- ▶ **PROCEDURE 44-4:** Assisting as a Floater (Unsterile Assistant) During Minor Surgical Procedures 916
- ▶ **PROCEDURE 44-5:** Assisting as a Sterile Scrub Assistant During Minor Surgical Procedures 917
- ▶ **PROCEDURE 44-6:** Assisting After Minor Surgical Procedures 917
- ▶ **PROCEDURE 44-7:** Suture Removal 918
- ▶ **PRACTICE MEDICAL OFFICE:** Clinical – Work Task Proficiencies 921

UNIT SEVEN

Assisting with Diagnostics

CHAPTER 45

Orientation to the Lab 922

- ▶ **ACTIVSIM:** Sylvia Gonzales 922
- 45.1 The Role of Laboratory Testing in Patient Care 923
- 45.2 The Medical Assistant's Role 924
- 45.3 Use of Laboratory Equipment 924
- ▶ **SKILLS VIDEO:** Using a Microscope 926
- 45.4 Safety in the Laboratory 927
- 45.5 Quality Assurance Programs 928
- 45.6 Communicating with the Patient 935
- 45.7 Recordkeeping 936
- ▶ **PROCEDURE 45-1:** Using a Microscope 938
- ▶ **PRACTICE MEDICAL OFFICE:** Clinical – Privacy and Liability 942

CHAPTER 46

Microbiology and Disease 943

▶ **ACTIVSIM:** Cindy Chen 943

46.1 Microbiology and the Role of the Medical Assistant 944

46.2 How Microorganisms Cause Disease 944

46.3 Classification and Naming of Microorganisms 945

46.4 Viruses 946

46.5 Bacteria 949

46.6 Protozoans 953

46.7 Fungi 955

46.8 Multicellular Parasites 955

46.9 How Infections Are Diagnosed 957

46.10 Specimen Collection 957

▶ **SKILLS VIDEO:** Obtaining a Throat Culture Specimen 960

46.11 Transporting Specimens to an Outside Laboratory 961

46.12 Direct Examination of Specimens 961

46.13 Preparation and Examination of Stained Specimens 962

46.14 Culturing Specimens in the Medical Office 962

▶ **PROCEDURE 46-1:** Obtaining a Throat Culture Specimen 966

▶ **PROCEDURE 46-2:** Performing a Quick Strep A Test on a Throat Specimen 967

▶ **PROCEDURE 46-3:** Preparing Microbiologic Specimens for Transport to an Outside Laboratory 967

▶ **PROCEDURE 46-4:** Preparing a Microbiologic Specimen Smear 968

▶ **PROCEDURE 46-5:** Performing a Gram Stain 968

▶ **PRACTICE MEDICAL OFFICE:** Admin: Check Out – Privacy and Liability 972

CHAPTER 47

Collecting, Processing, and Testing Urine and Stool Specimens 973

▶ **ACTIVSIM:** Ken Washington 973

47.1 The Role of the Medical Assistant 974

47.2 Obtaining Urine Specimens 975

▶ **SKILLS VIDEO:** Collecting a Clean-Catch Midstream Urine Specimen 976

47.3 Urinalysis 980

▶ **SKILLS VIDEO:** Performing a Reagent Strip Test 984

▶ **SKILLS VIDEO:** Pregnancy Testing Using the EIA Method 986

47.4 Collecting and Processing Stool Specimens 988

▶ **PROCEDURE 47-1:** Collecting a Clean-Catch Mid-Stream Urine Specimen 990

▶ **PROCEDURE 47-2:** Collecting a 24-Hour Urine Specimen 991

▶ **PROCEDURE 47-3:** Establishing Chain of Custody for a Urine Specimen 992

▶ **PROCEDURE 47-4:** Measuring Specific Gravity with a Refractometer 993

▶ **PROCEDURE 47-5:** Performing a Reagent Strip Test 993

▶ **PROCEDURE 47-6:** Pregnancy Testing Using the EIA Method 994

▶ **PROCEDURE 47-7:** Processing a Urine Specimen for Microscopic Examination of Sediment 995

▶ **PROCEDURE 47-8:** Fecal Occult Blood Testing Using the Guaiac Testing Method 997

▶ **ELECTRONIC HEALTH RECORDS:** Ordering a Test 999

▶ **ELECTRONIC HEALTH RECORDS:** Recording Test Results 999

▶ **ELECTRONIC HEALTH RECORDS:** Processing Test Results 999

▶ **PRACTICE MEDICAL OFFICE:** Clinical – Interactions 999

CHAPTER 48

Collecting, Processing, and Testing Blood Specimens 1000

▶ **ACTIVSIM:** Sylvia Gonzales 1000

48.1 The Role of the Medical Assistant 1001

48.2 Preparation for Collecting Blood Specimens 1002

▶ **SKILLS VIDEO:** Quality Control Procedures for Blood Specimen Collection 1002

48.3 Patient Preparation and Communication 1008

48.4 Performing Blood Collection 1011

48.5 Performing Common Blood Tests 1013

▶ **SKILLS VIDEO:** Preparing a Blood Smear Slide 1020

▶ **SKILLS VIDEO:** Measuring Hematocrit Percentage after Centrifuge 1020

▶ **SKILLS VIDEO:** Measuring Blood Glucose Using a Handheld Glucometer 1022

▶ **PROCEDURE 48-1:** Quality Control Procedures for Blood Specimen Collection 1024

▶ **PROCEDURE 48-2:** Performing Venipuncture Using an Evacuated System 1025

▶ **PROCEDURE 48-3:** Performing Capillary Puncture 1027

▶ **PROCEDURE 48-4:** Preparing a Blood Smear Slide 1029

▶ **PROCEDURE 48-5:** Measuring Hematocrit Percentage After Centrifuge 1030

▶ **PROCEDURE 48-6:** Measuring Blood Glucose Using a Handheld Glucometer 1032

▶ **PROCEDURE 48-7:** Performing a Rapid Infectious Mononucleosis Test 1032

▶ **ELECTRONIC HEALTH RECORDS:** Sending a Patient's Test Report 1034

▶ **ELECTRONIC HEALTH RECORDS:** Creating a Patient Order Form 1034

▶ **PRACTICE MEDICAL OFFICE:** Clinical – Work Task Proficiencies 1035

CHAPTER 49

Electrocardiography and Pulmonary Function Testing 1036

▶ **ACTIVSIM:** John Miller 1036

49.1 The Medical Assistant's Role in Electrocardiography and Pulmonary Function Testing 1037

49.2 Basic Principles of Electrocardiography 1037

49.3 The Electrocardiograph 1039

49.4 Performing an ECG 1042

▶ **SKILLS VIDEO:** Obtaining an ECG 1050

49.5 Exercise Electrocardiography (Stress Testing) and Echocardiography 1050

49.6 Ambulatory Electrocardiography (Holter Monitoring) 1052

▶ **SKILLS VIDEO:** Holter Monitoring 1052

49.7 Pulmonary Function Testing 1052

▶ **SKILLS VIDEO:** Measuring Forced Vital Capacity Using Spirometry 1055

▶ **SKILLS VIDEO:** Obtaining a Peak Expiratory Flow Rate 1056

49.8 Pulse Oximetry 1056

▶ **SKILLS VIDEO:** Obtaining a Pulse Oximetry Reading 1056

▶ **PROCEDURE 49-1:** Obtaining an ECG 1056

▶ **PROCEDURE 49-2:** Holter Monitoring 1057

▶ **PROCEDURE 49-3:** Measuring Forced Vital Capacity Using Spirometry 1059

▶ **PROCEDURE 49-4:** Obtaining a Peak Expiratory Flow Rate 1060

▶ **PROCEDURE 49-5:** Obtaining a Pulse Oximetry Reading 1061

▶ **PRACTICE MEDICAL OFFICE:** Clinical – Work Task Proficiencies 1064

CHAPTER 50

Diagnostic Imaging 1065

▶ **ACTIVSIM:** Raja Lautu 1065

50.1 Brief History of the X-ray 1066

50.2 Diagnostic Radiology 1066

50.3 The Medical Assistant's Role in Diagnostic Radiology 1067

50.4 Common Diagnostic Radiologic Tests 1069

50.5 Common Therapeutic Uses of Radiation 1077

50.6 Radiation Safety and Dose 1078

50.7 Electronic Medicine 1079

▶ **PROCEDURE 50-1:** Assisting with an X-ray Examination 1081

▶ **PROCEDURE 50-2:** Documentation and Filing Techniques for X-rays 1081

▶ **PRACTICE MEDICAL OFFICE:** Clinical – Interactions 1084

UNIT EIGHT

Assisting in Therapeutics

CHAPTER 51

Principles of Pharmacology 1085

51.1 The Medical Assistant's Role in Pharmacology 1086

51.2 Pharmacology 1087

▶ **BODY ANIMAT3D:** Pharmacokinetics vs. Pharmacodynamics 1088

▶ **BODY ANIMAT3D:** Medication Absorption 1088

▶ **BODY ANIMAT3D:** Medication Distribution 1088

▶ **BODY ANIMAT3D:** Medication Metabolism 1088

▶ **BODY ANIMAT3D:** Medication Excretion 1088

51.3 Drug Names and Categories 1090

51.4 FDA Regulation and Drugs 1090

51.5 Sources of Drug Information 1094

51.6 Controlled Substances 1095

51.7 Prescriptions 1099

▶ **SKILLS VIDEO:** Interpreting a Prescription 1101

51.8 Nonpharmacologic Pain Management 1102

51.9 Vaccines 1102

▶ **PROCEDURE 51-1:** Helping the Licensed Practitioner Comply with the Controlled Substances Act of 1970 1104

▶ **PROCEDURE 51-2:** Interpreting a Prescription 1104

▶ **SKILLS VIDEO:** Managing a Prescription Refill 1106

▶ **PRACTICE MEDICAL OFFICE:** Clinical – Privacy and Liability 1107

CHAPTER 52

Dosage Calculations 1108

▶ **ACTIVSIM:** Chris Matthews 1108

52.1 Ensuring Safe Dosage Calculations 1109

52.2 Measurement Systems 1110

52.3 Conversions Within and Between Measurement Systems 1111

52.4 Dosage Calculations 1112

52.5 Body Weight and Body Surface Area Calculations 1116

▶ **PRACTICE MEDICAL OFFICE:** Clinical – Privacy and Liability 1120

CHAPTER 53

Medication Administration 1121

▶ **ACTIVSIM:** John Miller 1121

53.1 Preparing to Administer a Drug 1122

53.2 Rights of Medication Administration 1125

53.3 Drug Routes and Equipment	1126
53.4 Medications by Mouth	1128
▶ SKILLS VIDEO: Administering Drugs by Mouth	1129
53.5 Medications by Injection	1129
▶ SKILLS VIDEO: Drawing a Drug from an Ampule	1130
▶ SKILLS VIDEO: Reconstituting and Drawing a Drug for Injection	1130
▶ SKILLS VIDEO: Giving an Intradermal Injection	1132
▶ SKILLS VIDEO: Giving a Subcutaneous Injection	1132
▶ SKILLS VIDEO: Giving an Intramuscular Injection	1132
53.6 Other Medication Routes	1134
53.7 Special Considerations	1134
53.8 Patient Education About Medications	1136
53.9 Charting Medications	1138
▶ PROCEDURE 53-1: Administering Oral Drugs	1139
▶ PROCEDURE 53-2: Administering Buccal or Sublingual Drugs	1141
▶ PROCEDURE 53-3: Drawing a Drug from an Ampule	1142
▶ PROCEDURE 53-4: Reconstituting and Drawing a Drug for Injection	1142
▶ PROCEDURE 53-5: Giving an Intradermal (ID) Injection	1143
▶ PROCEDURE 53-6: Giving a Subcutaneous (Subcut) Injection	1144
▶ PROCEDURE 53-7: Giving an Intramuscular (IM) Injection	1145
▶ PROCEDURE 53-8: Administering Inhalation Therapy	1146
▶ PROCEDURE 53-9: Administering and Removing a Transdermal Patch and Providing Patient Instruction	1147
▶ PROCEDURE 53-10: Assisting with Administration of a Urethral Drug	1148
▶ PROCEDURE 53-11: Administering a Vaginal Medication	1148
▶ PROCEDURE 53-12: Administering a Rectal Medication	1149
▶ ELECTRONIC HEALTH RECORDS: Documenting Medication Administration	1152
▶ ELECTRONIC HEALTH RECORDS: Managing Patient Prescriptions	1152
▶ PRACTICE MEDICAL OFFICE: Clinical – Office Operations	1152

CHAPTER 54

Physical Therapy and Rehabilitation 1153

▶ ACTIVSIM: Chris Matthews	1153
54.1 General Principles of Physical Therapy	1154
54.2 Cryotherapy and Thermotherapy	1157
54.3 Hydrotherapy	1160
54.4 Exercise Therapy	1161
54.5 Massage	1163
54.6 Traction	1164
54.7 Mobility Aids	1164

▶ SKILLS VIDEO: Teaching a Patient How to Use Crutches	1167
54.8 Referral to a Physical Therapist	1169
▶ PROCEDURE 54-1: Administering Cryotherapy	1169
▶ PROCEDURE 54-2: Administering Thermotherapy	1170
▶ PROCEDURE 54-3: Teaching a Patient How to Use a Cane	1171
▶ PROCEDURE 54-4: Teaching a Patient How to Use a Walker	1172
▶ PROCEDURE 54-5: Teaching a Patient How to Use Crutches	1172
▶ PRACTICE MEDICAL OFFICE: Clinical – Work Task Proficiencies	1175

CHAPTER 55

Nutrition and Health 1176

▶ ACTIVSIM: Mohammad Nassar	1176
55.1 Daily Energy Requirements	1177
55.2 Nutrients	1178
▶ BODY ANIMAT3D: Protein Synthesis	1179
55.3 Dietary Guidelines	1185
55.4 Assessing Nutritional Levels	1187
55.5 Modified Diets	1187
55.6 Patients with Specific Nutritional Needs	1189
▶ BODY ANIMAT3D: Digestion: Lactose Intolerance	1193
▶ BODY ANIMAT3D: Obesity	1194
55.7 Eating Disorders	1195
55.8 Patient Education	1196
▶ PROCEDURE 55-1: Teaching Patients How to Read Food Labels	1198
▶ PROCEDURE 55-2: Alerting Patients with Food Allergies to the Dangers of Common Foods	1199
▶ PRACTICE MEDICAL OFFICE: Admin: Check In – Interactions	1202

UNIT NINE

Medical Assisting Practice

CHAPTER 56

Practice Management 1203

▶ ACTIVSIM: Cindy Chen	1203
56.1 Organizational Design	1204
56.2 Managing the Medical Practice	1206
▶ SKILLS VIDEO: Petty Cash	1208
56.3 Human Resources and Practice Management	1210
56.4 Being a Leader	1213
56.5 Risk Management and Quality Assurance	1214
▶ SKILLS VIDEO: Completing an Incident Report	1216
56.6 Handling Payroll	1216

56.7 Calculating and Filing Taxes 1221

► **PROCEDURE 56-1: Preparing a Travel Expense Report** 1225

► **PROCEDURE 56-2: Preparing an Agenda** 1226

► **PROCEDURE 56-3: Completing an Incident Report** 1226

► **PROCEDURE 56-4: Generating Payroll** 1227

► **PRACTICE MEDICAL OFFICE: Admin: Check Out – Privacy and Liability** 1230

CHAPTER 57

Emergency Preparedness 1231

► **ACTIVSIM: Mohammad Nassar** 1231

57.1 Understanding Medical Emergencies 1232

57.2 Preparing for Medical Emergencies 1233

► **SKILLS VIDEO: Performing an Emergency Assessment** 1235

57.3 Accidental Injuries 1235

► **BODY ANIMAT3D: Concussions** 1238

► **SKILLS VIDEO: Controlling Bleeding** 1238

► **SKILLS VIDEO: Cleaning Minor Wounds** 1242

57.4 Common Disorders 1242

► **SKILLS VIDEO: Caring for a Patient Who Is Vomiting** 1245

57.5 Less Common Disorders 1245

► **SKILLS VIDEO: Performing Cardiopulmonary Resuscitation (CPR)** 1247

57.6 Common Psychosocial Emergencies 1249

57.7 The Patient Under Stress 1250

57.8 Educating the Patient 1250

57.9 Disasters and Pandemics 1250

57.10 Bioterrorism 1251

► **PROCEDURE 57-1: Stocking the Crash Cart** 1253

► **PROCEDURE 57-2: Performing an Emergency Assessment** 1254

► **PROCEDURE 57-3: Foreign Body Airway Obstruction in a Responsive Adult or Child** 1254

► **PROCEDURE 57-4: Foreign Body Airway Obstruction in a Responsive Infant** 1256

► **PROCEDURE 57-5: Controlling Bleeding** 1257

► **PROCEDURE 57-6: Cleaning Minor Wounds** 1258

► **PROCEDURE 57-7: Caring for a Patient Who Is Vomiting** 1258

► **PROCEDURE 57-8: Assisting During a Chemical Disaster** 1259

► **BODY ANIMAT3D: Burns** 1261

► **PRACTICE MEDICAL OFFICE: Clinical: Privacy and Liability** 1261

CHAPTER 58

Preparing for the World of Work 1262

58.1 Training in Action 1263

58.2 Obtaining Professional Certification 1267

58.3 Preparing to Find a Position 1268

58.4 Interviewing 1274

58.5 On the Job 1278

► **PROCEDURE 58-1: Résumé Writing** 1279

► **PRACTICE MEDICAL OFFICE: Admin: Check Out – Work Task Proficiencies** 1281

APPENDICES

I Prefixes, Suffixes, and Word Roots in Commonly Used Medical Terms A-1

II Abbreviations and Symbols Commonly Used in Medical Notations A-5

III Diseases and Disorders A-7

Glossary G-1

Index I-1

Procedures

- PROCEDURE 1-1** Obtaining Certification/Registration Information Through the Internet 9
- PROCEDURE 3-1** Self-Evaluation of Professional Behaviors 39
- PROCEDURE 4-1** Communicating with the Anxious Patient 57
- PROCEDURE 4-2** Communicating with the Angry Patient 58
- PROCEDURE 4-3** Communicating with the Assistance of an Interpreter 58
- PROCEDURE 5-1** Obtaining Signature for Receipt of Notice of Privacy Practices and Acknowledgment 88
- PROCEDURE 5-2** Completing a Privacy Violation Complaint Form 88
- PROCEDURE 5-3** Obtaining Authorization to Release Health Information 89
- PROCEDURE 6-1** Aseptic Handwashing 105
- PROCEDURE 6-2** Using an Alcohol-Based Hand Disinfectant 106
- PROCEDURE 6-3** Using a Biohazardous Sharps Container 106
- PROCEDURE 6-4** Disposing of Biohazardous Waste 106
- PROCEDURE 7-1** Handling a Fire Emergency 130
- PROCEDURE 7-2** Maintaining and Using an Eyewash Station 132
- PROCEDURE 7-3** Creating a Pediatric Reception Area 132
- PROCEDURE 7-4** Creating a Reception Area Accessible to Patients with Special Needs 133
- PROCEDURE 7-5** Opening and Closing the Medical Office 133
- PROCEDURE 8-1** Using a Facsimile (Fax) Machine 169
- PROCEDURE 8-2** Using a Photocopier Machine 169
- PROCEDURE 8-3** Using a Postage Meter 170
- PROCEDURE 8-4** Using a Check-Writing Machine 170
- PROCEDURE 8-5** Step-by-Step Overview of Inventory Procedures 171
- PROCEDURE 9-1** Performing Sanitization with an Ultrasonic Cleaner 186
- PROCEDURE 9-2** Guidelines for Disinfecting Exam Room Surfaces 186
- PROCEDURE 10-1** Creating a Professional Letter 213
- PROCEDURE 10-2** Writing an Interoffice Memo 214
- PROCEDURE 10-3** Composing a Professional E-mail Message 214
- PROCEDURE 10-4** Composing an Electronic Patient Letter 215
- PROCEDURE 10-5** Sorting and Opening Mail 215
- PROCEDURE 11-1** Preparing a New Patient Paper Medical Record 239
- PROCEDURE 11-2** Correcting Paper Medical Records 239
- PROCEDURE 11-3** Entering (Adding) Information into a Paper Medical Record 240
- PROCEDURE 12-1** Creating a New Patient Record Using EHR Software 254
- PROCEDURE 12-2** Making an Addition or Addendum (Correction) to an Electronic Health Record 254
- PROCEDURE 12-3** Creating an Appointment Matrix for an Electronic Scheduling System 255
- PROCEDURE 12-4** Scheduling a Patient Appointment Using an Electronic Scheduler 255
- PROCEDURE 13-1** Creating a Filing System for Paper Medical Records 271
- PROCEDURE 13-2** Setting Up an Office Tickler File 272
- PROCEDURE 13-3** Developing a Records Retention Program 272
- PROCEDURE 14-1** Using a Telecommunications Device for the Deaf (TDD) 293
- PROCEDURE 14-2** Renewing a Prescription by Telephone 293
- PROCEDURE 14-3** Screening and Routing Telephone Calls 294
- PROCEDURE 14-4** Handling Emergency Calls 295
- PROCEDURE 14-5** Retrieving Messages from an Answering Service or System 296
- PROCEDURE 15-1** Creating Electronic Patient Instructions 314
- PROCEDURE 15-2** Identifying Community Resources 314
- PROCEDURE 15-3** Locating Credible Patient Education Information on the Internet 315
- PROCEDURE 15-4** Developing a Patient Education Plan 316
- PROCEDURE 15-5** Outpatient Surgery Teaching 316
- PROCEDURE 16-1** Creating an Appointment Matrix 338
- PROCEDURE 16-2** Scheduling Appointments 339
- PROCEDURE 16-3** Completing the Patient Appointment Card 339
- PROCEDURE 16-4** Placing Appointment Confirmation Calls 340
- PROCEDURE 16-5** Scheduling Outpatient Surgical Appointments 340
- PROCEDURE 16-6** Scheduling Inpatient Surgical Appointments 341
- PROCEDURE 17-1** Verifying Workers' Compensation Coverage 376
- PROCEDURE 17-2** Submitting a Request for Prior Authorization 377
- PROCEDURE 17-3** Completing the CMS-1500 Claim Form 377
- PROCEDURE 17-4** Tracking Insurance Claims Submissions 379
- PROCEDURE 18-1** Locating an ICD-10-CM Code 403
- PROCEDURE 18-2** Locating a Health Status (Z) Code 403
- PROCEDURE 18-3** Locating an External Cause Code 404
- PROCEDURE 19-1** Locating a CPT Code 426
- PROCEDURE 19-2** Locating a HCPCS Code 426

PROCEDURE 19-3	Entering CPT/HCPCS and ICD Codes into an EHR Program	427
PROCEDURE 20-1	Posting Charges, Payments, and Adjustments	460
PROCEDURE 20-2	Using the Superbill as Bill/Receipt	461
PROCEDURE 20-3	Posting a Nonsufficient Funds (NSF) Check	461
PROCEDURE 20-4	Processing a Payment Resulting in a Credit Balance	462
PROCEDURE 20-5	Processing Refunds to Patients	462
PROCEDURE 20-6	Preparing an Age Analysis	462
PROCEDURE 20-7	Referring an Account to Collection Agency and Posting the Payment from the Agency	463
PROCEDURE 20-8	Completing a Truth in Lending Statement (Agreement)	464
PROCEDURE 20-9	Making a Bank Deposit	464
PROCEDURE 20-10	Reconciling the Bank Statement	465
PROCEDURE 20-11	Setting Up the Disbursements Journal	466
PROCEDURE 35-1	Removing Contaminated Gloves	707
PROCEDURE 35-2	Removing a Contaminated Gown	708
PROCEDURE 35-3	Wrapping and Labeling Instruments for Sterilization in the Autoclave	708
PROCEDURE 35-4	Running a Load Through the Autoclave	709
PROCEDURE 35-5	Notifying State and County Agencies About Reportable Diseases	710
PROCEDURE 36-1	Using Critical Thinking Skills During an Interview	733
PROCEDURE 36-2	Using a Progress Note	734
PROCEDURE 36-3	Obtaining a Medical History	734
PROCEDURE 37-1	Measuring and Recording Temperature	749
PROCEDURE 37-2	Measuring and Recording Pulse and Respirations	750
PROCEDURE 37-3	Taking the Blood Pressure of Adults and Older Children	751
PROCEDURE 37-4	Measuring Adults and Children	752
PROCEDURE 38-1	Positioning a Patient for an Exam	767
PROCEDURE 38-2	Communicating Effectively with Patients from Other Cultures and Meeting Their Needs for Privacy	768
PROCEDURE 38-3	Transferring a Patient in a Wheelchair for an Exam	769
PROCEDURE 38-4	Assisting with a General Physical Exam	770
PROCEDURE 39-1	Assisting with a Gynecological Exam	792
PROCEDURE 39-2	Assisting During the Exam of a Pregnant Patient	794
PROCEDURE 39-3	Assisting with a Cervical Biopsy	794
PROCEDURE 40-1	Measuring Infants	822
PROCEDURE 40-2	Maintaining Growth Charts	823
PROCEDURE 40-3	Collecting a Urine Specimen from a Pediatric Patient	825
PROCEDURE 41-1	Educating Adult Patients About Daily Water Requirements	841
PROCEDURE 42-1	Assisting with a Scratch Test Examination	862
PROCEDURE 42-2	Assisting with a Sigmoidoscopy	863
PROCEDURE 42-3	Assisting with a Needle Biopsy	864
PROCEDURE 43-1	Preparing the Ophthalmoscope for Use	883
PROCEDURE 43-2	Performing Vision Screening Tests	883
PROCEDURE 43-3	Administering Eye Medications	886
PROCEDURE 43-4	Performing Eye Irrigation	888
PROCEDURE 43-5	Measuring Auditory Acuity	889
PROCEDURE 43-6	Administering Eardrops	890
PROCEDURE 43-7	Performing Ear Irrigation	891
PROCEDURE 44-1	Creating a Sterile Field	913
PROCEDURE 44-2	Performing a Surgical Scrub	914
PROCEDURE 44-3	Donning Sterile Gloves	915
PROCEDURE 44-4	Assisting as a Floater (Unsterile Assistant) During Minor Surgical Procedures	916
PROCEDURE 44-5	Assisting as a Sterile Scrub Assistant During Minor Surgical Procedures	917
PROCEDURE 44-6	Assisting After Minor Surgical Procedures	917
PROCEDURE 44-7	Suture Removal	918
PROCEDURE 45-1	Using a Microscope	938
PROCEDURE 46-1	Obtaining a Throat Culture Specimen	966
PROCEDURE 46-2	Performing a Quick Strep A Test on a Throat Specimen	967
PROCEDURE 46-3	Preparing Microbiologic Specimens for Transport to an Outside Laboratory	967
PROCEDURE 46-4	Preparing a Microbiologic Specimen Smear	968
PROCEDURE 46-5	Performing a Gram Stain	968
PROCEDURE 47-1	Collecting a Clean-Catch Mid-Stream Urine Specimen	990
PROCEDURE 47-2	Collecting a 24-Hour Urine Specimen	991
PROCEDURE 47-3	Establishing Chain of Custody for a Urine Specimen	992
PROCEDURE 47-4	Measuring Specific Gravity with a Refractometer	993
PROCEDURE 47-5	Performing a Reagent Strip Test	993
PROCEDURE 47-6	Pregnancy Testing Using the EIA Method	994
PROCEDURE 47-7	Processing a Urine Specimen for Microscopic Examination of Sediment	995
PROCEDURE 47-8	Fecal Occult Blood Testing Using the Guaiac Testing Method	997
PROCEDURE 48-1	Quality Control Procedures for Blood Specimen Collection	1024
PROCEDURE 48-2	Performing Venipuncture Using an Evacuated System	1025
PROCEDURE 48-3	Performing Capillary Puncture	1027
PROCEDURE 48-4	Preparing a Blood Smear Slide	1029
PROCEDURE 48-5	Measuring Hematocrit Percentage After Centrifuge	1030
PROCEDURE 48-6	Measuring Blood Glucose Using a Handheld Glucometer	1032

PROCEDURE 48-7	Performing a Rapid Infectious Mononucleosis Test	1032	PROCEDURE 53-11	Administering a Vaginal Medication	1148
PROCEDURE 49-1	Obtaining an ECG	1056	PROCEDURE 53-12	Administering a Rectal Medication	1149
PROCEDURE 49-2	Holter Monitoring	1057	PROCEDURE 54-1	Administering Cryotherapy	1169
PROCEDURE 49-3	Measuring Forced Vital Capacity Using Spirometry	1059	PROCEDURE 54-2	Administering Thermotherapy	1170
PROCEDURE 49-4	Obtaining a Peak Expiratory Flow Rate	1060	PROCEDURE 54-3	Teaching a Patient How to Use a Cane	1171
PROCEDURE 49-5	Obtaining a Pulse Oximetry Reading	1061	PROCEDURE 54-4	Teaching a Patient How to Use a Walker	1172
PROCEDURE 50-1	Assisting with an X-ray Examination	1081	PROCEDURE 54-5	Teaching a Patient How to Use Crutches	1172
PROCEDURE 50-2	Documentation and Filing Techniques for X-rays	1081	PROCEDURE 55-1	Teaching Patients How to Read Food Labels	1198
PROCEDURE 51-1	Helping the Licensed Practitioner Comply with the Controlled Substances Act of 1970	1104	PROCEDURE 55-2	Alerting Patients with Food Allergies to the Dangers of Common Foods	1199
PROCEDURE 51-2	Interpreting a Prescription	1104	PROCEDURE 56-1	Preparing a Travel Expense Report	1225
PROCEDURE 53-1	Administering Oral Drugs	1139	PROCEDURE 56-2	Preparing an Agenda	1226
PROCEDURE 53-2	Administering Buccal or Sublingual Drugs	1141	PROCEDURE 56-3	Completing an Incident Report	1226
PROCEDURE 53-3	Drawing a Drug from an Ampule	1142	PROCEDURE 56-4	Generating Payroll	1227
PROCEDURE 53-4	Reconstituting and Drawing a Drug for Injection	1142	PROCEDURE 57-1	Stocking the Crash Cart	1253
PROCEDURE 53-5	Giving an Intradermal (ID) Injection	1143	PROCEDURE 57-2	Performing an Emergency Assessment	1254
PROCEDURE 53-6	Giving a Subcutaneous (Subcut) Injection	1144	PROCEDURE 57-3	Foreign Body Airway Obstruction in a Responsive Adult or Child	1254
PROCEDURE 53-7	Giving an Intramuscular (IM) Injection	1145	PROCEDURE 57-4	Foreign Body Airway Obstruction in a Responsive Infant	1256
PROCEDURE 53-8	Administering Inhalation Therapy	1146	PROCEDURE 57-5	Controlling Bleeding	1257
PROCEDURE 53-9	Administering and Removing a Transdermal Patch and Providing Patient Instruction	1147	PROCEDURE 57-6	Cleaning Minor Wounds	1258
PROCEDURE 53-10	Assisting with Administration of a Urethral Drug	1148	PROCEDURE 57-7	Caring for a Patient Who Is Vomiting	1258
			PROCEDURE 57-8	Assisting During a Chemical Disaster	1259
			PROCEDURE 58-1	Résumé Writing	1279

Giving an Intramuscular Injection	1132
Guidelines for Disinfecting Exam Room Surfaces	180
Holter Monitoring	1052
Initiating a Paper-Based Patient Medical Record	227
Interpreting a Prescription	1101
Locating an ICD-10-CM Code	403
Locating a CPT code	424
Manage a Prescription Refill	284, 1106
Measuring Adults and Children	748, 827
Measuring and Recording Pulse and Respirations	744
Measuring and Recording Temperature	742
Measuring Auditory Acuity	880
Measuring Blood Glucose Using a Handheld Glucometer	1022
Measuring Forced Vital Capacity Using Spirometry	1055
Measuring Hematocrit Percentage after Centrifuge	1020
Measuring Infants	814
Obtaining an ECG	1050
Obtaining a Medical History	730
Obtaining a Peak Expiratory Flow Rate	1056
Obtaining a Pulse Oximetry Reading	1056
Obtaining a Throat Culture Specimen	960
Obtaining Information from a Geriatric Patient	835
Obtaining Information from a Patient with a Hearing Aid	879
Performing an Emergency Assessment	1235
Performing a Reagent Strip Test	984
Performing a Surgical Scrub	907
Performing Cardiopulmonary Resuscitation (CPR)	1247
Performing Ear Irrigation	881
Performing Vision Screening Tests	874
Petty Cash	1208
PHI Authorization to Release Health Information	253
Preparing a Blood Smear Slide	1020
Positioning the Patient for an Exam	762
Posting Charges, Payments, and Adjustments	445
Pregnancy Testing Using the EIA Method	783, 986
Quality Control Procedures for Blood Specimen Collection	1002
Reconstituting and Drawing a Drug for Injection	1130
Registering a New Patient	222
Requesting Prior Authorization	362
Scheduling Inpatient Surgical Appointments	336
Scheduling Outpatient Surgical Appointments	335
Suture Removal	913
Taking the Blood Pressure of Adults and Older Children	747
Teaching a Patient How to Use Crutches	1167
Transferring a Patient in a Wheelchair for an Exam	762
Using a Microscope	926
Using Critical Thinking Skills During an Interview	720
Wrapping and Labeling Instruments for Sterilization in an Autoclave	703

A Closer Look

Today's medical assistants juggle many tasks in the medical office. McGraw-Hill is committed to helping prepare students to succeed in their educational program and to be successful in their chosen field. Most textbooks begin with a preface and a long list of features and supplements for both instructors and their students. While keeping with this tried-and-true format, it is our intention to give you a snapshot of some of the exciting solutions available with the sixth edition of *Medical Assisting: Administrative and Clinical Procedures with Anatomy and Physiology* for your Medical Assisting course. Instructors across the country have told us how much preparation it takes to teach medical assisting—they juggle as much, maybe more, than their students. To help, we have added more detailed information on how to organize and utilize the features as well as a breakdown of Learning Outcomes and activities that correspond in the Instructor Resources portion of Connect.

The Content—a Note from the Authors

The sixth edition of *Medical Assisting: Administrative and Clinical Procedures with Anatomy and Physiology* has many exciting and noteworthy updates. With insightful feedback from our users and reviewers, we set out to create a one-of-a-kind, dynamic, practical, realistic, and comprehensive set of tools for individuals preparing to become medical assistants.

When you begin the book, you will find it is not just about rote memorization of concepts. *Medical Assisting* immerses you in the world of BWW Associates Clinic, where you learn as you confront new workplace challenges in each chapter. All elements of the book—from the case studies in each chapter and the Soft Skills Success exercises to the Practice Fusion® EHR screenshots and other visuals—immerse the student in a realistic learning environment. Case studies are built around a set of patients who regularly visit BWW Associates Clinic, and you will get to know these patients as well as the employees of BWW Associates Clinic as you move through the chapters. You will also work with most of the patients of BWW Associates when using the Medical Assisting ACTIVSim™ 2.0 program.

Within this framework, we have strived to provide the most up-to-date information about all aspects of the medical assisting profession, with a focus on consistency, authenticity, and accuracy. Along with thousands of minor tweaks and updates, *Medical Assisting*, sixth edition, incorporates the following:

- Dozens of BWW EHR documentation/progress note examples in both clinical and administrative chapters

 **ACTIVSim**

- Soft Skills Success exercises, added to the Chapter Review, test employability skills and link students to related modules in Practice Medical Office, the simulation game.
- More than 25 EHR screenshots of Practice Fusion® software, showcasing basic EHR skills in the context of the BWW Medical Associates Clinic.
- Infection control is now covered in two separate, more comprehensive chapters, with basic infection control in Chapter 7 and advanced infection control practices in Chapter 35.
- Case studies enhanced by the inclusion of more detailed clinical information and by linking the case studies and new Soft Skills Success activities where applicable.
- Revised coverage of ICD coding to focus primarily on ICD-10-CM, including detailed 1500 claim form instructions utilizing the 5010 updates to make the form compliant with ICD-10 requirements.
- Content updates, including important topics such as EHR/practice management systems, Meaningful Use, the medical assistant as a patient navigator, Globally Harmonized System (GHS), assisting in a chemical disaster, OSHA-required training, healthcare-associated infections, and other infection control practices.

A more detailed list of chapter changes is covered in the next section.

Key Chapter-by-Chapter Changes

The following chapter-by-chapter list includes the essential changes and updates made to the book. A full list of changes is available in the transition guide provided in the Instructor Resources on Connect.

Chapter 1	The medical assistant as a patient navigator, scope of practice vs. standard of care		claim form updated to 5010 standards with new instructions
Chapter 2	Affordable Care Act and Patient Centered Medical Care Home	Chapter 18	Updated codes primarily to ICD-10-CM, added key terms combination codes and laterality
Chapter 3	Professional use of personal electronic devices and social media, customer service as professionalism	Chapter 19	Changed title to <i>Procedural Coding</i> , updated to 2015 codes throughout
Chapter 4	Difference between empathy and sympathy; introduced documentation and respecting culture differences	Chapter 20	Merged chapters 20 and 21, new title <i>Patient Collections and Financial Management</i> ; new sections, including In-Office Transactions, Payments After the Patient Visit, and Returned Checks, new terms added: <i>accounts receivable (A/R)</i> , <i>accounts payable (A/P)</i>
Chapter 5	Genetic Information Nondiscrimination Act; updated FDA regulatory functions, including the Comprehensive Drug Abuse Prevention and Control Act	Chapter 21	Previous edition Chapter 22; defined microvilli, added key terms word root, prefix, and suffix
Chapter 6	Changed title and content to <i>Infection Control Fundamentals</i> ; transmission-based precautions and OSHA education and training requirements for ambulatory care	Chapter 22	Previous edition Chapter 23; added acne to pathophysiology section, changed follicle description
Chapter 7	Changed title to <i>Safety and Patient Reception</i> ; medical office safety plan, Globally Harmonized System of Classification and Labeling Chemicals (GHS), and Safety Data Sheets (SDS)	Chapter 23	Previous edition Chapter 24; added new table The Spinal Column; defined ossification, joint junctions, and dislocation; added joint replacements and fractures to content
Chapter 8	Computer networks and encryption, monitoring of professional e-mails, computer security	Chapter 24	Previous edition Chapter 25; new figures of muscle types, botulism, and tetanus
Chapter 9	ADA Amendments Act of 2008, mixing 10% bleach solution	Chapter 25	Previous edition Chapter 26; new image of heart valves; added coronary circulation section
Chapter 10	Changed title to <i>Written and Electronic Communication</i> ; delivery notification, invoice vs. statement, using “rules” for e-mail management	Chapter 26	Previous edition Chapter 27; added key terms <i>hemoglobin (Hgb)</i> , <i>hematocrit (Hct)</i> , <i>albumins</i>
Chapter 11	Records release rules, changed the terminology from chart to health record	Chapter 27	Previous edition Chapter 28; new table to summarize lymphatic organs, new figure of thymus and spleen; key terms <i>lymph node</i> , <i>spleen</i> , <i>thymus</i> , and <i>tonsils</i> ; added celiac disease
Chapter 12	Meaningful Use, expanded coverage of shared data, general guidelines for using an EHR program, practice management systems	Chapter 28	Previous edition Chapter 29; added nasal conchae parts and purposes; added parts of the pharynx
Chapter 13	Previous edition Chapter 15; now includes Retaining Files in the Office section, updated content related to filing to reflect modern office standards	Chapter 29	Previous edition Chapter 30; new figures of Schwann cells, movement of nerve impulse, gray and white matter and central canals
Chapter 14	Previous edition Chapter 13; added automated voice response information, active listening, wireless headsets, electronic telephone messaging. Deleted information on patient courtesy phone	Chapter 30	Previous edition Chapter 31; new term <i>metabolic wastes</i>
Chapter 15	Previous edition Chapter 14; defined modeling vs. return demonstration; sample e-newsletter, patient information form, and physician information figures added	Chapter 31	Previous edition Chapter 32; APGAR information with new table
Chapter 16	Electronic scheduler, examples of wave scheduling and modified wave scheduling	Chapter 32	Previous edition Chapter 33; minor revisions to improve clarity
Chapter 17	Precertification, patient-centered medical homes (PCMH) concept, Medicare tax and salary requirement updates, Insurance 1500	Chapter 33	Previous edition Chapter 34; minor revisions to improve clarity
		Chapter 34	Previous edition Chapter 35; new figure of refractions, gustatory cortex
		Chapter 35	New chapter <i>Infection Control Practices</i> ; new content, including healthcare-associated infections, injection safety, respiratory hygiene/cough etiquette, infection control related to medical equipment, surgical site infections (SSIs), and CDC reporting requirements for infectious diseases

Chapter 36	Updated descriptions of mirroring, verbalizing, and restatement	Chapter 47	Added urine transfer straws and urine culture and sensitivity
Chapter 37	Clarified the role of pain assessment; updated image of radial pulse; key terms <i>hyperventilation</i> , <i>dyspnea</i> , and <i>rhonchi</i> added	Chapter 48	Reorganized information for clarity and added new learning outcome, new information about ESR, performing blood collection, added requisition form to chapter
Chapter 38	Improved figures of patient positions; added key term <i>body mechanics</i>	Chapter 49	Updated content and photos to include MUSE Cardiology Information system; new key terms <i>rhythm strip</i> , <i>artifact</i> , and <i>peak expiratory flow rate (PEFR)</i>
Chapter 39	Revised pelvic exam section; added better explanation of preeclampsia	Chapter 50	New image of stereotactic breast biopsy; added DXA section
Chapter 40	Added pediatric dietary guidelines table, PKU, <i>growth chart</i> as key term; new vaccine information and catch-up schedule, amblyopia added; added asthma to pathophysiology section	Chapter 51	Updated information on vaccines, recordkeeping, and Rx, new key terms <i>adverse effects</i> and <i>side effects</i>
Chapter 41	New figure of kyphosis; added osteomalacia and sleep apnea to Table 41-1; sleep disorder feature; added adaptations and assistive devices information	Chapter 52	Revised image of metric steps; updated images and revised the formula method explanation
Chapter 42	Added chondrosarcomas to Table 42-1; updated several images; added chemical and nuclear stress tests information	Chapter 53	New images of calibrated spoons and oral syringes; additional information about needle selection
Chapter 43	Revised types of vision test and included contrast sensitivity and functional acuity tests; new figure with anatomy of the ear; added Weber and Rhine hearing tests with images	Chapter 54	New images of crutch gates to improve understanding
Chapter 44	Added key term <i>abscess</i> ; added information about loading and unloading scalpel, suture materials, and transport bags	Chapter 55	New images of nutrients; added celiac and non-celiac gluten sensitivity, allergy treatments, preventing obesity
Chapter 45	Revised content about microscope, CLIA Certificate of Waiver, and calibration and control samples	Chapter 56	Replenishing petty cash; new key terms, including <i>FICA</i> , <i>gross earnings</i> , <i>utilization review</i> , <i>quality assurance</i> , <i>risk management</i> , <i>diversity</i>
Chapter 46	Revised content related to viruses and disease, replaced multiple images	Chapter 57	Multiple sections revised for improved understanding of content; added information about cystic duct blockage
		Chapter 58	Revised information on resume types to improve understanding

A Guided Tour

Learning Outcomes, Key Terms, and Textbook Organization

Every learning outcome in *Medical Assisting*, sixth edition, is aligned with a level I heading. McGraw-Hill has made it even easier for students and instructors to find, learn, and review critical information. The chapter organization of the sixth edition is organized to promote learning based on what a medical assistant does in practice. The chapters build on one another to ensure student understanding of the many tasks they will be expected to perform. The chapters can be easily grouped together to create larger topics or units for the students to learn. For ease of understanding, content can be organized as follows:

- Unit One Medical Assisting as a Career—Chapters 1 to 5
- Unit Two Safety and the Environment—Chapters 6 to 9
- Unit Three Communication—Chapters 10 to 14
- Unit Four Administrative Practices—Chapters 15 to 20
- Unit Five Applied Anatomy and Physiology—Chapters 21 to 34
- Unit Six Infection Control and Clinical Practices—Chapters 35 to 44
- Unit Seven Assisting with Diagnostics—Chapters 45 to 50
- Unit Eight Assisting in Therapeutics—Chapters 51 to 55
- Unit Nine Medical Assisting Practice—Chapters 56 to 58

Key terms are called out at the beginning of each chapter and are set in bold throughout the text to further promote the mastery of learning outcomes.

LEARNING OUTCOMES	KEY TERMS
After completing Chapter 11, you will be able to:	
11.1 Explain the importance of patient medical records.	audit
11.2 Identify the documents that constitute a patient medical record.	CHEDDAR
11.3 Compare SOMR, POMR, SOAP, and CHEDDAR medical record formats.	demographic
11.4 Recall the six Cs of charting, giving an example of each.	documentation
11.5 Describe the need for neatness, timeliness, accuracy, and professional tone in patient records.	noncompliant
11.6 Illustrate the correct procedure for correcting and updating a medical record.	objective
11.7 Describe the steps in responding to a written request for release of medical records.	patient record/chart
	problem-oriented medical record (POMR)
	review of systems
	sign
	Subjective, Objective, Assessment, Plan (SOAP)
	source-oriented medical record (SOMR)
	subjective
	symptom
	transcription

Content Correlations

Medical Assisting, sixth edition, also provides a correlation structure that will enhance its usefulness to both students and instructors. We have been careful to ensure that the text and supplements provide coverage of topics crucial to all of the following:

- CAAHEP (Commission on Accreditation of Allied Health Education Programs) Standards and Guidelines for Medical Assisting Education Programs

- ABHES (Accrediting Bureau of Health Education Schools) Competencies and Curriculum
- AAMA (American Association of Medical Assistants) CMA (Certified Medical Assistant) Occupational Analysis
- AMT (American Medical Technologists) RMA (Registered Medical Assistant) Task List
- AMT CMAS (Certified Medical Assistant Specialist) Competencies and Examination Specifications
- NHA (National Healthcareer Association) Certified Clinical Medical Assistant (CCMA)
- NHA (National Healthcareer Association) Certified Medical Administrative Assistant (CMAAA)
- CMA (AAMA) Certification Examination Content Outline
- NCCT (National Center for Competency Testing) NCMA (National Certified Medical Assistant) Detailed Test Plan
- CAHIIM (Commission on Accreditation for Health Informatics and Information Management Education)

Correlations to these are included with the instructor resources located on Connect (see later pages for information about Connect™). In addition, CAAHEP requires that all medical assistants be proficient in the 71 entry-level areas of competence when they begin medical assisting work. ABHES requires proficiency in the competencies and curriculum content at a minimum. The opening pages of each chapter provide a list of the areas of competence that are covered within the chapter.

MEDICAL ASSISTING COMPETENCIES	
CAAHEP	ABHES
V.P.1 Use feedback techniques to obtain patient information including: (a) reflection (b) restatement (c) clarification	3. Medical Terminology d. Define and use medical abbreviations when appropriate and acceptable
V.P.11 Report relevant information concisely and accurately	4. Medical Law and Ethics a. Follow documentation guidelines b. Institute federal and state guidelines when releasing medical records or information
VI.C.4 Define types of information contained in the patient's medical record	7. Records Management c. Comply with federal, state, and local laws relating to exchange of information and describe elements of meaningful use and reports generated
VI.C.5 Identify methods of organizing the patient's medical record based on: (a) problem-oriented medical record (POMR) (b) source-oriented medical record (SOMR)	8. Administrative Procedures a. Gather and process documents f. Display professionalism through written and verbal communications
VI.C.6 Identify equipment and supplies needed for medical records in order to: (a) Create	

You will also find that each procedure is correlated to the ABHES and CAAHEP competencies within the workbook on the procedure sheets. These sheets can be easily pulled out of the workbook and placed in the student file to document proficiency.

Chapter Features

Each chapter opens with material that includes the Case Study, the learning outcomes, a list of key terms, the ABHES and CAAHEP medical assisting competencies covered in the chapter, and an introduction. Since the learning outcomes represent each of the level I headings in the chapter, they serve as the chapter outline. Chapters are organized into topics that move from the general to the specific. Updated color photographs, anatomical and technical drawings, tables, charts, and text features help educate the student about various aspects of medical assisting. The text features include the following:

- **Case Studies** are provided at the beginning of all chapters. They represent situations similar to those that the medical assistant may encounter in daily practice. The case studies include pictures of each of the patients who come to BWV Associates for care. Students will work with these patients in the ACTIVSim 2.0 program. Students are encouraged to consider the case study as they read each chapter. Case Study Questions in the end-of-chapter review check students' understanding and application of chapter content.

CASE STUDY

Patient Name	DOB	Allergies
Mohammad Nassar	5/17/20XX	NKA
Attending	MRN	Other Information
Elizabeth H. Williams, MD	423-90-687	Patient recently became sexually active.

Mohammad Nassar is a 16-year-old male who is new to the practice and comes to the office today for his annual physical examination. He has a known past medical history of asthma, which has been relatively stable until recently. He states when he arrives that he has been experiencing an increasing need for his rescue inhaler in the last several days. His

mother has brought him to the appointment, but Mohammad has asked that she remain in the reception area during his appointment. She does give you a list of Mohammad's current asthma medications and the previously completed new patient documents.

Keep Mohammad (and his mother) in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

David Sacks/Getty Images

ACTIVSim

CASE STUDY CRITICAL THINKING

Recall Mohammad from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding his case.

1. As a new patient, which documents should be completed prior to Mohammad being seen by the physician? What documents should he have brought with him, if available?
2. Your office uses a SOAP format for medical records. After Dr. Williams completes her exam, explain where each of the new documents or pieces of information obtained during Mohammad's exam will be filed using the SOAP format.

David Sacks/Getty Images

- **Procedures** give step-by-step instructions on how to perform specific administrative or clinical tasks that a medical assistant will be required to perform. The procedures are referenced within the content when discussed. Each of the procedures is found at the end of the chapter. New figures are included with many of the procedures. In the workbook, the tearable procedure sheets that mirror the exact procedures in the book allow for easy practice and assessment. Critical procedures can also be studied in skills video exercises on Connect.

PROCEDURE 11-1 Preparing a New Patient Paper Medical Record

WORK // DOC

Procedure Goal: To assemble a new patient paper medical record

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: File folder, labels as appropriate (alphabet, numbers, dates, insurance, allergies, etc.), forms (patient registration, medical history, advance directives, physician progress notes, laboratory forms), and a hole punch

Method:

1. Carefully create a chart label according to practice policy. This label may include the patient's last name followed by the first name, or it may be a medical record number for those offices that utilize numeric or alphanumeric filing.
RATIONALE: The label must be correct to avoid filing errors.
2. Place the chart label on the right edge of the folder, extending the label the length of the tab on the folder.

3. Place the date label on the top edge of the folder, updating the date according to practice policy. (The date is usually updated annually, if the patient has come into the office within the last year.)

RATIONALE: This makes it easy to identify current patient records for retrieval and identify records for purging if the patient has not been seen for a specified amount of time (often, 3 years).

4. If alpha or numeric filing labels are utilized, place a patient name label on the chart according to practice policy.
5. Punch holes in the appropriate forms for placement within the patient's medical record.

RATIONALE: Consistency in document placement assures that items can be found quickly when required.

- **Points on Practice** feature boxes provide guidelines on keeping the medical office running smoothly and efficiently.
- **Educating the Patient** feature boxes focus on ways to instruct patients about caring for themselves outside the medical office.
- **Caution: Handle with Care** feature boxes cover the precautions to be taken in certain situations or when performing certain tasks.

CAUTION: HANDLE WITH CARE

Maintaining Standards of Cleanliness in the Reception Area

Cleanliness is (and should be) one of a medical office's hallmarks. Not only is cleanliness required in the examination and testing rooms, it is also expected in the patient reception area. A messy patient reception area reflects badly on the practice. Patients may think, "If they don't care about this, what else do they not care about?" Maintaining standards of cleanliness helps ensure that the reception area is presentable and inviting at all times.

As a medical assistant, you may be involved—along with the physician, office manager, and other staff members—in setting the office's cleanliness standards. Standards are general guidelines. In addition to setting standards, you will need to specify the tasks required to meet each standard. You also may want to create a checklist of the tasks required to meet all of these standards.

The following list outlines standards you may want to consider. Specific housekeeping tasks for meeting those standards are included in parentheses.

1. Keep everything in its place. (Complete a daily visual check for out-of-place items. Return all magazines to racks. Push chairs back into place.)
2. Dispose of all trash. (Empty trash cans. Pick up trash on the floor or on furniture.)
3. Prevent dust and dirt from accumulating on surfaces. (Wipe or dust furniture, lamps, and artificial plants. Polish doorknobs. Clean mirrors, wall hangings, and pictures.)

4. Spot-clean areas that become dirty. (Remove scuffmarks. Clean upholstery stains.)

5. Disinfect areas of the reception area if they have been exposed to body fluids. (Immediately clean and disinfect all soiled areas.)

6. Handle items with care. (Take precautions when carrying potentially messy or breakable items. Do not carry too much at once.)

After the standards have been established, type and post them in a prominent place for the office staff (but not the patients) to see. The cleaning activities checklist may be posted, but the person responsible for cleaning the office also should keep a copy. It is everyone's duty to keep the office looking clean and presentable.

A schedule of specific daily and weekly cleaning activities also should be posted. Less frequent housekeeping duties, like laundering drapes, shampooing the carpet, and cleaning windows and blinds, can be noted in a tickler file so that they will be performed on a regular basis.

It is always a good idea to have a second staff member responsible for periodically working with the medical assistant on housekeeping responsibilities. That person also may be responsible for handling cleaning duties when the medical assistant is away from the office.

- **Pathophysiology** is featured in each of the chapters on anatomy and physiology. These sections provide students with details of the most common diseases and disorders of each body system and include information on the causes, common signs and symptoms, treatment, and, where possible, the prevention of each disease.

PATHOPHYSIOLOGY

LO 23.31

Common Diseases and Disorders of the Skeletal System

Arthritis is a general term meaning "joint inflammation." Although there are more than 100 types of arthritis, we will discuss the two most common types: osteoarthritis and rheumatoid arthritis.

OSTEOARTHRITIS, also known as *degenerative joint disease (DJD)*, is the most common type of joint disorder, affecting nearly everyone to some degree by the age of 70. DJD primarily affects the weight-bearing joints of the hips and knees, and the cartilage between the bones and the bones themselves begin to break down.

Causes. Research points to inflammatory processes or metabolic disorders as the etiology of DJD.

Signs and Symptoms. These include joint stiffness, aching, and pain, especially with weather changes. There is often fluid around the joint and grating noises with joint movement.

Treatment. Anti-inflammatory drugs, including aspirin and nonsteroidal anti-inflammatory drugs (NSAIDs) like naproxen and Feldene[®], may be used. Intra-articular steroid injections

may be tried for severe cases. In some cases, a series of injections of hyaluronic acid—containing medications is used when other treatments do not work. These injections serve as joint fluid replacement. Some success has been found with transplanting harvested cartilage cells from the patient's healthy knee cartilage, which are then grown in the lab and reinserted into the patient's diseased joint. Surgical scraping of the joint may also be done to remove deteriorated bone fragments. As a last resort, joint replacement may be recommended.

Joint replacement prostheses can be metal, plastic, or a combination of both. The physician can surgically replace part of the joint (partial) or the entire joint (total). An example of a partial hip replacement is the Birmingham Hip Resurfacing prosthesis. In this procedure the head of the femur is replaced by an all-metal prosthesis (see Figure 23.14). One of the advantages of partial joint replacement is that it conserves more bone than conventional total joint replacement. Conserving bone is important if additional surgery is needed in the future. The surgeon will have more natural bone to work with if a revision or new prosthesis is required.

Each chapter closes with a summary of the Learning Outcomes. The summary is followed by an end-of-chapter review with questions related to the case study, as well as 10 multiple-choice exam-style questions.

SUMMARY OF LEARNING OUTCOMES	
LEARNING OUTCOMES	KEY POINTS
2.1 Discuss healthcare trends and their relationship to medical assistant practice.	Medical assistants typically work in ambulatory care settings using EHR. They can expect to work with many older patients and should practice and assist patients with preventive care.
2.2 Identify medical specialties and specialists certified by the American Board of Medical Specialties (ABMS).	The ABMS certifies 24 major medical specialties and subspecialties. Medical specialties range from cardiology to oncology. As new medical advances occur, a demand for more specialty areas may emerge.
2.3 Recognize the duties of various allied health professionals with whom medical assistants may work.	Medical assistants are members of a healthcare team. The healthcare team includes physicians, nurses, physical therapists, other allied health professionals, and patients. Understanding the duties of other healthcare professionals will assist you as a professional medical assistant. Even if you do not work with some of the team members directly, you may have to contact them through telephone, written, or electronic communication.
2.4 Compare specialty careers that a medical assistant may choose for advancement.	A variety of medical specialty careers are available for the practicing administrative or clinical medical assistant. These careers require additional training or education and/or other certifications.
2.5 Differentiate professional associations that relate to healthcare and explain their relationship to the medical assisting profession.	Being a member of a professional association is essential to medical assisting practice. Knowledge of other healthcare and medical organizations allows the practicing medical assistant to function successfully within his or her profession.

- **Medical Terminology** practice exercises have been added to all the anatomy and physiology chapters.

- **Soft Skills Success** practice scenarios emphasize employability skills and critical thinking in complex situations. These new exercise features are included in most non-A&P chapters and are correlated to Practice Medical Office where applicable.

SOFT SKILLS SUCCESS

A 35-year-old male patient is scheduled for a vasectomy tomorrow. It is within your scope of practice to provide preoperative instruction and you feel confident in performing this task. When you introduce yourself and explain what you are going to do, the first words out of the patient's mouth are "How do you know what this is all about? I am the one who is getting things cut!" How would you respond to this patient?

Practice

Go to PRACTICE MEDICAL OFFICE and complete the module Admin: Check Out - Interactions.

The book also includes a glossary and three appendices for use as reference tools. The glossary lists all the words presented as key terms in each chapter, along with a pronunciation guide and the definition of each term. The appendices present a list of common medical terminology, including prefixes, root words, and suffixes, as well as medical abbreviations and symbols. A Diseases and Disorders appendix provides a quick reference point for patient conditions that the student may encounter.

Digital Materials for *Medical Assisting*

For the sixth edition, we enhanced the integration between the textbook and our digital study materials and expanded our offerings to better cover all aspects of medical assisting. Links between the textbook and the key study resources are highlighted by eye-catching icons divided by resource type. Digital study resources with icons include ACTIVSim™ 2.0, BodyANIMAT3D, Practice Fusion® EHR exercises, skills videos, and Practice Medical Office.

These different types of icons are then used to call out specific activities and exercises by name. For example, above you can see an icon for Connect skills videos (the resource) about Establishing and Conducting Supply Inventory and Receiving Supplies (the exercise name).

McGraw-Hill Connect® Medical Assisting

A number of our key resources for *Medical Assisting*, 6e—including BodyANIMAT3D activities, skills video exercises, and Practice Fusion® electronic health records simulations—are part of our Connect offering for Medical Assisting.

Here is more on what you can expect to find in Connect for *Medical Assisting*, 6e specifically:

- Pre- and Post- Tests
- End-of-Chapter Exercises
- Interactive Exercises
- Administrative and Clinical Skills Video Exercises*
- BodyANIMAT3D Exercises*
- UPDATED! EHR Exercises *
 - Utilizing both video and images, students will practice proper usage of a simulated EHR environment using Practice Fusion, the #1 cloud-based electronic health record platform. www.practicefusion.com
- NEW! Forms Exercises*
 - Utilizing common forms from a medical office, students can practice entering in the proper information from scenarios using a driver's license, an insurance form, a patient registration form, or sometimes all three. Forms include Patient Medical History, Superbill, and CMS 1500.
- NEW! Coding Exercises*
 - Utilizing scenarios developed by the authors, students can practice identifying and inputting the proper ICD-10 codes.
- NEW! Medical Terminology Practice*
 - A refresher area for the body systems chapters with Word Part exercises on select terms as well as audio terms with associated spelling practice.
- A completely revised and updated Test Bank (also available through the Instructor Resources)

*in applicable chapters

As part of Connect for Medical Assisting, we also offer SmartBook's adaptive reading experience, which is powered by LearnSmart, the most widely used adaptive learning resource.

For more information on Connect—the teaching and learning platform used with all McGraw-Hill Education products—and SmartBook look for the section *Connect, Required=Results*.

Simulations and Games for Medical Assisting

We offer two separate medical assisting study products for purchase to supplement Connect—ACTIVSim and Practice Medical Office—both of which are fully incorporated into the *Medical Assisting*, 6e learning experience.

ACTIVSim 2.0 Medical Assisting Clinical Simulator is made up of two parts: 10 Patient Case Clinical Simulators and 15 Clinical Skills Simulators. The Patient Case Clinical Simulators introduce students to nonacute medical assisting patient case scenarios, procedure simulators and quick e-learning exercises. A large portion of core clinical competencies can be simulated on virtual patients, where the learner can interact with a patient and practice the different tasks that a medical assistant performs in physicians' offices. The focus of ACTIVSim is on vital signs and obtaining patient data, including a chart feature, so that the learner can document vital signs and make notes about observations that the medical assistant can brief the doctor about. For seamless training, these patients are also used in the textbook case studies. ACTIVSim gives extensive, individualized feedback, providing students with a realistic clinical experience.

For a demo of ACTIVSim, please go to www.mhhe.com/activsim, click on Courses in the top menu, then on Health Professions in the list provided, where you'll find Medical Assisting and the option to "Try a Patient Module." An instructor's manual for ACTIVSim, updated to the sixth edition, is available in your Instructor Resources on Connect.

In Practice Medical Office (PMO), the student takes on the role of a new Medical Assistant in a 3D, immersive game focused on teaching the six key skills important to working in a medical office—professionalism, soft skills, office procedures, application of medical knowledge, and application of privacy and liability regulation. Practice Medical Office features twelve engaging and challenging modules representing the functional areas of a medical practice: administrative check-in interactions, clinical interactions, and administrative check-out interactions. As the players progress through each module, they will be faced with realistic situations and learning events that will test their mastery of critical job readiness skills, in a fun, engaging learning experience. PMO is accessible through a widget in Connect for *Medical Assisting*, 6e.

For a demo of Practice Medical Office, please go to http://www.mhpractice.com/products/Practice_Medical_Office and click on "Play the Demo." An instructor's manual for PMO, correlated to ABHES and CAAHEP standards by learning event, is available in your Instructor Resources on Connect.

McGraw-Hill Connect® Learn Without Limits

Connect is a teaching and learning platform that is proven to deliver better results for students and instructors.

Connect empowers students by continually adapting to deliver precisely what they need, when they need it, and how they need it, so your class time is more engaging and effective.

Course outcomes improve with Connect.

Using **Connect** improves passing rates by **10.8%** and retention by **16.4%**.

88% of instructors who use **Connect** require it; instructor satisfaction **increases** by 38% when **Connect** is required.

Analytics

Connect Insight®

Connect Insight is Connect's new one-of-a-kind visual analytics dashboard—now available for both instructors and students—that provides at-a-glance information regarding student performance, which is immediately actionable. By presenting assignment, assessment, and topical performance results together with a time metric that is easily visible for aggregate or individual results, Connect Insight gives the user the ability to take a just-in-time approach to teaching and learning, which was never before available. Connect Insight presents data that empowers students and helps instructors improve class performance in a way that is efficient and effective.

Connect helps students achieve better grades

Students can view their results for any **Connect** course.

Mobile

Connect's new, intuitive mobile interface gives students and instructors flexible and convenient, anytime-anywhere access to all components of the Connect platform.

Adaptive

THE FIRST AND ONLY
ADAPTIVE READING
EXPERIENCE DESIGNED
TO TRANSFORM THE
WAY STUDENTS READ

More students earn **A's** and **B's** when they use McGraw-Hill Education **Adaptive** products.

SmartBook®

Proven to help students improve grades and study more efficiently, SmartBook contains the same content within the print book, but actively tailors that content to the needs of the individual. SmartBook's adaptive technology provides precise, personalized instruction on what the student should do next, guiding the student to master and remember key concepts, targeting gaps in knowledge and offering customized feedback, and driving the student toward comprehension and retention of the subject matter. Available on smartphones and tablets, SmartBook puts learning at the student's fingertips—anywhere, anytime.

Over **4 billion** questions have been answered, making McGraw-Hill Education products more intelligent, reliable, and precise.

STUDENTS WANT SMARTBOOK®

of students reported **SmartBook** to be a more effective way of reading material

of students want to use the Practice Quiz feature available within **SmartBook** to help them study

of students reported having reliable access to off-campus wifi

of students say they would purchase **SmartBook** over print alone

reported that **SmartBook** would impact their study skills in a positive way

Additional Supplementary Materials

Student Workbook for Use with Medical Assisting, 6e—in print and full color (ISBN: 0-07-75258-8)

The Student Workbook provides an opportunity for the student to review and practice the material and skills presented in the textbook. Divided into parts and presented by chapter, the first part provides the following:

- Vocabulary review exercises, which test knowledge of key terms in the chapter
- Content review exercises, which test the student's knowledge of key concepts in the chapter
- Critical thinking exercises, which test the student's understanding of key concepts in the chapter
- Application exercises, which include figures and practice forms and test mastery of specific skills
- Case studies, which apply the chapter material to real-life situations or problems

Each section, Clinical and/or Administrative, contains the appropriate procedures, presented in the order in which they are shown in the student textbook. These have been revised for ease of use and include correlations to the ABHES and CAAHEP competencies mastered with the successful completion of each procedure. Accompanying Work Product Documentation (work/doc) provides blank forms for many of the procedures that require a specific type of document to complete the procedure. These documentation forms are used when completing many of the application activities as well as procedure competencies. Over 100 procedures as well as multiple application activities in the workbook include correlated work docs.

Pocket Guide for Use with Medical Assisting, 6e (ISBN: 0-07-752585-X)

The Pocket Guide is a quick and handy reference to use while working as a medical assistant or during training. It includes critical procedure steps, bulleted lists, and brief information all medical assistants should know. Information is sorted by Administrative, Clinical, Laboratory, and General content.

Instructor Resources

Medical Assisting also comes with the instructor resources you've come to expect, all of which can be found through the Instructor Resources section in Connect.

- An **Instructor's Manual** that contains everything to organize your course, complete with lecture outlines (with PowerPoint slide references), discussion points, learning activities, and case studies. Also included are the answer keys to the book and workbook.
- **Correlation Guides** map the standards of many accreditation bureaus, including The Accrediting Bureau of Health Education Schools (ABHES) Medical Assisting competencies and curriculum; The Commission on Accreditation of Allied Health Education Programs (CAAHEP) Standards and Guidelines for Medical Assisting Education Programs competencies; American Association of Medical Assistants (AAMA) Occupational Analysis; The Association of Medical Technologists (AMT) Registered Medical Assistant (RMA) Certified Exam Topics; The National Healthcareer Association (NHA) Medical Assisting Duty/Task List; the Commission for Accreditation on Health Informatics and Information Management Education (CAHIIM); and The Secretary's Commission on Achieving Necessary Skills (SCANS) areas of competence, as well as others.
- **PowerPoint Presentations** have been fully updated to include the latest figures and content and to mirror the design of the book. Teaching notes offer suggestions—in addition to those in the Instructor's Manual—to keep your class running smoothly. We have also taken steps to make our PowerPoints more accessible, including adding alt tags for images and tables and ensuring that our slides are organized to be easily read by screen readers
- An **Asset Map** breaks down all of the resources available through the book and Connect by chapter and by learning outcome, to help you identify *what* you want to include in your course and *where* to find it.
- A **Testbank**, completely revised, with over 5,000 questions, complete with tags for learning outcomes; ABHES and CAAHEP; and Bloom's taxonomy and others to organize or modify questions to meet your course needs.
- A **Transition Guide** to help users of earlier editions make the leap to this new edition, with thorough details outlined by the authors about changes big and small.

Check out the instructor resources area on Connect for additional resources, including an image library, sample syllabi, printable procedure checklists and work documents, and more!

Acknowledgments

The task of putting together a textbook and all of its supplements, both written and digital, takes a vast amount of cumulative effort and coordination among multiple individuals and companies. To acknowledge each of them here individually would take far too long. However, we would like start by acknowledging McGraw-Hill and all of the individuals that are listed on page iv in the front of this book for their continued assistance, encouragement, and support. A special thanks for those who are so close to this edition, including Michelle, Chipper, April, Katie, Bill, Srdj, Lori, and Lorraine. Without McGraw-Hill and its valued employees, there would be no need for this acknowledgment to be written.

We would also like to distinguish some individuals who worked tirelessly and directly with us, ensuring a completely improved product: Jodie Bernard, for helping us continue the work of updating all of the figures for this edition, to keep them current, accurate, and visually appealing; Florida State University College of Medicine, Family Medicine Residency Program at Lee Memorial Health System in Fort Myers, Fort Myers Eye Associates, and Pima Heart of Arizona (specifically, David I. Lapan, MD, Claudia Rasnake, MD, and Sharlene Villanueva), for welcoming us into their institutions, allowing us to shoot more current procedural photos, and

assisting us along the way. Thanks also to Jody James for picking up the pieces on numerous aspects of the project. Her attention to detail and willingness to help with whatever we needed for this edition have provided us the ability to focus on updating and reorganizing the essential content to make the 6e the best edition ever. We humbly thank each and everyone involved with this *Medical Assisting*, sixth edition.

Leesa and Terri would like to give a special thanks to Kathy Booth. Without her tireless work, team spirit and dedication to this project we would not be able to “keep the balls in the air.” Her grasp of the big picture and her constant happy nature are an inspiration to us both. It is a pleasure and an honor to work with her.

Contributors and Reviewers

We, along with McGraw-Hill, would like to thank the reviewers and contributors for their assistance in developing content, offering suggestions, and shaping this revision. We appreciate you. Many of the additions, improvements, and changes are due directly to and because of their feedback. We appreciate their insight and commitment to helping us provide information that is relevant and valuable to medical assisting students.

Introduction to Medical Assisting

CASE STUDY

EMPLOYEE INFORMATION	Employee Name	Position	Credentials
	Sandro Peso	Student	In Training
	Supervisor	Date of Hire	Other Information
	Malik Katahri, CMM	10/11/20XX	Assigned to Dr. Paul F. Buckwalter

Sandro Peso is a 33-year-old father of four who lost his job at a local factory. He is a medical assistant-in-training and is currently working at BWV Associates. He will be working in the administrative, clinical, and laboratory sections of the office. He wants to decide which area he likes best and where he might like to work when he finishes his training. It will not be

long until he graduates and needs to take the test to become credentialed. He is nervous about the exam but really wants to do well to get the best job he can to help support his family.

Keep Mr. Peso in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

After completing Chapter 1, you will be able to:

- 1.1 Recognize the duties and responsibilities of a medical assistant.
- 1.2 Distinguish various organizations related to the medical assisting profession.
- 1.3 Explain the need for and importance of the medical assistant credentials.
- 1.4 Identify the training needed to become a professional medical assistant.
- 1.5 Discuss professional development as it relates to medical assisting education.

KEY TERMS

- | | |
|--|---|
| accreditation | continuing education |
| Accrediting Bureau of Health Education Schools (ABHES) | cross-training |
| American Association of Medical Assistants (AAMA) | Health Insurance Portability and Accountability Act (HIPAA) |
| American Medical Technologists (AMT) | licensed practitioner |
| certification | multiskilled healthcare professional (MSHP) |
| Certified Medical Assistant (CMA) | Occupational Safety and Health Administration (OSHA) |
| Clinical Laboratory Improvement Amendments of 1988 (CLIA '88) | patient navigator |
| Commission on Accreditation of Allied Health Education Programs (CAAHEP) | professional development |
| | Registered Medical Assistant (RMA) |
| | registration |
| | résumé |
| | scope of practice |
| | standard of care |

- V.C.12** Define patient navigator
- V.C.13** Describe the role of the medical assistant as a patient navigator
- X.C.1** Differentiate between the scope of practice and standards of care for medical assistants
- X.C.5** Discuss licensure and certification as they apply to healthcare providers
- X.P.1** Locate a state's legal scope of practice for medical assistants

1. General Orientation

- a. Describe the current employment outlook for the medical assistant
- c. Describe medical assistant credentialing requirements and the process to obtain the credential. Comprehend the importance of credentialing
- d. List the general responsibilities & skills of the medical assistant

4. Medical Law and Ethics

- f. Comply with federal, state, and local health laws and regulations as they relate to healthcare settings
 - (1) Define scope of practice for the medical assistant within the state that the medical assistant is employed
 - (2) Describe what procedures can and cannot be delegated to the medical assistant and by whom within various employment settings

11. Career Development

- b. Demonstrate professional behavior

► Introduction

Healthcare is changing at a rapid rate. Advanced technology, implementation of cost-effective medicine, and the aging population are all factors that have caused growth in the healthcare services industry. As the healthcare services industry expands, the US Department of Labor projects that medical assisting will grow 29% between 2012 and 2022, which is much faster than the average for all occupations. The growth in the number of physicians' group practices and other healthcare practices that use support personnel will in turn continue to drive up demand for medical assistants. Medical assisting is the perfect complement to the changing healthcare industry.

Medical assistants have the training to perform a variety of duties, which qualify them to fill many different job openings in the healthcare industry. This chapter provides an introduction to the medical assisting profession. It presents a general description of your future duties, credentials, and needed training. Some basic facts about professional associations, organizations, and development related to medical assisting are also discussed. All of this will help you begin your career as a medical assistant.

► Responsibilities of the Medical Assistant

LO 1.1

Your specific responsibilities as a medical assistant will depend on the type, location, and size of the facility, as well as its medical specialties. General tasks performed by most

medical assistants include working and communicating with patients throughout the healthcare experience. In fact, medical assistants often perform the role of **patient navigator**. They help patients find their way through the sometimes complex healthcare system, helping them overcome any barriers they may encounter to help ensure that they get the diagnosis and treatment they need in a timely manner.

Medical assistants work in an administrative, clinical, and/or laboratory capacity. As an administrative medical assistant, you may handle the payroll for the office staff (or supervise a payroll service), obtain equipment and supplies, and serve as the link between the physician or other **licensed practitioner** and representatives of pharmaceutical and medical supply companies. As a clinical medical assistant, you will be the physician's or other licensed practitioner's right arm by maintaining an efficient office, preparing and maintaining medical records, assisting the practitioner during examinations, and keeping examination rooms in order. Note that a licensed practitioner in healthcare means an individual other than a physician who is licensed or otherwise authorized by the state to provide healthcare services. Your laboratory duties as a medical assistant may include performing basic laboratory tests and maintaining laboratory equipment. In small practices, you may handle all duties. In larger practices, you may specialize in a particular duty. As you grow in your profession, advanced duties may be required. The lists of duties in Table 1-1 are provided to help you better understand what you will be doing when you practice as a medical assistant.

TABLE 1-1 Daily Duties of Medical Assistants

Duty Type	Entry-Level Duties	Advanced Duties
General  © ERproductions Ltd/Blend Images LLC RF	• Recognizing and responding effectively to verbal, nonverbal, and written communications • Explaining treatment procedures to patients • Providing patient education within scope of practice • Facilitating treatment for patients from diverse cultural backgrounds and for patients with hearing or vision impairments, or physical or mental disabilities • Acting as a patient navigator and advocate • Maintaining medical records	None
Administrative  © JGI/Daniel Grill/Blend Images/Getty Images RF	• Greeting patients • Handling correspondence • Scheduling appointments • Answering telephones • Creating and maintaining patient medical records • Handling billing, bookkeeping, and insurance processing • Performing medical transcription • Arranging for hospital admissions	• Developing and conducting public outreach programs to market the licensed practitioner's professional services • Negotiating leases of equipment and supply contracts • Negotiating nonrisk and risk managed care contracts • Managing business and professional insurance • Developing and maintaining fee schedules • Participating in practice analysis • Coordinating plans for practice enhancement, expansion, consolidation, and closure • Performing as a HIPAA compliance officer • Providing personnel supervision and employment practices • Providing information systems management
Clinical  © Anderson Ross/Photolibrary RF	• Assisting the licensed practitioner during examinations • Assisting with asepsis and infection control • Performing diagnostic tests, such as spirometry and ECGs • Giving injections, where allowed • Phlebotomy, including venipuncture and capillary puncture • Disposing of soiled or stained supplies • Performing first aid and cardiopulmonary resuscitation (CPR) • Preparing patients for examinations • Preparing and administering medications as directed by the licensed practitioner, and following state laws for invasive procedures • Recording vital signs and medical histories • Removing sutures or changing dressings on wounds • Sterilizing medical instruments • Instructing patients about medication and special diets, authorizing drug refills as directed by the licensed practitioner, and calling pharmacies to order prescriptions • Assisting with minor surgery • Teaching patients about special procedures before laboratory tests, surgery, X-rays, or ECGs	• Initiating an IV and administering IV medications with appropriate training, and as permitted by state law • Reporting diagnostic study results • Assisting patients in the completion of advance directives and living wills • Assisting with clinical trials
Laboratory  © Adam Gault/Getty Images RF	• Performing Clinical Laboratory Improvement Amendments (CLIA)–waived tests, such as a urine pregnancy test, on the premises • Collecting, preparing, and transmitting laboratory specimens • Teaching patients to collect specific specimens properly • Arranging laboratory services • Meeting safety standards (OSHA guidelines) and fire protection mandates	• Performing as an OSHA compliance officer • Performing moderately complex laboratory testing with appropriate training and certification

You may also choose to specialize in a specific area of healthcare. For example, podiatric medical assistants make castings of feet, expose and develop X-rays, and assist podiatrists in surgery. Ophthalmic medical assistants help ophthalmologists (doctors who provide eye care) by administering diagnostic tests, measuring and recording vision, testing the functioning of eyes and eye muscles, and performing other duties. A discussion of medical specialties is found in the chapter *Healthcare and the Healthcare Team*. For specific information about medical assistant duties within medical specialty practice, review the following chapters: *Assisting in Reproductive and Urinary Specialties*, *Assisting in Pediatrics*, *Assisting in Geriatrics*, *Assisting in Other Medical Specialties*, and *Assisting with Eye and Ear Care*.

► Medical Assisting Organizations LO 1.2

Many organizations guide the profession of medical assisting. These include professional associations such as the American Association of Medical Assistants (AAMA) and the American Medical Technologists (AMT), as well as accrediting and other organizations. As a future medical assistant, knowledge of these organizations will help you make critical decisions about your career.

Professional associations set high standards for quality and performance in a profession. They define the tasks and functions of an occupation, and they provide members with the opportunity to communicate and network with one another. Becoming a member of a professional association helps you achieve career goals and furthers the profession of medical assisting. Joining as a student is encouraged and some associations even offer discounted rates to students for a specified amount of time after graduation.

American Association of Medical Assistants

The idea for a national association of medical assistants—later to be called the **American Association of Medical Assistants (AAMA)**—was suggested at the 1955 annual state convention of the Kansas Medical Assistants Society. The next year, at an American Medical Association (AMA) meeting, the AAMA was officially created. In 1978, the US Department of Health, Education, and Welfare declared medical assisting as an allied health profession.

AAMA's Purpose The AAMA works to raise standards of medical assisting to a more professional level. It is the only professional association devoted exclusively to the medical assisting profession.

AAMA Occupational Analysis In 1996, the AAMA formed a committee whose goal was to revise and update its standards for the **accreditation** of programs that teach medical assisting. The committee's findings were published in 1997 as the "AAMA Role Delineation Study: Occupational Analysis of the Medical Assistant Profession." The study included a Role Delineation Chart that outlined the areas of competence to be mastered as an entry-level medical assistant. The Role Delineation Chart of the CMA (AAMA) was updated in 2003 to include additional

competencies. In 2009, and again in 2013, it was updated and named the Occupational Analysis of the CMA (AAMA).

The Occupational Analysis provides the basis for medical assisting education and evaluation. Mastery of the areas of competence listed in the Occupational Analysis is required for all students in accredited medical assisting programs. The Occupational Analysis includes three areas of competence: administrative, clinical, and general. Each of these three areas is divided into narrower areas, for a total of 10 specific areas of competence. Within each area, a bulleted list of statements describes the medical assistant's role.

According to the AAMA, the Occupational Analysis may be used to

- Describe the field of medical assisting to other healthcare professionals.
- Identify entry-level areas of competence for medical assistants.
- Help practitioners assess their own current competence in the field.
- Aid in the development of **continuing education** programs.
- Prepare appropriate types of materials for home study.

Professional Support for CMAs (AAMA) When you become a member of the AAMA, you will have a large support group of active medical assistants. Membership benefits include

- Professional publications, such as *CMA Today*.
- A large variety of educational opportunities, such as chapter-sponsored seminars and workshops about the latest administrative, clinical, and management topics.
- Group insurance.
- Legal information.
- Local, state, and national activities that include professional networking and multiple continuing education opportunities.
- Legislative monitoring to protect your right to practice as a medical assistant.
- Access to the website at <http://www.aama-ntl.org>.

American Medical Technologists (AMT)

American Medical Technologists (AMT) is a nonprofit certification agency and professional membership association representing over 45,000 individuals in allied healthcare. Established in 1939, AMT began a program to register medical assistants at accredited schools in the early 1970s. The AMT provides allied health professionals with professional certification services and membership programs to enhance their professional and personal growth. Upon certification, individuals automatically become members of AMT and start to receive benefits. You will read more about the benefits of joining a professional organization later in the chapter. The AMT provides many certifications, including the Registered Medical Assistant RMA (AMT) credential and the Certified Medical Assistant Specialist CMAS (AMT) credential.

Professional Support for RMAs (AMT) The AMT offers many benefits for RMAs (AMT). These include

- Professional publications.
- Membership in the AMT Institute for Education.
- Group insurance programs—liability, health, and life.
- State chapter activities.
- Legal representation in health legislative matters.
- Annual meetings and educational seminars.
- Student membership.
- Access to the website at <http://www.americanmedtech.org>.

Other Medical Assisting Organizations

In addition to the AAMA, which provides the CMA credential, and the AMT, which provides the RMA and CMAS credentials, many organizations provide certification testing and medical assisting credentials. Specific information about medical assisting credentials is discussed later in this chapter.

National Healthcareer Association (NHA) This organization was established in 1989 as an information resource and network for today's active healthcare professionals. NHA provides certification and continuing education services for healthcare professionals and curriculum development for educational institutions. It offers a variety of certification exams, including Billing and Coding Specialist (CBCS), Medical Administrative Assistant (CMAA), and Clinical Medical Assistant (CCMA). Some of the NHA's programs and services include

- Certification development and implementation.
- Continuing education curriculum development and implementation.
- Program development for unions, hospitals, and schools.
- Educational, career advancement, and networking services for members.
- Registry of certified professionals.

Healthcare educators working in their various fields of study develop the National Healthcare Association certification exams. The NHA is a member of the National Organization of Competency Assurance (NOCA).

National Center for Competency Testing (NCCT)

This is an independent agency that certifies the validity of competency and knowledge of the medical profession through examination. Medical assistants and medical office assistants receive the designation of National Certified Medical Assistant (NCMA) and National Certified Medical Office Assistant (NCMOA) after passing the certification examination. The NCCT avoids any allegiance to a specific organization or association.

The National Association for Health Professionals (NAHP)

NAHP (<http://www.nahpusa.com>) offers multiple credentials for healthcare professionals. The organization, which has been in existence for 30 years, prides itself

in making the process of obtaining a credential an accessible, affordable, and obtainable goal for individuals who wish to show commitment to their chosen profession. Having multiple credentials with one agency makes maintaining continuing education easier for practicing healthcare professionals. The NAHP offers many credentials, including the Medical Assistant, Phlebotomy Technician, EKG Technician, Coding Specialist, Administrative Health Assistant, Patient Care Technician, Dental Assistant, Pharmacy Technician, and Surgical Technician credentials.

With the growth of the medical assisting field, new organizations have developed to serve professionals. For example, the American Medical Certification Association (AMCA), founded in 2010, provides certification for clinical and/or administrative medical assistants. The American Registry of Medical Assistants (ARMA) is also one of many national certifying organizations, which certifies/registers medical assistants. Prospective medical assistants should be knowledgeable about the agency they will use to obtain their medical assisting credential.

Medical Assistant Credentials

LO 1.3

Certification is confirmation by an organization that an individual is qualified to perform a job to professional standards. **Registration**, on the other hand, does not guarantee an individual's competence. Instead, registration is the granting of a title or license by a board that gives permission to practice in a chosen profession. Once credentialed, you earn the right to wear a pin that is obtained through the credentialing organization (Figure 1-1).

Medical assisting credentials such as certification and registration are not always required to practice as a medical assistant. However, employers today are aggressively recruiting medical assistants who are credentialed in their field. Small physician practices are being consolidated or merged into larger providers of healthcare, such as hospitals, to decrease operating expenses. Human resource directors of these larger organizations place great importance on professional credentials for their employees.

FIGURE 1-1 Wearing one of these pins indicates you have obtained a credential in medical assisting. Medical assistants registered by the American Medical Technologists must pass the RMA exam to be certified and can wear the pin on the left. Members of the American Association of Medical Assistants who pass the CMA exam wear the pin on the right.

© Total Care Programming, Inc.

An accredited medical assisting program is competency based; this means that standards are set by an accrediting body for skill and proficiency in administrative and clinical tasks. Accrediting bodies are discussed later in this chapter. It is the educational institution's duty to ensure that medical assisting students learn all medical assisting competencies and that evidence is clearly documented for each student. Periodic evaluations are performed by the accrediting agencies to ensure the effectiveness of the program.

Competencies and proficiency assessments are parts of the CMA (AAMA) examination. For example, administering medications is a competency required of accredited medical assisting programs and is a component of the CMA (AAMA) examination. The CMA (AAMA) credential and the affiliation with a professional organization demonstrate competence and provide evidence of training. They also lessen the likelihood of a legal challenge to the quality of a medical assistant's work. Basically, there is less chance of malpractice if employees are credentialed through AAMA or AMT. School accreditation and credentials will be discussed in more detail later in this chapter.

State and Federal Regulations

Certain provisions of the **Occupational Safety and Health Administration (OSHA)** and the **Clinical Laboratory Improvement Amendments of 1988 (CLIA '88)** are making mandatory credentialing for medical assistants a logical step in the hiring process. OSHA and CLIA '88 regulate health-care but presently do not require that medical assistants be credentialed. However, various components of these statutes can be met by demonstrating that medical assistants are certified. For example, some physician offices perform moderately complex laboratory testing on-site. The medical assistant can perform moderately complex tests if she or he has the appropriate training and skills.

AAMA Credential

The **Certified Medical Assistant (CMA)** credential is awarded by the Certifying Board of the AAMA. The AAMA's certification examination evaluates mastery of medical assisting competencies based on the Occupational Analysis of the CMA (AAMA), which is available at <http://www.aama-ntl.org/resources/library/OA.pdf>. The National Board of Medical Examiners (NBME) also provides technical assistance in developing the tests.

CMAs (AAMA) must recertify the credential every 5 years. To be recertified as a CMA (AAMA), 60 contact hours must be accumulated during the 5-year period: 10 in the administrative area, 10 in the clinical area, and 10 in the general area, with 30 additional hours in any of the three categories. In addition, 30 of these contact hours must be from an approved AAMA program. The AAMA also requires you to hold a current CPR card.

The recertification mandate requires you to learn about new medical developments through education courses or participation in an examination. Hundreds of continuing education courses are sponsored by local, state, and national AAMA groups. The AAMA also offers self-study courses through its continuing education department.

Only students who have completed medical assisting programs accredited by CAAHEP and ABHES are eligible to take the certification examination. The AAMA offers the Candidate's Guide to the Certification Examination to help applicants prepare for the examination. This guide explains the test format and test-taking strategies. It also includes a sample examination with answers and information about study references. Some schools have also incorporated test preparation reviews into their programs.

The CMA (AAMA) examination is a computerized test that may be taken any time at a designated testing site in your area. You may search the Internet for an application and test review materials. Once you have successfully passed the CMA (AAMA) examination, you have earned the right to add that credential to your name, such as Miguel A. Perez, CMA (AAMA).

AMT Credentials

The American Medical Technologists (AMT) organization credentials medical assistants as **Registered Medical Assistants (RMA)** or **Certified Medical Assistant Specialists (CMAS)**. Although this section focuses on the RMA credential, you can find more about the CMAS credential on the AMT website at <http://www.amt1.org>.

Requirements for the RMA (AMT) credential include

- Graduation from a medical assistant program that is accredited by ABHES or CAAHEP, or is accredited by a regional accrediting commission, by a national accrediting organization approved by the US Department of Education, or by a formal medical services training program of the US Armed Forces.
- Alternatively, employment in the medical assisting profession for a minimum of 5 years, no more than 2 years of which may have been as an instructor in the postsecondary medical assistant program.
- Passing the AMT examination for RMA (AMT) certification.

RMAs (AMT) must accumulate 30 contact hours for continuing education units (CEUs) every 3 years if they were certified after 2006. RMAs (AMT) who were certified before this date are expected to keep abreast of all the changes and practices in their field through educational programs, workshops, or seminars. However, there are no specific continuing education requirements. Once a medical assistant has passed the AMT exam, she has earned the right to add RMA (AMT) to her name: Kaylyn R. Haddix, RMA (AMT).

The RMA (AMT) and CMA (AAMA) Examinations

The RMA (AMT) and CMA (AAMA) qualifying examinations are rigorous. Participation in an accredited program will help you learn what you need to know. The examinations cover several distinct areas of knowledge, including

- General medical knowledge, including terminology, anatomy, physiology, behavioral science, medical law, and ethics.

- Administrative knowledge, including medical records management, collections, insurance processing, and the **Health Insurance Portability and Accountability Act (HIPAA)**. HIPAA is a set of government regulations that help ensure continuity and privacy of healthcare, among other things.
- Clinical knowledge, including examination room techniques, medication preparation and administration, pharmacology, and specimen collection.

Each certification examination is based on a specific content outline created by the certifying organization. You should research the Internet to gain additional information regarding any of these certifications. See Procedure 1-1, Obtaining Certification/Registration Information Through the Internet.

▶ Training Programs

LO 1.4

With continuous changes in healthcare today, the role of the medical assistant has become dynamic and wide ranging. These changes have expanded the expectations for medical assistants. The knowledge base of the modern medical assistant includes

- Administrative and clinical skills.
- Patient insurance product knowledge (specific to the workers' geographic locations).
- Compliance with healthcare-regulating organizations.
- Exceptional customer service.
- Practice management.
- Current patient treatments and education.

The medical assisting profession requires a commitment to self-directed, lifelong learning. Healthcare is changing rapidly because of new technology, new healthcare delivery systems, and new approaches to facilitating cost-efficient, high-quality healthcare. A medical assistant who can adapt to change and is continually learning will be in high demand.

Formal programs in medical assisting are offered in a variety of educational settings, including vocational-technical high schools, postsecondary vocational schools, community and junior colleges, and 4-year colleges and universities. Vocational school programs usually last 9 months to 1 year and award a certificate or diploma. Community and junior college programs are usually 2-year associate's degree programs. Training can be obtained through traditional classroom as well as online settings.

Program Accreditation

Accreditation is the process by which programs are officially authorized. The US Department of Education recognizes two national entities that accredit medical assisting educational programs:

- **Commission on Accreditation of Allied Health Education Programs (CAAHEP)**. CAAHEP works directly with the Medical Assisting Educational Review Board (MAERB) of Medical Assistants Endowments to ensure that all accredited schools provide a competency-based education. CAAHEP accredits medical assisting programs in both

public and private postsecondary institutions throughout the United States that prepare individuals for entry into the medical assisting profession.

- **Accrediting Bureau of Health Education Schools (ABHES)**. ABHES accredits private postsecondary institutions and programs that prepare individuals for entry into the medical assisting profession.

Accredited programs must cover the following topics:

- Anatomy and physiology
- Medical terminology
- Medical law and ethics
- Psychology
- Oral and written communications
- Laboratory procedures
- Clinical and administrative procedures

High school students may prepare for these courses by studying mathematics, health, biology, office skills, book-keeping, and information technology. You may obtain current information about accreditation standards for medical assisting programs from the AAMA.

Medical assisting programs must also include a practicum (externship) or work experience. This applied training is for a specified length of time in an ambulatory care setting, such as a physician's office, hospital, or other healthcare facility. Additionally, the AAMA lists its minimum standards for accredited programs. This list of standards ensures that all personnel—administrators and faculty alike—are qualified to perform their jobs. These standards also ensure that financial and physical resources are available at accredited programs.

Graduation from an accredited program helps your career in three ways. First, it shows that you have completed a program that meets nationally accepted standards. Second, it provides recognition of your education by professional peers. Third, it makes you eligible for registration or certification. Students who graduate from an ABHES- or CAAHEP-accredited medical assisting program are eligible to take the CMA (AAMA) or RMA (AMT) immediately.

Work Experience

Your practicum (externship) or work experience is mandatory in accredited schools. The length of your experience will vary, depending on your particular program, so familiarize yourself with the program requirements as soon as possible. Since this is a required part of the program, no matter how good your grades are in class, if the work experience is not completed, you will not graduate from the program.

Your practicum (externship) or work experience is an extension of your classroom learning experience. You will apply skills learned in the classroom in an actual medical office or other healthcare facility. You also earn the right to include this applied training experience on your résumé under job experience, as long as you title it as "Medical Assistant Practicum, Externship, or Work Experience." The *Preparing for the World of Work* chapter will further explain your practical work experience.

► Professional Development

LO 1.5

Professional development refers to skills and knowledge attained for both personal development and career advancement. During your training, you should strive to improve your knowledge and skills. This will help you transition into your first job with ease. You can also gain valuable knowledge and skills through volunteering prior to or in addition to work experience obtained as a student.

Once you have entered the world of work as a medical assistant, you will want to continue to develop in your profession. You can do this through additional training, **cross-training**, and other forms of continuing education.

Volunteer Programs

Volunteering is a rewarding experience. Before you even begin a medical assisting program, you can gain experience in a healthcare profession through volunteer work. As a volunteer, you will get hands-on training and learn what it is like to assist patients who are ill, disabled, or frightened.

You may volunteer as an aide in a hospital, clinic, nursing home, or doctor's office, or as a typist or filing clerk in a medical office or medical record room. Some visiting nurse associations and hospices (home-like medical settings that provide medical care and emotional support to terminally ill patients and their families) also offer volunteer opportunities. These experiences may help you decide if you want to pursue a career as a medical assistant.

The American Red Cross also offers volunteer opportunities for student medical assistants. The Red Cross needs volunteers for its disaster relief programs locally, statewide, nationally, and abroad. As part of a disaster relief team at the site of a hurricane, tornado, storm, flood, earthquake, or fire, volunteers learn first-aid and emergency triage skills. Red Cross volunteers gain valuable work experience that may help them obtain a job.

Because volunteers are not paid, it is usually easy to find work opportunities. Just because you are not paid for volunteer work, however, does not mean the experience is not useful for meeting your career goals.

Include information about any volunteer work on your **résumé**—a document that summarizes your employment and educational history. Be sure to note specific duties, responsibilities, and skills you developed during the volunteer experience. Refer to the *Preparing for the World of Work* chapter for examples of résumés.

Multiskilled Healthcare Professionals

Many hospitals and healthcare practices are embracing the idea of a **multiskilled healthcare professional (MSHP)**. An MSHP is a cross-trained team member who is able to handle many different duties.

Reducing Healthcare Costs By hiring multiskilled healthcare professionals, healthcare organizations can reduce personnel costs. MSHPs can perform the functions of two or more people, so they are cost-effective employees and are in high demand.

Expanding Your Career Opportunities Career opportunities are vast if you are self-motivated and willing to learn new skills. Following are some examples of positions for medical assistants with additional experience and certifications:

- Medical office manager
- Medical biller and coder
- Medical assisting instructor (with a specified amount of experience and education)
- ECG technician
- Sterilization technician
- Patient care technician

If you are multiskilled, you will have an advantage when job hunting. Employers are eager to hire multiskilled medical assistants and may even create positions for them.

You can gain multiskill training by showing initiative and a willingness to learn every aspect of the medical facility in which you are working. When you begin working in a medical facility, establish goals regarding your career path and discuss them with your immediate supervisor. Indicate to your supervisor that you would like cross-training in every aspect of the medical facility. Begin in the department in which you are currently working and branch out to other departments once you master the skills needed for your current position. This will demonstrate a commitment to your profession and a strong work ethic. Cross-training is a valuable marketing tool to include on your résumé.

Scope of Practice

Professional development includes knowing your **scope of practice** and working within it. Medical assistants are not “licensed” healthcare professionals and most often work under a licensed healthcare provider, such as a nurse practitioner or physician. Licensed healthcare professionals may delegate certain duties to a medical assistant, providing he or she has had the appropriate training through an accredited medical assisting program or through on-the-job training provided by the medical facility or physician.

Questions often arise regarding the kinds of duties a medical assistant can perform. There is no universal answer to these questions. There is no single national definition of a medical assistant's scope of practice, so the medical assistant must research the state in which he or she works to learn about the scope of practice. You can find this information online by entering “medical assistant scope of practice” and the name of your state in any major search engine. In general, a medical assistant may not perform procedures for which he or she was not educated or trained. Examples of procedures medical assistants may not perform include administering intravenous medications (without advanced training), diagnosing patients or informing patients of a diagnosis, and giving any advice to a patient unless permitted by a facility's standard policies and procedures. The AAMA and AMT are good resources to assist you in your research. The AAMA Occupational Analysis is also a helpful reference source that identifies the procedures that medical assistants are educated to perform.

Do not confuse the terms *scope of practice* and *standard of care*. A medical assistant's scope of practice is the set of procedures that can be performed and the actions that can be taken under the terms of his or her professional license and training. **Standard of care** is a legal term that refers to the care that would ordinarily be provided by an average, prudent healthcare provider in a given situation.

Networking

Networking is building alliances—socially and professionally. It starts long before your job search. By attending professional association meetings, conferences, or other functions, medical assistants generate opportunities for employment and personal and professional growth. Networking, through continuing education conferences throughout your career, keeps the doors open to employment advancement.

PROCEDURE 1-1 Obtaining Certification/Registration Information Through the Internet

Procedure Goal: To obtain information from the Internet regarding professional credentialing

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Computer with Internet access and printer

Method:

1. Open your Internet browser and use a search engine to search for the credential you would like to pursue—for example, Certified Medical Assistant or Registered Medical Assistant. If you are unsure of the credential you would like to pursue, you may just want to search for “Medical Assisting Credentials.”
2. Select the site for the credential you are pursuing. Avoid sponsored links. These links are paid for and typically will not take you to the site of a credentialing organization.
3. To navigate to the home page:
 - For the CMA (AAMA) credential, enter the site <http://www.aama-ntl.org>.

- For the RMA (AMT) or CMAS (AMT) credential, enter the site <http://www.americanmedtech.org>.

4. Determine the steps you must take to obtain the selected credential.
 - For CMA (AAMA), go to the drop-down menu “CMA (AAMA) Exam” and select the link “About the Exam.”
 - For RMA (AMT), go to the drop-down menu “Get Certified” and select the link “Eligibility.”

5. Print or write down the qualifications you must obtain.
RATIONALE: *Maintaining a record of needed qualifications will be a reference as you pursue your chosen credential.*
6. Once you have met the qualifications, you will need to apply for the examination or certification. Download the application and the application instructions for the RMA (AMT) or the CMAS (AMT) or the candidate application and handbook for the CMA (AAMA).
7. To view or print these instructions, you may need to download Adobe Reader. You can click on a link to download Adobe Reader after you click on the “Apply Online” link for AMT or “Apply for the Exam” for AAMA.
8. Before or after you apply for the examination, you will need to prepare for the examination. Select the link “Study for the Exam” on the AAMA site or the “Prepare for Exam” link under the “Get Certified” drop-down menu on the AMT site.
9. Prepare for the exam by reviewing the content outline, obtaining additional study resources, or taking a practice exam online.
10. Print or save downloaded information in a file folder on your desktop labeled “Credentials” or another name you can recognize. To print, click the printer icon found at the bottom of the web page or click the printer icon in your browser.
11. Return to the appropriate site if you have additional questions. For the CMA (AAMA) site, you may want to check the “FAQs on CMA (AAMA) Certification” link. On the AMT site for RMA or CMAS, find the link “Take the Exam” and download the FAQs regarding the testing process.
12. Any questions you have that are not addressed on the sites can be e-mailed to the organizations. For RMA, send an e-mail to mail@americanmedtech.org. On the AAMA site for the CMA credential, click the “Contact” link on the top right-hand side of the screen and follow the instructions to send an e-mail.

S U M M A R Y O F L E A R N I N G O U T C O M E S

LEARNING OUTCOMES	KEY POINTS
1.1 Recognize the duties and responsibilities of a medical assistant.	Medical assistants may have administrative, clinical, and/or laboratory duties and responsibilities. Duties range from entry-level to advanced and are listed in Table 1-1.
1.2 Distinguish various organizations related to the medical assisting profession.	Many organizations provide certification and support to the medical assisting profession. The AAMA and AMT are highly recognized professional associations that can help you progress in your medical assisting career.
1.3 Explain the need for and importance of the medical assistant credentials.	Certification and registration provide recognition of your education by peers and for advancement in your career. Medical assistants with a credential can expect more and better employment opportunities.
1.4 Identify the training needed to become a professional medical assistant.	Professional training for medical assistants includes formal training in a variety of educational settings. Training at a program accredited by CAAHEP or ABHES requires you to obtain work experience as part of your education.
1.5 Discuss professional development as it relates to medical assisting education.	<i>Professional development</i> refers to skills and knowledge attained for both personal development and career advancement. Continuing education, cross-training, and additional training help you develop within your profession. Medical assistants who network, work within their scope of practice, and are more multiskilled are highly marketable.

C A S E S T U D Y C R I T I C A L T H I N K I N G

Recall Sandro Peso from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding his situation.

1. Describe for Sandro the skills he may perform in each of the three areas (administrative, clinical, and laboratory) of medical assisting at BWW Associates office.

- 2.** Why should Sandro obtain a credential and membership to a professional organization?
- 3.** How can Sandro find out what to expect on his certification test?
- 4.** What suggestions would you give Sandro to assist him in obtaining the best job?
- 5.** To whom will Sandro be accountable during his work at BWW Associates?

E X A M P R E P A R A T I O N Q U E S T I O N S

- 1.** (LO 1.3) Two accrediting bodies for medical assisting training programs are
 - a. ABHES and OSHA
 - b. OSHA and AAMA
 - c. ABHES and CAAHEP
 - d. CAAHEP and CLIA
 - e. CAAHEP and NHA
- 2.** (LO 1.1) Entry-level administrative duties for a medical assistant include
 - a. Educating patients, drawing blood, and negotiating leases
 - b. Taking vital signs, performing phlebotomy, and calling in prescriptions
 - c. Creating and maintaining patient medical records and billing and coding
 - d. Performing ECGs, infection control, and billing and coding
 - e. Checking vital signs, performing phlebotomy, and creating and maintaining patient medical records

3. (LO 1.2) The main purpose of the American Association of Medical Assistants (AAMA) is to
 - a. Raise the standards of professionalism
 - b. Assist with malpractice lawsuits
 - c. Provide externships
 - d. Support continuing education for CMAs (AAMA) and RMAs (AMT)
 - e. Provide accreditation for medical assisting programs
4. (LO 1.2) You want to obtain an RMA credential. Which organization do you need to contact?
 - a. NHA
 - b. AAMA
 - c. CAAHEP
 - d. ABHES
 - e. AMT
5. (LO 1.5) Which of the following is the best description of networking?
 - a. Building alliances that generate opportunities
 - b. Practical work experience during training
 - c. Official authorization of medical assisting educational programs
 - d. Training in every aspect of the medical facility
 - e. Using the Internet
6. (LO 1.5) Which of the following is the *best* reason for you to become multiskilled?
 - a. Reduction of healthcare costs
 - b. Learning of new skills
 - c. Increased employment opportunities
 - d. Ability to work two jobs
 - e. Recertification
7. (LO 1.2) You have become a member of the AAMA. Which of the following is most likely one of your benefits?
 - a. Medical transcription
 - b. Accreditation
 - c. Cross-training
 - d. Increased wages
 - e. Group insurance
8. (LO 1.1) Which of the following would you be expected to do as an entry-level clinical medical assistant?
 - a. Develop public outreach programs
 - b. Be a HIPAA compliance officer
 - c. Arrange laboratory services
 - d. Arrange outpatient diagnostic tests
 - e. Sterilize medical instruments
9. (LO 1.3) Which of the following is *least* likely the reason for the increased need to obtain a medical assisting credential?
 - a. OSHA regulations
 - b. An increase in malpractice
 - c. An increase in organizations that require certification
 - d. CLIA regulations
 - e. An increase in multiskilled employees
10. (LO 1.2) Which of the following does *not* provide a certification examination for the medical assisting profession?
 - a. NAHP
 - b. AMT
 - c. AMA
 - d. NCCT
 - e. NHA

Healthcare and the Healthcare Team

2

CASE STUDY

EMPLOYEE INFORMATION	Employee Name	Position	Credentials
	Miguel A. Perez	Administrative Assistant	CMA (AAMA)
	Supervisor	Date of Hire	Other Information
	Malik Katahri, CMM	6/21/20XX	Wants to further his education

Miguel A. Perez, CMA (AAMA), is the administrative assistant at BWW Associates. He came in early to get caught up on some important duties. He needs to schedule consults for Raja Lautu and Ken Washington, call in a medication refill for Sylvia Gonzales, and verify insurance coverage for Cindy Chen. Just as he is getting started, Kaylyn Haddix, RMA

© Karen Moskowitz/Getty Images

(AMT), calls from one of the exam rooms and tells him to call 911 because a patient has just gone into cardiac arrest. So much for coming in early; looks like it is going to be a busy day.

Keep Miguel in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

LEARNING OUTCOMES

After completing Chapter 2, you will be able to:

- 2.1 Discuss healthcare trends and their relationship to medical assistant practice.
- 2.2 Identify medical specialties and specialists certified by the American Board of Medical Specialties (ABMS).
- 2.3 Recognize the duties of various allied health professionals with whom medical assistants may work.
- 2.4 Compare specialty careers that a medical assistant may choose for advancement.
- 2.5 Differentiate professional associations that relate to healthcare and explain their relationship to the medical assisting profession.

KEY TERMS

anaphylactic shock	osteopathic manipulative medicine (OMM)
autopsy	preventive care
biopsy	primary care physician (PCP)
board-certified physician	triage
electronic health records (EHR)	wellness
hormone	whole foods
meridians	

- V.P.3** Use medical terminology correctly and pronounced accurately to communicate information to providers and patients
- X.C.2** Compare and contrast provider and medical assistant roles in terms of standard of care

- 1. General Orientation**
- b. Compare and contrast the allied health professions and understand their relation to medical assisting
 - d. List the general responsibilities of the medical assistant
- 3. Medical Terminology**
- c. Apply various medical terms for each specialty
- 11. Career Development**
- b. Demonstrate professional behavior

► Introduction

Medical assistants are an integral part of a healthcare delivery team. As such, you should recognize healthcare trends and facilities as well as the different physician specialists, allied health professionals, specialty medical assistant careers, and healthcare organizations. Medical assistants work in various roles and must be in contact with multiple other healthcare team members on an ongoing basis. For example, medical assistants are asked to call and process insurance referrals to different specialties and diagnostic departments, or they may need to contact the pharmacy to renew a prescription. A working knowledge of the different specialties and allied health professions demonstrates professionalism and competence, and it assists in developing a spirit of cooperation. Recognizing the functions of specialty careers and healthcare associations will help you perform your duties, as well as provide for advancement.

► Healthcare Trends

LO 2.1

Knowledge of current healthcare trends and healthcare practice settings will assist you in determining your future role as a medical assistant. Consider the following healthcare trends and how they may affect your career.

Technology

Over the last decade, the advancement of technology has affected all aspects of our life, including healthcare. Healthcare has always been affected by science and technology. For example, during the 1970s, mobile telephones seemed to be just the imaginings of science fiction. Today, a medical assistant can carry a smartphone in a pocket for easy reference and for professional communication with patients and members of the healthcare team.

Paper charts have become a thing of the past. By 2014, all healthcare facilities were required to convert to the use of **electronic health records (EHR)** in order to continue being

reimbursed for Medicare and Medicaid claims (Figure 2-1). EHR allow all of a patient's data to be accessible from one location. An electronic chart provides quick access and helps prevent mistakes with medication and other medical errors. The *Electronic Health Records* chapter will provide details about how to use this essential tool.

Preventive Care and Wellness

The terms *preventive care* and *wellness* can bring to mind anything from massage therapy to *whole foods*. **Whole foods** are those that have little or no processing before they are eaten. The idea of **wellness** includes fitness. The link among exercise, diet, and good health is strong. Screening tests and drugs to prevent disease are common in **preventive care**. A healthy lifestyle goes a long way toward improving your quality of life. Physicians, insurance companies, fitness experts, and aging baby boomers all recognize the value of good health. As a medical assistant, maintaining your own health as well as guiding patients to better health practices is a must.

Aging Population

After World War II, the US economy boomed. There were plenty of jobs and people could afford to have large families. This resulted in a phenomenon known as the baby boom, which occurred from 1946 to 1964. Many of these babies are now at retirement age. In 2011, the first boomers began to receive Medicare, our national health insurance for the elderly. Because older adults require more healthcare services, medical assistants will most likely work with these patients.

Healthcare Facilities

Medical assistants may work in all types of healthcare facilities, including physicians' offices, clinics, urgent care centers, and the ambulatory or outpatient care facilities at hospitals. Two other types of healthcare facilities that commonly employ medical assistants are long-term care and hospice care. Long-term care centers provide care to people who need

FIGURE 2-1 All healthcare employees, including medical assistants, must be able to use electronic health records.
© Practice Fusion®

nursing or other professional healthcare services on a regular basis. These patients may not need round-the-clock nursing services, but it may be unsafe for them to live alone or they may have needs their family cannot meet. Many residents in long-term care facilities are frail or elderly. They also may be disabled. Hospice is usually offered only to patients who are thought to have fewer than 6 months to live. An example of a hospice patient is a person who has terminal cancer (Figure 2-2). Anyone who has a terminal condition is eligible for this type of care.

The Affordable Care Act was passed in 2010 in an effort to lower healthcare costs and improve the quality of healthcare in the United States. With this legislation has come the creation of Patient Centered Medical Homes (PCMH), which are a potential solution to the problem of providing higher-quality care to a larger population. PCMH are meant to transform how primary care is organized and delivered and have the following functions.

- **Comprehensive care.** A team of care providers, including medical assistants, provides for physical and mental healthcare needs, including prevention and wellness, acute care, and chronic care. Virtual teams may also be used.
- **Patient-centered care.** Patients are encouraged to manage and organize their own care and are considered core members of the care team.

FIGURE 2-2 Hospice care provides for the needs of patients who are dying, including the need for touch.

© Royalty-Free/Corbis

- **Coordinated care.** Care is coordinated across healthcare services. Communication among patients, families, the PCMH, and other members of the care team is required.
- **Accessible services.** For all patients, it is essential to ensure shorter waiting times for urgent needs, enhanced in-person hours, around-the-clock telephone or electronic access to a member of the care team, and alternative methods of communication such as e-mail and telephone care.

- Quality and safety. Key parts of the PCMH are using evidence-based medicine and clinical decision-support tools to guide shared decision making with patients and families, engaging in performance measurement and improvement, measuring and responding to patient experiences and patient satisfaction, and practicing population health management.

With the development of PCMH, the medical assistant can expect new and expanded roles.

► Medical Specialties

LO 2.2

The American Board of Medical Specialties (ABMS) recognizes 24 specialties and subspecialties. The purpose of ABMS is to certify physicians in various specialties and to support their professional development. ABMS consists of 24 individual boards, one for each specialty or subspecialty. Each board is approved by both the ABMS and the American Medical Association Council on Medical Education (AMA/CME). In addition to certifying physicians, these boards develop professional and educational standards in the specialty areas.

Within each medical specialty are several subspecialties. For example, cardiology is a major specialty; pediatric cardiology is a subspecialty. As advances in the diagnosis and treatment of diseases and disorders unfold, the demand for specialized care increases and more medical specialties emerge. The education and licensing process for **board-certified physicians** is long—from 9 to 12 years—and requires multiple board tests. A medical assistant may be the “right arm” to any physician, including those described here.

Family Practice

Family practitioners (sometimes called general practitioners) are medical doctors (MDs) or doctors of osteopathy (DOs) who are generalists and treat all types of illnesses and ages of patients. Family practitioners are called **primary care physicians (PCPs)** by insurance companies. The term refers to individual doctors who oversee patients’ long-term health-care. Some people, however, have an internist or OB/GYN as their primary care physician.

A family practitioner sends a patient to a specialist when the patient has a specific condition or disease that requires advanced care. For example, a family practitioner refers a patient with a lump in her breast to an oncologist, a specialist who treats tumors, or to a general surgeon. The specialist or surgeon then does a needle biopsy of the lump to determine if it is malignant.

Working in a general practice, you will encounter patients with many different conditions and illnesses. If you work for a general practitioner, you will often be responsible for arranging patient appointments with specialists. It is therefore important for you to be familiar with the duties of each medical specialist.

Allergy

Allergists diagnose and treat physical reactions to substances such as mold, dust, fur, and pollen. An individual with allergies may also be hypersensitive to substances such as drugs, chemicals, or other elements in nature. An allergic reaction may be minor, such as a rash; serious, such as asthma; or

life-threatening, such as **anaphylactic shock**, which causes swelling of the airways or nasal passages.

Anesthesiology

Anesthesiologists and anesthesiologists use medications that cause patients to lose sensation, or feeling, during surgery. These healthcare practitioners administer anesthetics before, during, and sometimes after surgery. They also educate patients regarding the anesthetic that will be used and its possible postoperative effects. An anesthesiologist is an MD or a DO. A certified registered nurse anesthetist (CRNA) is a registered nurse who has completed an additional program of study recognized by the American Association of Nurse Anesthetists.

Bariatrics

Bariatrics is the specialty of medicine that deals with the medical and surgical treatment of obesity. Bariatric surgery may be recommended for extremely obese patients who suffer impaired health as a result of their weight. Prior to undergoing any type of bariatric surgery, candidates must first undergo counseling and other treatment options for weight management. Therapy before and after bariatric surgery is necessary for successful weight loss and improved health.

Cardiology

Cardiologists diagnose and treat cardiovascular diseases (diseases of the heart and blood vessels). Cardiologists also read electrocardiograms (ECGs, which are sometimes referred to as EKGs) for hospital cardiology departments. They educate patients about the positive role a healthy diet and regular exercise play in preventing and controlling heart disease and recommend cardiovascular rehabilitation when needed (Figure 2-3).

FIGURE 2-3 A cardiologist may order an exercise stress test that monitors the patient’s heart while he is exercising.

© Digital Vision/Punchstock RF

Dermatology

Dermatologists diagnose and treat diseases of the skin, hair, and nails. Their patients have conditions ranging from warts and acne to skin cancer. Dermatologists treat boils, skin injuries, and infections. They also remove growths such as moles, cysts, and birthmarks; treat scars; and perform hair transplants.

Osteopathy

Doctors of osteopathy, who hold the title DO, practice a “whole-person” approach to healthcare. DOs believe that patients are more than just a sum of their body parts, and they treat the patient as a whole person instead of concentrating on specific symptoms. One key concept of osteopathy is that structure influences function. If a problem exists in one part of the body, it may affect function both in that area and in other areas.

DOs focus on the body’s ability to heal itself, and they actively engage patients in the healing process. They also use **osteopathic manipulative medicine (OMM)**, a system of hands-on techniques that help relieve pain, restore motion, and support the body’s natural functions. By using OMM techniques such as muscle energy and counterstrain techniques, DOs help improve function and restore health.

Emergency Medicine

Physicians who specialize in emergency medicine work in hospital emergency rooms and outpatient emergency care centers. They diagnose and treat patients with conditions resulting from an unexpected medical crisis or accident. Common emergencies include trauma, such as gunshot wounds or serious injuries from car accidents; other injuries, such as severe cuts; and sudden illness, such as a heart attack, a stroke, or food poisoning. Emergency medicine practitioners stabilize their patients so they can then be managed by their PCP or an appropriate specialist.

Endocrinology

Endocrinologists diagnose and treat disorders of the endocrine system. The endocrine system includes glands and organs in the body that secrete hormones. **Hormones** are chemicals that regulate body functions, including growth, metabolism, and reproduction. An example of a disorder treated by an endocrinologist is hypothyroidism, in which a patient has a lower-than-normal amount of thyroid hormone. This common disorder can cause a variety of symptoms including fatigue, weight gain, dry skin, and constipation.

Gastroenterology

Gastroenterologists diagnose and treat disorders of the gastrointestinal tract. These disorders include problems related to the functioning of the stomach, intestines, and associated organs. Examples include ulcers, irritable bowel syndrome (IBS), and gastroesophageal reflux disease (GERD).

Gerontology

Gerontologists study the aging process. Geriatrics is the branch of medicine that deals with the diagnosis and treatment

of problems and diseases of the older adult. A specialist in geriatrics may also be called a geriatrician. As the population of older adults increases, there is a greater need for licensed practitioners who specialize in diagnosing and treating diseases of older patients.

Gynecology

Gynecology is the branch of medicine concerned with diseases and conditions of the female genital tract, such as yeast infections, menstrual irregularities, and sexually transmitted infections (STIs). Gynecologists perform routine physical care and examination of the female reproductive system. Many gynecologists are also obstetricians.

Internal Medicine

Internists, or doctors of internal medicine, specialize in diagnosing and treating problems related to the internal organs. Some internists work with diseases and conditions related to all of the internal organs. Others choose to receive additional training that enables them to focus on 1 of 13 subspecialties. These subspecialties are adolescent medicine, allergy and immunology, cardiology, endocrinology, gastroenterology, geriatrics, hematology, infectious disease, nephrology, oncology, pulmonology, rheumatology, and sports medicine. Internists must be certified as specialists to practice in any of these areas.

Nephrology

Nephrologists study, diagnose, and manage diseases of the kidney. They may work in either a clinic or hospital setting. A medical assistant working with a nephrologist may assist in the operation of a dialysis unit for the treatment of patients with kidney failure, known as end-stage renal disease (ESRD). In a rural setting, a medical assistant might help a doctor operate a mobile dialysis unit that can be taken to the patient’s home or to a medical practice that does not have this technology.

Neurology

Neurology is the branch of medical science that deals with the nervous system. Neurologists diagnose and treat disorders and diseases of the nervous system, such as strokes. The nervous system is made up of the brain, the spinal cord, and nerves that receive, interpret, and transmit messages throughout the body.

Nuclear Medicine

Nuclear medicine is a fast-growing specialty related to radiology. Nuclear medicine and radiology use radiation to diagnose and treat disease, but radiology beams radiation through the body from an outside source, whereas nuclear medicine introduces a small amount of a radioactive substance into the body and forms an image by detecting radiation as it leaves the body. The radiation that patients are exposed to is comparable to that of a diagnostic X-ray. Radiology reveals interior anatomy, whereas nuclear medicine reveals organ function and structure. Noninvasive, painless nuclear medicine procedures

FIGURE 2-4 Obstetricians who are part of a private practice are usually connected with a specific hospital where they help their patients through labor and delivery.

© Don Thompson/Getty Images

are used to identify heart disease, assess organ function, and diagnose and treat cancer.

Obstetrics

Obstetrics involves the study of pregnancy, labor, delivery, and the period following labor, called postpartum (Figure 2-4). This field is often combined with gynecology. A physician who practices both specialties is referred to as an obstetrician/gynecologist, or OB/GYN.

Oncology

Oncologists determine whether tumors are benign or malignant and treat patients who have cancer. Treatment may involve chemotherapy, which is the administration of drugs to destroy cancer cells. Treatment may also involve radiation therapy, which kills cancer cells through the use of X-rays. Newer therapies include immune therapy, also called immunotherapy, and transplant techniques to urge the body to create healthy tissues to replace those affected by cancer. Oncologists treat both adults and children.

Ophthalmology

An ophthalmologist is an MD who diagnoses and treats diseases and disorders of the eye. This physician specialist examines patients' eyes for poor vision or disease. Other responsibilities include prescribing corrective lenses or medication, performing surgery, and providing follow-up care after surgery. The specialty of ophthalmology includes two other types of practitioners who are not MDs: optometrists and opticians. An optometrist obtains the credential

of OD (optometric doctor) and specializes in diagnosing and treating visual defects with glasses and contacts. An optician is a specialist who fills the prescriptions for glasses and contact lenses that are written by ophthalmologists and optometrists.

Orthopedics

Orthopedics is a branch of medicine that specializes in maintaining the function of the musculoskeletal system and its associated structures. An orthopedist diagnoses and treats diseases and disorders of the muscles and bones. Some orthopedists, called sports medicine specialists, concentrate on treating sports-related injuries, either exclusively for professional athletes or for nonprofessionals of all ages.

Otorhinolaryngology

Otorhinolaryngology is the study of the ear, nose, and throat. An otorhinolaryngologist diagnoses and treats diseases of these body structures. This physician specialist is also referred to as an ear, nose, and throat (ENT) specialist or otolaryngologist.

Pathology

Pathology is the study of disease. It provides the scientific foundation for all medical practice. The pathologist studies the changes a disease produces in the cells, fluids, tissues, and processes of the entire body. These samples often come from **biopsies** (samplings of cells that could be malignant or cancerous), cultures, and tissue samples. Some pathologists also perform **autopsies**, examinations of the bodies of the deceased, to determine the cause of a patient's death and to advance the clinical practice of medicine.

There are two basic types of pathologists: forensic pathologists and anatomic pathologists. Governments and police departments use forensic pathologists to determine facts about unexplained or violent crimes or deaths. Anatomic pathologists often work at hospitals in a research capacity, and they may read biopsies.

Pediatrics and Adolescent Medicine

Pediatrics is concerned with the development and care of children and adolescents from birth until 18 (in some practices, up to 21) years. A pediatrician diagnoses and treats childhood diseases and teaches parents skills to keep their children healthy.

Physical Medicine

Physical medicine specialists (physiatrists) are physicians who specialize in physical medicine and rehabilitation. They are certified by the American Board of Physical Medicine and Rehabilitation to diagnose and treat diseases and disorders such as sore shoulders and spinal cord injuries. Physiatrists offer an aggressive, nonsurgical approach to pain and injury for both adults and children.

Podiatry

Podiatry is practiced by a licensed doctor of podiatric medicine (DPM). A podiatrist studies and treats the foot and ankle. Podiatrists may diagnose, treat, prescribe medication, and perform surgery for disorders of the foot and, in some states, the ankle and leg.

Plastic Surgery

A plastic surgeon reconstructs, corrects, or improves body structures. Patients may be accident victims or disfigured due to disease or abnormal development. Plastic surgery includes facial reconstruction, facelifts, and skin grafting. Plastic surgery is also used to repair problems such as cleft lip and cleft palate, as well as disfigurement and restrictive scarring due to trauma.

Proctology

Proctology is the branch of medicine that diagnoses and treats disorders of the anus, rectum, and intestines. Proctologists treat conditions such as colitis, hemorrhoids, fistulas, tumors, and ulcers.

Radiology

Radiology is the branch of medical science that uses X-rays and radioactive substances to diagnose and treat disease. Radiologists specialize in reading X-rays. X-rays are used mostly for diagnosis—for example, to determine whether bones are broken or whether a patient has pneumonia. Radiologists often work with oncologists to apply radioactive substances to help kill cancer cells and reduce the size of malignant tumors.

Sports Medicine

Sports medicine is an interdisciplinary subspecialty of medicine that deals with the treatment and preventive care of amateur and professional athletes. Sports medicine teams consist of specialty physicians and surgeons, athletic trainers, and physical therapists. Sports medicine involves more than just treating injuries to the musculoskeletal system. Sports medicine can include an array of services, such as prevention and nutritional health.

Surgery

Surgeons use their hands and medical instruments to diagnose and correct deformities and treat external and internal injuries or disease (Figure 2-5). They work with many different specialists to surgically treat a broad range of disorders. General surgeons may, for example, perform operations as diverse as breast lumpectomy and pacemaker repair. Many surgeons specialize in a specific type of surgery, such as neurosurgery, vascular surgery, or orthopedic surgery.

Urology

A urologist diagnoses and treats diseases of the kidney, bladder, and urinary system. A urologist's patients include infants, children, and adults of all ages. Urologists also treat male reproductive diseases.

FIGURE 2-5 Most surgeons specialize in a particular type of surgery, such as heart surgery or eye surgery.

▶ Working with Other Healthcare Professionals

LO 2.3

A medical assistant is a member of a healthcare team. Working as a team member is discussed in the chapter *Professionalism and Success*. That healthcare team includes doctors, nurses, specialists, and the patients themselves. Your contact with other members of the team will occur in person, electronically, or by telephone. You should recognize and understand the duties of other allied health professionals in order to be effective in your role as a medical assistant. The following is an introduction to some common allied health professionals.

Acupuncturist

Acupuncturists treat people who have pain or discomfort by inserting thin, hollow needles under the skin. The points used for insertion are selected to balance the flow of qi (pronounced chee), or life energy, in the body. The theory of acupuncture relates to traditional Chinese beliefs about how the body works. Qi is composed of two opposite forces called yin and yang. If the flow of qi is unbalanced, insufficient, or interrupted, then emotional, spiritual, mental, and physical problems will result. The acupuncturist works to balance these two forces in perfect harmony. Although there are variations in types of acupuncture—Chinese, Korean, and Japanese—all practitioners focus on many pulse points along different **meridians**, the channels through which qi flows (Figure 2-6).

Chiropractor

Chiropractors treat people using manual treatments, although they also may employ physical therapy treatments, exercise programs, nutritional advice, and lifestyle modification to help correct problems causing the pain. The manual treatments, called adjustments, realign the vertebrae in the spine and restore the function of spinal nerves. Chiropractors use diagnostic testing such as X-rays, muscle testing, and posture

FIGURE 2-6 Meridians are pathways for the flow of qi in the body. Meridians are treated as part of traditional Chinese medicine to restore the body's harmony and wellness.

analysis to determine the location of spinal misalignments, also called subluxations. Using their findings, they develop a treatment plan, which may require several adjustments per week for several weeks or months.

Electroencephalographic Technologist

Electroencephalography (EEG) is the study and recording of the electrical activity of the brain. It is used to diagnose diseases and irregularities of the brain. The EEG technologist attaches electrodes to the patient's scalp and connects them to a recording instrument. The machine then provides a written record of the electrical activity of the patient's brain. EEG technologists work in hospital EEG laboratories, clinics, and physicians' offices.

Massage Therapist

Massage is one of the oldest methods of promoting healing. Massage therapists use pressure, kneading, stroking, vibration, and tapping to promote muscle and full-body relaxation, as well as to increase circulation and lymph flow (Figure 2-7). Increasing circulation helps remove blood and waste products from injured tissues and brings fresh blood and nutrients to the areas to speed healing. Massage is used to treat strains, bruises, muscle soreness or tightness, lower back pain, and dislocations. It also can relieve muscle spasms, restore motion and function to a body part, and decrease edema.

Medical Technology

Medical technology is an umbrella term referring to the development and design of clinical laboratory tests (such as diagnostic tests), procedures, and equipment. Two types of allied

FIGURE 2-7 Massage uses kneading, pressure, stroking, and human touch to alleviate pain and promote healing through relaxation.

© McGraw-Hill Education. Shaana Pritchard, photographer

health professionals who work in medical technology are medical technologists and medical laboratory scientists.

Medical technologists (MTs) have a 4-year bachelor's degree and use complex laboratory equipment to perform clinical tests. They may be assisted by medical laboratory technicians (MLTs), who have 2-year degrees and may perform more basic tests under the supervision of an MT. MLTs and MTs perform tests in the areas of hematology, serology, blood banking, urinalysis, microbiology, and clinical chemistry.

Medical laboratory scientists examine specimens of human body tissues and fluids, analyze blood factors, and culture bacteria to identify disease-causing organisms. They also supervise and train technicians and laboratory aides. Medical laboratory scientists have 4-year degrees and may specialize in areas such as blood banking, microbiology, and chemistry.

Nuclear Medicine Technologist

A nuclear medicine technologist performs tests to oversee quality control, to prepare and administer radioactive drugs, and to operate radiation detection instruments (Figure 2-8). This allied health professional is also responsible for correctly positioning the patient, performing imaging procedures, and preparing the information for use by a physician.

Occupational Therapist

An occupational therapist works with patients who have reduced physical or mental function due to physical injuries or illnesses, psychological or developmental problems, or problems associated with the aging process. This health professional helps patients attain maximum physical and mental health by using educational, vocational, and rehabilitation therapies and activities. The occupational therapist may work in a hospital, a clinic, an extended-care facility, a rehabilitation hospital, or a government or community agency.

FIGURE 2-8 A nuclear medicine technologist positions the patient, performs imaging procedures, and prepares the information for use by a physician.

© Javier Larrea/age fotostock RF

Pharmacist

Pharmacists are professionals who have studied the science of drugs and who dispense medication and health supplies to the public. Pharmacists know the chemical and physical qualities of drugs and are knowledgeable about the companies that manufacture drugs.

Pharmacists inform the public about the effects of prescription and nonprescription (over-the-counter) medications. Pharmacists are employed in hospitals, clinics, and nursing homes. They also may work for government agencies, pharmaceutical companies, privately owned pharmacies, or chain store pharmacies. Some pharmacists own their own stores. Pharmacists must have 5 to 7 years of education, be registered by the state, and pass a state board examination.

Physical Therapist

A physical therapist (PT) plans and uses physical therapy programs for medically referred patients. The PT helps these patients restore function, relieve pain, and prevent disability following disease, injury, or loss of body parts. A physical therapist uses various treatment methods, which include therapy with electricity, heat, cold, ultrasound, massage, and exercise. The physical therapist also helps patients accept their disabilities.

Radiologic Technology

A radiographer (X-ray technician) assists a radiologist in taking X-ray films, which are used to diagnose broken bones, tumors, ulcers, and disease. A radiographer usually works in the radiology department of a hospital but may also use mobile X-ray equipment in a patient's room or in the operating room.

A radiologic technologist studies the theory and practice of the technical aspects of the use of X-rays and radioactive

materials in the diagnosis and treatment of disease. A radiologic technologist may specialize in radiography, radiation therapy, or nuclear medicine.

A radiation therapy technologist assists the radiologist—for example, in administering radiation treatments to patients who have cancer. He or she also may be responsible for maintaining radiation treatment equipment. The technologist shares responsibility with the radiologist for the accuracy of treatment records.

Registered Dietitian

Registered dietitians help patients and their families make healthful food choices. These choices provide balanced, adequate nutrition, particularly when disease or illness makes knowing what to eat to help fight the disease difficult. Dietitians are sometimes confused with nutritionists. A dietitian has specialized training to assist ill patients with their nutritional needs; a nutritionist's goal is for those of us who are healthy to maintain a lifestyle of healthful eating. Dietitians may assist food-service directors at healthcare facilities and prepare and serve food to groups. They also may participate in food research and teach nutrition classes. Dietitians work in a variety of healthcare settings and teach at colleges and universities.

Respiratory Therapy

A respiratory therapist evaluates, treats, and cares for patients with respiratory problems. The respiratory therapist works under the supervision of a licensed practitioner and performs therapeutic procedures based on observation of the patient. Using respiratory equipment, the therapist treats patients who have asthma, emphysema, pneumonia, and bronchitis. The respiratory therapist plays an active role in newborn, pediatric, and adult intensive care units.

Respiratory therapy technicians work under the supervision of a licensed practitioner and a respiratory therapist. In addition to performing procedures such as artificial ventilation, they clean, sterilize, and maintain the respiratory equipment and document the patient's therapy in the medical record.

Nursing Aide/Assistant

Nursing aides assist in the direct care of patients under the supervision of the nursing staff. Typical functions include making beds, bathing patients, taking vital signs, serving meals, and transporting patients to and from treatment areas. Certification as a certified nursing assistant (CNA) is available and is required by many healthcare facilities, especially long-term care facilities.

Practical/Vocational Nurse

Licensed practical nurses (LPNs) and licensed vocational nurses (LVNs) are different names for the same type of nurse. Their duties involve taking and recording patient temperatures, blood pressure, pulse, and respiration rates. They also include administering some medications under supervision, dressing wounds, and applying compresses. LPNs and LVNs

are not allowed, however, to perform certain other duties, such as some intravenous (IV) procedures and the administration of certain medications. LPNs/LVNs can obtain additional training to become certified in IV therapy.

Practical/vocational nurses assist registered nurses and licensed practitioners by observing patients and reporting changes in their conditions. LPNs/LVNs work in hospitals, long-term care facilities, clinics, and physicians' offices and in industrial medicine. To meet the needs of the growing aging population in this country, employment opportunities for LPNs and LVNs in long-term care settings have increased. LPNs/LVNs must graduate from an accredited school of practical (vocational) nursing (usually a 1-year program). They are also required to take a state board examination for licensure as LPNs/LVNs.

Registered Nurse

A nurse who graduates from a nursing program and passes the state board examination for licensure is considered a registered nurse (RN), indicating formal, legal recognition by the state. The RN is a professional who is responsible for planning, giving, and supervising the bedside nursing care of patients. An RN may work in an administrative capacity, assist in daily operations, oversee programs in hospital or institutional settings, or plan community health services. Registered nurses work in hospitals, long-term care facilities, public health agencies, physicians' offices, government agencies, and educational settings. They also may work in industry, providing on-site care at manufacturing facilities and other industrial workplaces.

Three types of nursing education programs qualify an individual to take a state board examination to become an RN: associate degree nurse, diploma graduate, and baccalaureate degree nurse.

Associate Degree Nurse Associate's degrees in nursing (ADNs) are offered at many junior colleges and community colleges and at some universities. These programs combine liberal arts education and nursing education. The length of the ADN program is typically 2 years.

Diploma Graduate Nurse Diploma programs are usually 3-year programs designed as cooperative programs between a community college and a participating hospital. The programs combine coursework and clinical experience in the hospital.

Baccalaureate Nurse A baccalaureate degree is awarded by a 4-year college or university program. Graduates of a 4-year nursing program are awarded a bachelor of science in nursing (BSN) degree. The curriculum includes courses in liberal arts, general education, and nursing. Graduates are prepared to function as nurse generalists and in positions that go beyond the role of hospital staff nurses. Some RNs with a BSN continue their education to earn master's or doctoral degrees.

Nurse Practitioner

A nurse practitioner (NP) is an RN who functions in an expanded nursing role. The NP usually works in an ambulatory patient care setting alongside physicians but also may work in an independent nurse practitioner practice without physicians. An independent nurse practitioner takes health histories, performs physical exams, conducts screening tests, and educates patients and families about disease prevention.

An NP who works in a physician's practice may perform some duties that a physician would, such as administering physical exams and treating common illnesses and injuries. For example, in an OB/GYN practice, the NP can perform a standard annual gynecologic exam, including taking a Pap smear or a culture to test for a yeast or bacterial infection. The nurse practitioner usually emphasizes preventive healthcare.

The NP must be an RN with at least a master's degree in nursing and must complete 4 to 12 months of an apprenticeship or formal training. With specific formal training, the student may become a pediatric nurse practitioner, an obstetric nurse practitioner (midwife), or a psychiatric nurse practitioner. Clinical medical assistants may work directly with an NP.

Physician Assistant

The physician assistant (PA) practices medicine under the laws of the specific state and the supervision of a physician. PAs provide diagnostic, therapeutic, and preventive healthcare services, as designated by the supervising physician. Physician assistants take medical histories; order laboratory and medical imaging tests; and examine, diagnose, treat, counsel, and follow up with patients. They also perform suturing, casting, and splinting for minor injuries, and some assist in surgery. PAs also prescribe certain medications. Some perform managerial duties, such as purchasing and maintaining equipment and hiring and firing personnel. The physician assistant also may take call duty for the practice and share the responsibility for afterhours call duty with the physician. A medical assistant may work directly with a physician assistant.

Speech/Language Pathologist

A speech/language pathologist treats communication disorders, such as stuttering, and associated disorders, such as hearing impairment. This health professional evaluates, diagnoses, and counsels patients who have these problems. A speech/language pathologist may work in a school, hospital, research setting, or private practice or may teach at a college or university.

► Specialty Career Options

LO 2.4

As a medical assistant, you have a multitude of opportunities to specialize by obtaining additional training, education, or certifications. You may determine that you prefer either the administrative or the clinical aspect of the work and move forward in your career toward that end. Tables 2-1 and 2-2 highlight some of the careers you may consider.

TABLE 2-1 Administrative Specialty Careers

Career	Duties	Organization(s)
Billing and insurance specialist	- Verifies patient insurance coverage - Processes insurance claims - Obtains fees for procedures and services performed, from both patients and insurance companies	American Medical Technologists (AMT), American Medical Billing Association (AMBA)
Certified Medical Reimbursement Specialist (CMRS)	- Facilitates the claims paying process “from patient to payment” - Plays a critical role in the healthcare provider’s daily business operations, whether employed by the medical facility or self-employed as a contractor to assist the practice with its accounts receivable processes	American Medical Billing Association
Compliance officer	- Reviews and updates the office’s policies and procedures manual - Creates and maintains appropriate coding and billing policies, including audit procedures - Creates, conducts, and manages compliance education programs for all staff - Establishes a process for investigating and taking action on all complaints about privacy policies and procedures - Publicizes the reporting system for all providers, staff, vendors, and business associates - Analyzes a facility’s risk of releasing information incorrectly and sets policies and procedures to avoid these risks	American Health Information Management Association’s Health Care Compliance Association (HCCA), American Academy of Professional Coders (AAPC)
Electronic claims professional	- Acts as the link between small and medium-sized practices and major health insurers such as Medicare - Contracts with a physician practice or healthcare facility, enters patient demographic and insurance billing information into billing software, and transmits it to the appropriate health insurance provider - Submits electronic medical (health) insurance claims to an insurance carrier	Alliance of Claims Assistance Professionals (ACAP), National Association of Claims Assistance Professionals (NACAP)
Medical biller and coder, health information coder, or medical coder	- Makes sure that all patient charges have been recorded in the billing system - Enters data such as charges into the patient accounts database - Prepares claims to send to payers such as insurance agencies - Prepares bills to send to patients - Tracks payments due from payers and patients	American Health Information Management Association (AHIMA), American Academy of Professional Coders (AAPC)
Medical transcriptionist	- Logs transcriptions of telephone calls or Internet transmissions - Sorts and distributes transcribed medical reports - Places the transcribed reports into the appropriate patient accounts in the electronic health records system	American Association for Medical Transcription
Registered Health Information Technician (RHIT), medical record technician, medical chart specialist	- Manages patient records for a physician, group of physicians, or hospital - Ensures that all medical information is accurate and complete - Deals strictly with health information in a hospital and has no patient contact - Performs additional clerical duties such as answering the telephone in a physician’s office - Checks all patient charts for completeness and accuracy	American Health Information Management Association

TABLE 2-2 Clinical Specialty Careers

Career	Duties	Organization(s)
Anesthesiologist assistant	- Provides anesthetic care under an anesthesiologist's direction - Gathers patient data and assists in evaluation of patients' physical and mental status - Records planned surgical procedures, assists with patient monitoring, draws blood samples, performs blood gas analyses, and conducts pulmonary function tests	American Academy of Anesthesiologist Assistants
Cardiovascular technologist	- Performs diagnostic examinations and therapeutic interventions of the heart and/or blood vessels at the request or direction of a licensed practitioner - Uses various cardiovascular testing techniques to create a foundation of data for patient diagnosis	Cardiovascular Credentialing International
Dental assistant	- Performs many administrative and laboratory functions similar to those of a medical assistant - Serves as chairside assistant, provides instruction in oral hygiene, and prepares and sterilizes instruments	American Dental Assistant Association
Emergency medical technician (EMT)	- Works under the direction of a licensed practitioner through a radio or cellular communication network - Assesses and manages medical emergencies that occur in private and public locations - Assesses the urgency and type of condition presented, as well as the immediate medical needs, and initiates the appropriate treatment in the process known as triage - Records, documents, and transmits the patient's condition to the licensed practitioner, describing what has occurred	National Association of Emergency Medical Technicians
Mental health technician (psychiatric aide or counselor)	- Works with emotionally disturbed and mentally challenged patients - Assists the psychiatric team by observing behavior and providing information to help in the planning of therapy - Participates in supervising group therapy and counseling sessions	American Association of Psychiatric Technicians
Occupational therapist assistant	- Helps individuals with mental or physical disabilities reach their highest level of functioning through the teaching of fine motor skills, trades (occupations), and the arts - Prepares materials for activities, maintains tools and equipment, and documents the patient's progress	American Occupational Therapy Association
Pathologist's assistant	- May work with forensic pathologists—professionals who study the human body and diseases for legal purposes—in cooperation with government or police investigations - May prepare frozen sections of dissected body tissue - May maintain supplies, instruments, and chemicals for the anatomic pathology laboratory - Performs laboratory work (about 75% of the workday) and a variety of administrative duties	
Pharmacy technician	- Receives written or electronic prescriptions or telephone requests for prescription refills - Verifies that the information on the prescription is complete and accurate - Contacts the insurance company to verify benefits and obtain any patient copay or coinsurance requirements - Retrieves, counts, pours, weighs, measures, and, if necessary, mixes the medication for the prescription (script) - Establishes and maintains patient profiles in the pharmacy computer and prepares insurance claim submissions - Takes inventory of prescription and over-the-counter (OTC) medications - Assists in equipment maintenance and management of the pharmacy cash register	National Pharmacy Technician Association and Pharmacy Technician Certification Board
Phlebotomist	- Draws blood for diagnostic laboratory testing - Performs more advanced skills, such as drawing blood under difficult circumstances or in special situations—for example, if a blood sample is needed for an ammonia-level test, it must be drawn and stored in a particular manner phlebotomists are trained to do	National Phlebotomy Association (NPA) or American Society of Clinical Pathologists (ASCP)
Physical therapy assistant	- Assists with patient treatment by following the patient care program created by the physical therapist and licensed practitioner - Performs tests and treatment procedures, assembles or sets up equipment for therapy sessions, and observes and documents patient behavior and progress	American Physical Therapy Association
Surgical technician	- Obtains a patient's history and physical data - Discusses the data with a physician or surgeon to determine what procedures to use to treat the problem - May assist in performing diagnostic and therapeutic procedures	National Board of Surgical Technology and Surgical Assisting

► Healthcare Professional Associations

LO 2.5

Membership in a professional association is important for your professional development and career advancement. As discussed in the *Introduction to Medical Assisting* chapter, being part of organizations such as American Association of Medical Assistants (AAMA) and American Medical Technologists (AMT) enables you to become involved in the issues and activities relevant to your field and presents opportunities for continuing education. It is a good idea to stay informed about other healthcare associations, even those that are open to physicians only, such as the American Medical Association. Also, the physician you work for may ask you to obtain

information about a particular group's activities and meetings, and by "staying in the loop," you will have better access to this information. Table 2-3 lists a few organizations that you should be familiar with.

Other organizations and professional associations help regulate healthcare. Some of the most important of these organizations are described here.

American College of Physicians

Founded in 1915, the American College of Physicians (ACP) is the largest medical specialty organization in the world. It is the only society of internists dedicated to providing education and information resources to the entire field of internal medicine and its subspecialties.

TABLE 2-3 Professional Medical Organizations

Professional Organization	Membership Requirements	Advantages of Membership
American Association of Medical Assistants (AAMA) http://www.aama-ntl.org	Interested individuals, including medical assisting students and those who practice medical assisting, may join the AAMA.	Offers flexible continuing education programs; publishes <i>CMA Today</i> ; offers legal counsel, professional recognition, and various member discounts
American Association of Professional Coders (AAPC) http://www.aapc.com	Anyone interested in the coding profession may join. Student memberships are available for those currently in a coding program, as are corporate memberships for groups of six or more employees.	Training, continuing education, multiple certifications for specialties (including compliance), job board, networking, local and state chapter memberships, discounts on coding books, and educational materials
American Medical Billing Association (AMBA) http://www.ambanet.net	Interested individuals and those who want to become Certified Medical Reimbursement Specialists (CMRS) may join.	Can prepare for and take the National Medical Billing Certification Exam, also many other services such as online training, insurance, networking, and credit card processing
Association for Healthcare Documentation Integrity (AHDl) http://www.ahdionline.org	Interested individuals and those who practice medical transcription may join the AHDl.	Educates and develops medical transcriptionists as medical language specialists; offers advice and support for self-employed medical transcriptionists
American College of Physicians (ACP) http://www.acponline.org	Physicians and medical students may join.	Provides education and information resources to the field of internal medicine and its subspecialties
American Health Information Management Association (AHIMA) http://www.ahima.org	Members may be students (of approved AHIMA programs only), AHIMA-credentialed members, and noncredentialed members interested in HIM and willing to abide by the association's code of ethics.	Subscription to <i>Journal of AHIMA</i> , legislative advocacy, professional development, discounts on services and programs, job postings, members-only website, and automatic enrollment in local and/or state chapter
American Hospital Association (AHA) http://www.aha.org	Institutional healthcare providers and other individuals may join.	Provides consultant referral service and access to healthcare information resources
American Medical Association (AMA) http://www.ama-assn.org	Physicians and medical students may join.	Provides large information source; publishes <i>Journal of the American Medical Association (JAMA)</i> ; offers AMA/Net
American Medical Technologists (AMT) http://www.americanmedtech.org	Medical assistants, medical technologists, medical laboratory technicians, dental assistants, and phlebotomy technicians may join.	Offers national certification as Registered Medical Assistant (RMA); offers certification to other healthcare professionals, publications, state chapter activities, and continuing education programs
American Pharmacists Association (APhA) http://www.pharmacist.com	Pharmaceutical professionals and physicians may join.	Helps members improve skills; active in pharmacy policy development, networking, publishing, research, and public education
American Society for Clinical Pathology (ASCP) http://www.ascp.org	Any professional involved in laboratory medicine or pathology may join.	Resource for improving the quality of pathology and laboratory medicine; offers educational programs and materials; certifies technologists and technicians

American Hospital Association

The American Hospital Association (AHA) is the nation's largest network of institutional healthcare providers. These providers represent every type of hospital: rural and city hospitals, specialty and acute care facilities, free-standing hospitals, academic medical centers, and health systems and networks. The AHA works to support and promote the interests of hospitals and healthcare organizations across the country. Organizations as well as individual professionals may join the AHA. Membership benefits include use of the AHA consultant referral service, accessed, for example, by hospitals that need experts in areas not addressed by in-house personnel. Members also have access to AHA's healthcare information resources, including teleconferencing and AHA database services.

The Joint Commission

The Joint Commission (TJC) is a US-based nonprofit organization with the goal of maintaining and elevating the standards of healthcare delivery through the evaluation and accreditation of healthcare organizations. TJC employs surveyors, who are sent to healthcare organizations to evaluate their operational practices and facilities. Healthcare organizations are highly motivated to do well during a survey because accreditation by TJC is a significant factor in gaining reimbursement from Medicare and managed care organizations. In addition to hospitals, TJC evaluates and accredits ambulatory care, behavioral healthcare, home care, laboratory service, long-term care, and office-based surgery facilities.

Starting in 2003, TJC established safety requirements, known as National Patient Safety Goals, to help accredited healthcare organizations address issues of patient safety that can lead to adverse events lawsuits. The goals, found at <http://www.jointcommission.org>, focus on patient safety problems and how to solve them. Table 2-4 lists the requirements of the National Patient Safety Goals.

Council of Ethical and Judicial Affairs

The Council of Ethical and Judicial Affairs (CEJA) develops ethics policy for the AMA. It is composed of seven practicing physicians, a resident or fellow, and a medical student. The council prepares reports that analyze and address timely ethical issues that confront physicians and the medical profession. CEJA maintains and updates the AMA Code of Medical Ethics. This code is widely recognized as the most comprehensive ethics guide for physicians who strive to practice ethically.

American Medical Association

The American Medical Association (AMA), founded in 1847, promotes science and the art of medicine and works to improve public health. Its members include physicians from every medical specialty. As the world's largest publisher of scientific and medical information, the AMA publishes 10 monthly medical specialty journals. The AMA also accredits its medical programs in the United States and Canada.

TABLE 2-4 2014 Ambulatory Care National Patient Safety Goals

The purpose of the National Patient Safety Goals is to improve patient safety. The goals focus on problems in healthcare safety and how to solve them.

Identify Patients Correctly	• Use at least two ways to identify patients. For example, use the patient's name <i>and</i> date of birth. This is done to make sure each patient gets the correct medicine and treatment. • Make sure that the correct patient gets the correct blood when they get a blood transfusion.
Use Medicines Safely	• Before a procedure, label medicines that are not labeled—for example, medicines in syringes, cups, and basins. Do this in the area where medicines and supplies are set up. • Take extra care with patients who take medicine to thin their blood. • Record and pass along correct information about a patient's medicines. Find out what medicines the patient is taking. Compare those medicines to new medicines given to the patient. Make sure the patient knows which medicines to take at home. Tell the patient it is important to bring an up-to-date list of medicines every time he or she visits a doctor.
Prevent Infection	• Use the hand cleaning guidelines from the Centers for Disease Control and Prevention or the World Health Organization. Set goals for improving hand cleaning. Use the goals to improve hand cleaning. • Use proven guidelines to prevent infection after surgery.
Prevent Mistakes in Surgery	• Make sure the correct surgery is done on the correct patient and at the correct place on the patient's body. • Mark the correct place on the patient's body where the surgery is to be done. • Pause before the surgery to make sure that a mistake is not being made.

Adapted from The Joint Commission 2014 National Patient Safety Goals from <http://www.jointcommission.org>, accessed November 28, 2014.

S U M M A R Y O F L E A R N I N G O U T C O M E S

LEARNING OUTCOMES	KEY POINTS
2.1 Discuss healthcare trends and their relationship to medical assistant practice.	Medical assistants typically work in ambulatory care settings using EHR. They can expect to work with many older patients and should practice and assist patients with preventive care.
2.2 Identify medical specialties and specialists certified by the American Board of Medical Specialties (ABMS).	The ABMS certifies 24 major medical specialties and subspecialties. Medical specialties range from cardiology to oncology. As new medical advances occur, a demand for more specialty areas may emerge.
2.3 Recognize the duties of various allied health professionals with whom medical assistants may work.	Medical assistants are members of a healthcare team. The healthcare team includes physicians, nurses, physical therapists, other allied health professionals, and patients. Understanding the duties of other healthcare professionals will assist you as a professional medical assistant. Even if you do not work with some of the team members directly, you may have to contact them through telephone, written, or electronic communication.
2.4 Compare specialty careers that a medical assistant may choose for advancement.	A variety of medical specialty careers are available for the practicing administrative or clinical medical assistant. These careers require additional training or education and/or other certifications.
2.5 Differentiate professional associations that relate to healthcare and explain their relationship to the medical assisting profession.	Being a member of a professional association is essential to medical assisting practice. Knowledge of other healthcare and medical organizations allows the practicing medical assistant to function successfully within his or her profession.

C A S E S T U D Y C R I T I C A L T H I N K I N G

© Karen Moskowitz/Getty Images

Recall Miguel Perez, the administrative assistant from the beginning of the chapter. Now that you have completed the chapter, answer the following questions about his case.

1. What should Miguel do first, and why? What type of healthcare professional will respond to the call?
2. Raja Lautu is going to be evaluated for cancer. What type of physician will Miguel most likely be calling for this consult?
3. Ken Washington will need to have his heart evaluated. What type of physician will most likely be consulted, and what type of allied health professional will perform a special test on his heart? What is the name of the test to be performed?
4. Miguel enjoys his work as an administrative medical assistant but would like to expand his role. What specialty career would you recommend for Miguel, and why?

EXAM PREPARATION QUESTIONS

1. (LO 2.2) Medical specialists who deal with the medical and surgical treatment of obesity are
 - a. Gastroenterologists
 - b. Allergists
 - c. Gynecologists
 - d. Bariatric surgeons
 - e. Neurologists
2. (LO 2.2) The abbreviation for a licensed doctor of podiatric medicine is
 - a. DPM
 - b. DVM
 - c. MD
 - d. OD
 - e. LDPM
3. (LO 2.5) The Joint Commission (TJC) is a US-based organization that
 - a. Offers continuing education for medical assistants
 - b. Provides credentialing for physicians
 - c. Maintains and elevates the standards of healthcare delivery through credentialing and accreditation
 - d. Obtains information for medical groups
 - e. Ensures the safety of employees in all facilities
4. (LO 2.4) Which of the following individuals should Miguel contact to verify Cindy Chen's insurance?
 - a. Medical technologist
 - b. Pharmacy technician
 - c. Registered health information technician
 - d. Medical billing and insurance specialist
 - e. Medical transcriptionist
5. (LO 2.3) Your patient is having treatments based on qi. Which healthcare professional is most likely performing the treatments?
 - a. Chiropractor
 - b. Doctor of osteopathy
 - c. Acupuncturist
 - d. Optician
 - e. Massage therapist
6. (LO 2.5) Which professional organization develops the National Patient Safety Goals?
 - a. ACP
 - b. AHA
 - c. TJC
 - d. AAMA
 - e. AMA
7. (LO 2.4) Which professional would *most* likely be working outside of a healthcare facility?
 - a. Occupational therapist assistant
 - b. Emergency medical technician/paramedic
 - c. Anesthetist's assistant
 - d. Physical therapy assistant
 - e. Surgical technician
8. (LO 2.3) Which healthcare team member can work independently, performing examinations and treating common illnesses?
 - a. Associate degree nurse
 - b. Radiologic technologist
 - c. Physical therapist
 - d. Medical records technologist
 - e. Nurse practitioner
9. (LO 2.1) Which of the following is a trend in healthcare that has a direct effect on how medical assistants perform their job?
 - a. Less hospitalized patients and more long-term care patients
 - b. More hospitalized patients and fewer ambulatory care patients
 - c. Lack of preventive healthcare practice and increased patient illness
 - d. Increased birth rate and more contact with elderly patients
 - e. Increased use of technology and EHR
10. (LO 2.1) What type of healthcare cares for patients who have terminal cancer or less than 6 months to live?
 - a. Long-term care
 - b. Ambulatory care
 - c. Hospital care
 - d. Hospice care
 - e. Laboratory care

Professionalism and Success

3

CASE STUDY

EMPLOYEE INFORMATION	Employee Name	Position	Credentials
	Kaylyn R. Haddix	Clinical Medical Assistant	RMA (AMT)
	Supervisor	Date of Hire	Other information
	Malik Katahri, CMM	06/11/XX	Meeting with Malik at 1 P.M.

Kaylyn R. Haddix does well with the “hands-on” skills and gets along fairly well with the other office personnel. However, Kaylyn has a problem with getting to work on time. She seems to show a pattern of poor planning, such as forgetting to set her alarm, losing her car keys, and neglecting to solve her various car problems when they first become apparent (brought on by skipped oil changes, worn tire treads, squeaky brakes, and a rusty muffler). The clinic suffers when

© Rubberball/Getty Images RF

Kaylyn is late because she is not ready to see the first patient upon arrival, causing patients to wait and disrupting the routines and schedules of other staff members. Following the third time she was late, Malik, the office manager, noted the problem in Kaylyn’s record and informed Kaylyn that chronic tardiness could lead to termination. Although Kaylyn is sometimes afraid to ask questions, her performance is generally above average, so Malik is hoping that Kaylyn will improve.

Keep Kaylyn in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

LEARNING OUTCOMES

After completing Chapter 3, you will be able to:

- 3.1** Recognize the importance of professionalism in the medical assisting practice.
- 3.2** Explain the professional behaviors that should be exhibited by medical assistants.
- 3.3** Model strategies for success in medical assisting education and practice.

KEY TERMS

attitude	persistence
comprehension	prioritizing
constructive criticism	problem solving
critical thinking	punctuality
cultural diversity	self-confidence
empathy	soft skills
hard skills	teamwork
integrity	time management
organization	work ethic
patient advocacy	work quality

- V.A.1** Demonstrate:
- empathy
 - active listening
 - nonverbal communication
- V.A.2** Demonstrate the principles of self-boundaries
- V.A.3** Demonstrate respect for individual diversity including:
- gender
 - race
 - religion
 - age
 - economic status
 - appearance
- XI.P.2** Demonstrate appropriate responses to ethical issues
- XI.A.1** Recognize the impact personal ethics and morals have on the delivery of healthcare

5. Psychology of Human Relations

- Provide support for terminally ill patients
 - Use empathy when communicating with terminally ill patients
- Intervene on behalf of patient regarding issues/concerns that may arise, i.e. insurance policy information, medical bills, physician/provider orders, etc.

11. Career Development

- Demonstrate professional behavior

► Introduction

A profession is an occupation or a career based upon specialized educational training. Professionalism is behavior that exhibits the traits or features that correspond to the standards of that profession. Professional standards vary from occupation to occupation, and some vary within the same occupation, depending on the environment. And, of course, these standards go way beyond just personal appearance, although they do include this. Imagine the difference between the professional standards required of a commercial jet pilot who logs thousands of miles despite tough weather conditions and is responsible for the lives of 200-plus passengers at any given time versus those of a hobby pilot who likes to fly his Cessna solo for a few hours on sunny weekends. Will their uniforms or dress codes be different? Is punctuality equally important in both cases? Luckily, you will not need to worry too much about airplanes as a medical assistant, but this is just one example of how professional standards may differ in a particular industry.

As discussed in *Introduction to Medical Assisting*, standards for medical assisting education and the profession are developed by professional organizations, such as the American Association of Medical Assistants (AAMA) and the American Medical Technologists (AMT). To be a professional medical assistant, not only do you need to know standards of the profession but you must also be able to exhibit appropriate personal attributes and behaviors.

Success is a favorable or desired outcome. To achieve a favorable or desired outcome from your medical assisting education and in practice, you must follow the standards and exhibit the personal behaviors established by your school and workplace. In this chapter, you will explore the professional

behaviors required of a medical assistant in school and in practice, as well as the attributes and strategies needed for success in your education and career.

► Professionalism in Medical Assisting

LO 3.1

The mere fact that you are reading this book means you are embarking on the profession of medical assisting. To understand this profession, you should first understand what a profession consists of. A profession has two areas of competence (abilities):

- Hard skills**—specific technical and operational proficiencies
- Soft skills**—personal qualifications or behaviors that enhance an individual's interactions, job performance, and career prospects; these are sometimes called people skills (Figure 3-1)

Hard skills represent the minimum proficiencies necessary to do the job. Following are some examples of hard skills of medical assisting:

- Scheduling appointments
- Coding for insurance purposes
- Managing medical records
- Interviewing patients
- Taking vital signs
- Assisting a provider with patient examinations

These hard skills are the ones you will learn throughout this program, and your ability to perform them is readily observable. Your hard skills set is the first screen employers use to determine if you are qualified for the position.

FIGURE 3-1 As a medical assistant, you need to have both technical skills (hard skills) and people skills (soft skills) and maintain a good balance between them.

Soft skills are less concrete and more difficult to observe and evaluate. These are the characteristics, attributes, or **attitudes** that people develop throughout their lives. Some examples are respect, dependability, and integrity. These personal attributes or qualities, which are sought after and significant for specific jobs, are also professional attributes or behaviors, and they tend to help define an individual's personality. Your professional behaviors together produce what is called a good **work ethic**, which is what employers seek.

A medical assisting credential and the technical skills associated with it are the reasons most graduates are hired. However, the lack of a specific soft skill or poor professional behavior is the reason for most terminations. Weakness in the soft skills is also the major reason that some students do not successfully complete their medical assisting education. So knowing how to do something is important, but behaving professionally while practicing is essential.

Much of the medical assistant's role involves dealing with other people, whether this is a patient, a patient's family member, a coworker, an insurance agent, a pharmaceutical sales representative, a laboratory staff member, or anyone else with whom you may come in contact in the workplace. Because most professional behaviors and skills are about working with other people, it only makes sense that someone going into a profession that continually deals with people should possess these behaviors and skills to do a good job. As a student and in your medical assisting career, you will experience the ongoing assessment of your professional behaviors in the following environments:

- Classroom
- Student work experience
- Hiring process

- Workplace performance evaluation
- Promotion consideration

So no matter the circumstance, your professionalism contributes to your success and should always be on the top of your list of ongoing self-improvements. For example, what if a medical assistant did not know the proper instructions to give a patient regarding a diagnostic test? She was either too shy (lacked self-confidence) to ask or chose not to ask because of a lack of time or neglect. Consequently, she gave instructions based on what she thought might be appropriate (lacked knowledge). So it is highly probable that the patient would not be adequately prepared for the test. The results of this poor decision might be

- Difficulty in performing the test on the patient.
- Cancellation of the test, wasting time and resources.
- Repetition of the test, incurring increased costs that may not be reimbursed by insurance.
- Inaccurate test results, leading to incorrect diagnosis and treatment and a poor patient outcome.
- Potential litigation (lawsuit) against the medical practice.

The issue is not that the medical assistant did not know the correct instructions but that the medical assistant did not use the correct behaviors (communication, cooperation, knowledge, persistence, work quality) to obtain and give the correct instructions. Although this scenario seems exaggerated, it has occurred. The importance of professional behaviors cannot be overemphasized.

► Professional Behaviors

LO 3.2

Certain behaviors distinguish medical assistants who behave professionally from those who just get by, as well as those who do not make it. Professional behaviors contribute to your overall success in life—as a medical assistant and as a human being on this planet. Let's explore essential medical assisting professional behaviors. As you read each of the following sections, take a moment to consider whether you exhibit this behavior or quality. When you have completed this section, review the sample self-evaluation document and Procedure 3-1, Self-Evaluation of Professional Behaviors, at the end of the chapter.

Comprehension

Comprehension is the ability to learn, retain, and process information. In order to function as a medical assistant, you must comprehend your role and responsibilities. This means not only to have information but also to be able to analyze that information, to know how to use it, and to retain it, no matter how infrequently you might use it. An example of comprehension is learning how to take a blood pressure, including the equipment needed, the steps in the procedure, what results to expect, how to record the results, and when to report a problem.

Persistence

Persistence is continuing in spite of difficulty—being determined and overcoming obstacles. Two other words for

persistence are *perseverance* and *tenacity*. The slang is *stick-to-itiveness*. This attribute ensures that you will finish the job no matter how difficult, boring, annoying, or time-consuming it may be. One example that is not uncommon in the medical office is trying to reach a patient whose contact information is not up-to-date. The issue may be an abnormal laboratory report that requires follow-up or another vital matter. The practitioner must be able to count on you and know that you will follow through and make contact no matter how difficult it may be. The patient's well-being often depends on it.

Self-Confidence

Self-confidence means believing in oneself. It is a trait that puts people at ease. The patient, the physician, and others are more comfortable when they feel that you know what you are doing. The self-assured medical assistant is generally the one that the patient and the physician prefer to work with. However, some people are self-confident to excess, which is not a professional trait. Have you ever felt a test was easy, but when the score came back you did less than great? That is overconfidence. On the other hand, self-confidence is a professional trait that makes you desirable to be around. An overconfident person acts as if she knows everything; a self-confident person knows what she knows and what she doesn't know. Display your self-confidence by smiling, making eye contact, and remaining calm no matter what the situation.

Judgment

Judgment is evaluating a situation, reaching an appropriate conclusion, and acting accordingly. It is also referred to as **critical thinking** (Figure 3-2). Critical thinking is defined as purposeful decisions resulting from analysis and evaluation. You will examine the steps of critical thinking in the next section. Applying sound judgment in all situations—even when you are distracted, upset, or annoyed—is necessary as a medical assistant.

Knowledge

Knowledge is understanding gained through study and experience. Medical assisting is a profession that requires

understanding theory (knowledge) and then applying psychomotor skills or hands-on experience. You will acquire knowledge by learning the principles and then performing the procedures. Students who do not have an understanding of the procedure and only memorize the steps may have difficulty performing when equipment varies or if a procedure is done differently (yet correctly) at the externship site. These students are often unable to function when the procedure does not go as planned. So it is best to understand the rationale for what you are doing. Avoid just memorizing steps.

Organization

Organization is planning and coordinating information and tasks in an orderly manner to efficiently complete a job in a given time frame. This attribute has many aspects, including time management and prioritizing, which will be discussed in more detail in the next section. Organization is required to know how to prioritize the issues and tasks while addressing them all in an efficient and timely manner. One example is prioritizing your work—deciding which are the most important tasks of the day and which are less important. On a day when everything seems to be “top priority,” you must use your professional judgment, knowledge of office policies, and experience with providers and coworkers to determine what should be completed first, second, third, and so on.

Integrity

Integrity is adhering to the appropriate code of law and ethics and being honest and trustworthy. Ethics is a system of values that determines right or wrong behavior. Integrity involves relatively simple matters, such as not taking pens home from the workplace, to more complex matters, such as always being truthful with patients. It also deals with subjects that are punishable and illegal, such as taking cash, cheating on an exam, or falsifying a time card. Falsifying a time card is clearly dishonest, but knowingly extending breaks or lunches demonstrates a lack of integrity. Knowing that a coworker or a classmate is doing something dishonest is another area of integrity (Figure 3-3).

FIGURE 3-2 Using sound judgment through critical thinking requires (a) identifying a problem, (b) analyzing methods to solve it, and (c) determining an acceptable method to solve it.

FIGURE 3-3 Being dishonest or not reporting something that you observe that is dishonest reduces your integrity and trustworthiness.

© Digital Vision RF

If you do not report your facts or suspicion of the act, you could be considered an accomplice and subject to a penalty. Besides causing harm, once a person is involved in a dishonest act or is seen as lacking integrity, it is very difficult to regain the trust of others. The *Legal and Ethical Issues* chapter provides more details about standards of integrity that involve morals, laws, and ethics.

Growth

Growth is an ongoing effort to learn and improve. Being a professional brings with it an obligation to keep up with new standards, methods, procedures, and technologies in the field. Throughout this text and your medical assisting program, you will learn current practices. However, healthcare practices change frequently. For example, electronic health records (EHR) are replacing paper health records, and the standards for cardiopulmonary resuscitation (CPR) change frequently. Growth requires staying informed.

As discussed in the *Introduction to Medical Assisting* chapter, you should join one or more of the medical assisting professional organizations, such as AAMA or AMT. Besides receiving the benefits, you are expected to earn a specific number of continuing education units (CEUs) within a specified time frame. These CEU offerings are credits given by the organization for participating in approved professional educational offerings. CEUs help you grow professionally and stay up-to-date with the latest information through taking seminars, reading articles, taking courses, and completing CEU modules, which may be accessed online, on a DVD, or in print.

Teamwork

Teamwork is working with others in the best interest of completing the job. The healthcare team, described in the *Healthcare and the Healthcare Team* chapter, is large and

complex. Like any team, its members must work together and cooperate with each other in order to increase the likelihood of achieving the goal. Also, studies show that in workplaces where staff members cooperate and help each other, job satisfaction and patient (client) satisfaction are high.

In the healthcare practice, the overall goal should be providing good patient care, which is done through cooperation between team members. Everyone in the facility has an important job that depends on someone else. It is important to remember that the patient comes first and everyone is responsible for the care of that patient.

Another important aspect of teamwork and professionalism is the correct use of personal cell phones and other electronic devices while at work. Personal cell phones and other devices should never be used while you are working. Depending on the workplace policy, use of a personal cell phone or iPad may be allowed when you are on break, but otherwise you should place the device on mute or “airplane mode” and store it while you are working. In the same vein, although you may think of the computer you use at work as “yours,” it belongs to your employer. Visiting social websites, such as Facebook, or checking personal e-mail or Twitter accounts should never be considered. Also, keep in mind that your work e-mail is not yours, either. Any e-mail you send from your work e-mail address reflects on your workplace and employer. Any sites you visit or e-mails you send may be tracked at any time by your employer. If you are tempted to send a “quick e-mail” to a friend or “quickly” check your Facebook account, remember, your employer and/or IT department has access to your work computer or network drive. Your employer will not ask you to work for him or her on your time; you should not be accessing personal websites and e-mail on work time.

Teamwork also requires coordination, which is the integration of activities. A typical patient may have three or more physician specialists, several prescriptions, home healthcare, routine blood work, physical therapy, hospital care, and outpatient procedures. This requires multiple appointments, insurance companies, medical claims, and other processes. These processes require all the members of the team to work together for the benefit of the patient. Frequently, coordinating these patient care activities is the role of the medical assistant and requires cooperation and coordination with everyone involved. Team dynamics consist of

- Assisting each other on a daily basis with the duties required.
- Avoiding interpersonal conflict with members of the team.
- Performing extra responsibilities without questioning or complaining.
- Being considerate of all other team members’ duties and responsibilities.

Acceptance of Criticism

Acceptance of criticism is the willingness to consider feedback and suggestions to improve; it is taking responsibility for one’s actions. In this context, let’s focus on **constructive criticism**, which is counseling or advice that is intended to be useful with

FIGURE 3-4 Accepting constructive criticism to improve your performance is essential to medical assisting practice. Get yourself inside the green zone.

the goal of improving something. To grow and understand the areas in which you can improve, you must be able to accept constructive criticism (Figure 3-4). This may come from medical assisting educators, classmates, physicians, coworkers, or even patients. You will be evaluated throughout your education and workplace experience. Never expect a perfect evaluation, because no one is perfect and improvements can always be made. Instead, be open to accepting criticism and suggestions and offer your own thoughts on what you can do to improve. Do not be defensive or blame others. It is not about what your classmate or coworker does; it is about you.

Relations with Others

Relations with others—the ability to get along with those around you—involves treating everyone with respect and caring even when it is difficult. This sometimes includes **empathy**, feeling and understanding another’s experience without having the experience yourself. In the healthcare environment, the medical assistant works with many patients who are experiencing great loss. It may be the loss of health or function or a terminal diagnosis. Or it may be a personal loss, such as the death of a spouse. As in any other workplace, coworkers also experience losses and unfortunate events. Sometimes medical assistants are very kind to patients but do not exhibit the same behaviors with coworkers. With coworkers, they may become involved in gossip and pettiness or display impatience and rudeness.

Caring is showing concern and appropriate attention, whereas enabling, or codependency, in this context is doing for others the things that they should be doing for themselves. When you enable, you become part of the disease process. For example, a young medical assistant learned this early in her career when she became attached to a 10-year-old juvenile diabetic patient. Every time the child came into the office, the MA gave her a stuffed animal or other gift. The patient started to have more and more problems and the office visits became more frequent. An experienced medical assistant pointed out that the child was being rewarded for not managing her

illness. This exemplifies enabling. Instead of giving a gift (reward) for not managing the disease and becoming ill, the two medical assistants developed a more appropriate reward system for the patient if her diabetes was kept under control.

Professional Boundaries Having professional boundaries, or limitations, means always treating a patient as a client and not becoming involved in issues of his or her private life that do not directly relate to the healthcare. This is often difficult, especially with patients you see often and particularly enjoy, and with patients you feel you may be able to help in addition to providing care in the medical office. Generally, the guidelines for maintaining professional boundaries are

- Address the patient only by his or her last name unless first asking permission to use his or her first name (children are an exception).
- Avoid offering advice on personal matters.
- Use only tasteful, appropriate humor.
- Avoid becoming excessively friendly.
- Avoid giving or accepting money from a patient.
- Decline meeting a patient outside of the workplace unless you were acquainted prior to taking your position.

Cultural Diversity Have you heard the expression “it takes all kinds”? Professionalism involves understanding people who are different from you and respecting their right to be different. After all, from their point of view, you are the one who is different! Healthcare facilities serve patients from many countries who speak many languages. The variety of human social structures, belief systems, and strategies for adapting to situations in different parts of the world is referred to as **cultural diversity**. Showing respect to all individuals, regardless of culture, race, religion, age, gender, sexual orientation, physical challenges, special needs, lifestyle choices, or socioeconomic standing, impacts your relations with others (Figure 3-5). Being respectful does not mean that you have to agree with the lifestyles and beliefs of others. It means that you accept the idea that others have every right to be different

FIGURE 3-5 Respect and understanding for everyone is an essential professional behavior for the medical assistant.

© Terry Vine/Getty Images RF

from you, and as a medical assistant you treat them appropriately. The following list gives some ideas that may help you understand and respect diversity.

- Increase your awareness of diversity. Communication with patients and coworkers will help you learn about individual similarities and differences.
- Increase your awareness of your own feelings. Everyone has biases. People tend to stereotype others, and this can lead to discrimination. Examine your own biases. Are they realistic?
- Look at individuals. As you learn about people as individuals, any group stereotypes you have often begin to break down.

Patient Advocacy As a medical assistant, you may be in a position to speak or act on behalf of the patient or the patient’s family. This is called **patient advocacy**. Understanding your scope of practice, as well as being professional in your relations with others and being a good communicator, will help you be an effective advocate for the patient. Be sure you have all the facts before you act, and include your supervisor or licensed practitioner as needed. Table 3-1 provides some examples of patient advocacy decisions.

Work Quality

Work quality means striving for excellence in doing the job and having pride in your performance. If you feel you need improvement in an area or would like to learn a new skill, consider taking a course, asking your supervisor or a coworker for help, or spending more time in that area. If you have an idea to improve a work process, make a suggestion. If you see something that is a potential risk, report it. Never say, “It is not my job.” If it is not your job, simply state that you will get the person who can help and then get that person. Getting the job done is the focus. Being flexible is another part of work quality. If a staff member is absent or the schedule changes, the important thing is to get the job done. Again, do not worry about whose job it is as long as you are staying within your scope of practice.

Another way to look at this is to believe that patients are “customers” of the practice and, as such, deserve excellent customer service. Basically, this boils down to two things: The patient comes first and the patient is satisfied. When working with a patient, give him or her your undivided attention. Happy patients return to a practice and tell their friends about their experience. Be more than simply an employee; be part of building the practice. Keeping the following skills

TABLE 3-1 Examples of Patient Advocacy		
Circumstance	Example	Suggested Action
You have concern for the individual’s safety.	You suspect an elderly patient is being abused.	Discuss with licensed practitioner; follow legal requirements and office protocols for reporting suspected elder abuse.
A complex situation requiring your level of expertise.	A patient is having difficulty with an insurance claim.	Assist the patient as needed.
A potentially bad situation exists that your knowledge may help to avoid or resolve.	You are aware that a patient will not fill a prescription for an expensive drug because he cannot afford the insurance copay.	Inform the physician, who may prescribe a generic version of the drug, or, with the physician’s approval, contact the drug company to obtain free or reduced medications or contact a local pharmacy that provides low-cost medications if available.
Giving extra attention is likely to benefit the patient.	You are reviewing a 1-year-old patient’s profile and notice that she is probably eligible for a nutritional program called WIC (Women, Infants, and Children).	Take the time to explain the program to the mother and provide the information for her to enroll.
The patient is capable of advocating for himself or herself.	The patient does not want to tell the physician that he does not understand why he needs a proposed procedure.	Encourage the patient to talk to the physician and assure him it is not unusual for patients to not fully understand the first time information is presented.
Anything that can be considered medical advice or a medical recommendation should be avoided.	The patient is asking your telephone advice regarding his symptoms.	Avoid saying anything that involves a potential diagnosis, such as “that sounds like the flu”; follow the office protocol for scheduling an appointment.
The action interferes with your job duties or presents a potential liability.	A patient asks you to keep an eye on her children during her exam.	Suggest the patient reschedule when she can arrange childcare; if needed, provide a contact number for a facility close to the office.
There are reasonable options.	A patient forgets to fill his monthly prescriptions and is consistently asking for an emergency refill. The office policy is that refills will be processed in 3 business days. He wants you to call and remind him each month.	Suggest to the patient that many pharmacies provide a monthly automatic refill or a monthly reminder.

sharp and using them consistently will lead to excellent customer service in the medical office.

- Using proper telephone techniques
- Writing or responding to telephone messages
- Explaining procedures to patients
- Expediting insurance referral requests
- Assisting with billing issues
- Answering questions or finding answers to patient questions
- Ensuring that patients are comfortable in your office
- Creating a warm and reassuring environment

Punctuality and Attendance

Being on time—**punctuality**—and coming to work every day that you are scheduled are essential for maintaining your job. Poor attendance is a frequent reason for termination. You are expected to be at your duty station or in your classroom, ready to work at the given time. Whether you are late or absent as a result of poor planning or an emergency, it still means that either your job is not getting done or you created additional work for your teammates. Patient care is impacted when you are not present. Recall Kaylyn in the chapter-opening case study, who is at risk for termination for frequent tardiness. Do not let this be you.

Professional Appearance

A medical professional always strives to maintain a neat appearance in the workplace, and personal cleanliness is an important part of this. Your appearance is the first impression you make on your patients, coworkers, and the physicians you work with. Medical facilities are considered “conservative” work environments, and your appearance should reflect a conservative style. Listed here are a few professional guidelines to follow in the medical environment:

- Your approved uniform or other clothing should be clean, pressed crisply, fit properly, and in good repair.
- Your shoes should be comfortable, white, clean, and in good condition. Open-toed shoes should not be worn in the patient treatment areas to prevent injury or infection to yourself.
- Choose a hairstyle that is flattering and conservative. Hair should be clean and pulled back from your face and off your collar if it is long. Natural colors for hair are the most acceptable colors in a medical environment.
- Your nails should be kept at a short working length, no more than one-fourth of an inch, and of a natural color. Acrylic nails should not be worn, as they pose a risk for infection.
- Body odors, including the odor of smoke, are offensive. Even pleasant odors such as hairspray, perfumes, and lotions may trigger nausea or allergies in some patients and should be avoided.
- Jewelry should be kept to a minimum and in good taste. No more than one ring should be worn. Rings may tear through exam gloves. Ears can be pierced with one hole, and small

earrings are appropriate. Avoid dangling earrings, as patients (particularly pediatric patients) can tear these off.

- Visible tattoos, body piercings, and tongue piercings are not acceptable.

Communication

Effective communication involves careful listening, observing, speaking, and writing. Communication even involves good manners—being polite, tactful, and respectful. You must use good communication skills during every patient discussion and in every interaction you have with providers, other staff members, and other professionals with whom your practice does business.

Communication is giving and receiving accurate information. If a person is a bad communicator, it means that he or she cannot communicate or provide information that is accurate or understandable. Sometimes the patient leaves the office confused because he or she did not understand medical terms that were used and did not communicate that he or she did not understand. Sometimes the student leaves class confused because he or she did not understand the assignment and did not communicate to the instructor that he or she did not understand. In these scenarios, communication was poor from the sender, since it was not understood. It was also poor from the receiver, since lack of understanding was not communicated back to the sender. Effective communication is a two-way process, with a responsibility on both sides. It impacts every aspect of healthcare and is discussed in-depth in the *Interpersonal Communication* chapter.

► Strategies for Success

LO 3.3

As you move toward and through your career as a medical assistant, you should be constantly improving your professional behaviors, as discussed earlier. As a medical assistant, you must practice specific strategies to ensure your success. These strategies include critical thinking and problem solving, time management and prioritizing, and stress management. The sections that follow will discuss these strategies, provide examples, and explain how to practice them.

Critical Thinking and Problem Solving

You will develop critical thinking skills over time as you apply your knowledge about and experience with human nature, medicine, and office skills to new situations. Critical thinking skills include quickly evaluating circumstances, solving problems, and taking action. For example, you must use critical thinking skills to assess how to react to emergency situations. If you see a patient suddenly pass out in the office reception area, you must immediately see that the patient receives first aid, notify a physician, and alert the patient’s family.

Critical thinking skills are used every day, and critical thinking relies on sound judgment. More specifically, critical thinking involves the ability to

- Analyze situations.
- Determine what aspects of a situation are most important.
- Reach conclusions that go beyond the obvious.

Critical thinking includes both factual problem identification and creative decision-making skills. It is the ability to see the whole picture and to reach reasonable conclusions based on the most important facts.

Problem solving can be broken down into a step-by-step approach (Figure 3-6):

- Identify the problem and define it clearly.
- Identify the potential effects of the problem.
- Clearly identify the objectives to be achieved.
- Identify as many potential solutions and strategies as possible.
- Analyze the potential solutions and strategies.
- Implement the strategy that appears to be the best solution.
- Evaluate the results and repeat the steps as needed.

Let's use the problem-solving steps to solve a patient problem. A patient approaches your desk and complains loudly that he does not have all day to wait for the doctor to see him. His appointment was at 2:00 and the time is now 2:40. The patient is obviously angry about the delay. What should you do?

Step 1. Identify and define the problem: What is wrong with the patient?

The patient is angry because the physician did not see him promptly at his appointment time.

Step 2. Identify the potential effects of the problem: What effects might the patient's anger have?

The patient is disrupting the office; the practice may lose this client.

Step 3. Identify the objectives to be achieved: What is your goal for this situation?

Your goal is to end the disruption and calm the patient.

Step 4. Identify potential solutions and strategies: What can you do to end the disruption and calm the patient?

This is the step where you may be able to come up with more than one answer. For example, you may want to (a) inform your supervisor that the patient is causing a disruption, (b) ask the physician to talk to the patient, (c) tell the patient there is nothing you can do about it, or (d) explain the situation to the patient quietly and offer to reschedule the appointment. Remember that problem solving is not an exact science. You are attempting to come up with solutions so you can determine the one that will most effectively solve the problem.

FIGURE 3-6 Use critical thinking and good judgment when following the steps of the problem-solving process.

*Step 5. Analyze the potential solutions and strategies.
What are the possible results from each solution?*

For (a), you discover that the supervisor is busy in a room with another patient, and waiting for her to become available will allow the disruption to continue. For (b), you recall that the physician expects the office staff to take care of this type of incident. For (c), you suspect that telling the patient you cannot do anything will not make him less angry. For (d), you think that talking quietly to the patient and offering to reschedule the appointment might work.

Step 6. Implement the best solution. What solution did you choose?

You explain that an emergency earlier in the day put the physician behind schedule and offer to reschedule the patient's appointment for a more convenient time. Of course, you will need to use your judgment to provide an explanation without violating the confidentiality of the patient who had the emergency earlier.

Step 7. Evaluate the results and repeat the steps as needed. How did it go? Is the patient satisfied and calmer now? If not, try a different strategy.

This step is important because learning from experience counts. If you chose to wait for the supervisor to become available to handle the situation, and the patient stalked out of the office, saying he would not be back, you would hopefully do something different if faced with the same circumstance again. In this case, you explained the reason for the delay and offered to reschedule the patient, and he calmed down and decided to wait for the physician to see him.

Time Management and Prioritizing

Personal and professional time management skills are essential for medical assistants. **Time management** is controlling how you spend your time. People who use time management techniques routinely are the highest achievers in all walks of life, professionally and personally. Using these skills will help you function exceptionally well in the medical office, even under intense pressure. Even more importantly, you can say goodbye to the often intense stress of work overload. Setting goals and concentrating on results, not just being busy, are the main focus of time management.

Medical assistant students who are disorganized waste a great deal of time locating assignments and other materials before they get started on their work. Prepare in advance. Purchase a binder, notebook, or folders for storing your homework assignments, reminders about upcoming tests, your course syllabus, and other pertinent facts, such as your instructor's office hours and contact information and your classmates' information for study sessions. Obtain computer access with an Internet connection at home, through your school, or at the local library. Try these tips for organization:

- Study in a quiet area away from distractions.
- Find a study "buddy" who is just as committed to and focused on success as you are.

- Formal classroom courses require at least as much work time outside of class as inside it to prepare, so allow yourself enough preparation time.
- Budget your time between school and other responsibilities.
- Set aside study time by creating a study schedule.
- Set daily, weekly, or course-specific goals to accomplish the overall goal of completing your course.

The medical assistant must be organized. For example, the phone may be ringing at the same time a patient is trying to schedule a follow-up appointment, while the physician is inquiring about the results of a diagnostic report, and a coworker is asking for information about a patient's immunizations. To be an effective medical assistant, you must be able to manage your time and **prioritize** effectively. When you prioritize, you decide on the order in which tasks should be completed based on things such as the task deadline and importance. Evaluate yourself, and use the following ideas to improve your ability to manage time and prioritize.

1. Have a plan for your day. Know what needs to be done. Set your daily goals and try to meet them.
2. Take advantage of your own productivity. That is, you may work better at a particular time of day. Choose to do the most difficult tasks when you are working at your best. Remember, everybody has sluggish times, so know when yours are—maybe right after lunch or near the end of the day. Plan accordingly.
3. Avoid distractions when you can. Of course, if your job is to answer the phone, then you must do so. But if someone is just chatting or your smartphone is constantly beeping to signal text messages, this probably means you are not accomplishing what needs to be done. Personal phone calls, text messages, tweets, or other communications are not supposed to occur during your working hours. However, business electronic communication is vital. Consider setting specific times during the day to look at business e-mail so you will not have constant interruptions.
4. Evaluate yourself on a daily basis. Consider whether you accomplished your daily goal and come up with a plan to continue or do better the next day.

Stress and Burnout Professionals in the healthcare field, including medical assistants, may experience high levels of stress in their daily work environment. Stress can result from a feeling of being under pressure, or it can be a reaction to anger, frustration, or a change in your routine. Stress can increase your blood pressure, speed up your breathing and heart rate, and cause muscle tension. Stress also can cause you to behave or communicate ineffectively. For example, if you are feeling very pressured at work, you might snap at a coworker or patient, or you might forget to give the provider an important message.

Good or Bad Stress A certain amount of stress is normal. A little bit of stress—the kind that makes you feel excited or challenged by the task at hand—can motivate you to get things done and push you toward a higher level of productivity. For example, your supervisor may ask you to learn a new procedure. Learning something new, although stressful in itself, can be an exciting challenge and a welcome change of pace. Ongoing stress, however, can be overwhelming and affect you physically. For example, it can lower your resistance to colds and increase your risk for developing heart disease, diabetes, high blood pressure, ulcers, allergies, asthma, colitis, and cancer. It also can increase your risk for certain autoimmune diseases, which cause the body’s immune system to attack normal tissue.

Some stress at work is inevitable. An important goal is to learn how to manage or reduce stress. Take into account your strengths and limitations, and be realistic about how much you can handle at work and in your life outside work. Pushing yourself a certain amount can be motivating. The *Points on Practice* box lists the potential causes of stress and ways to reduce stress.

Preventing Burnout Burnout is the end result of prolonged periods of stress without relief, an energy-depleting condition that will affect your health and career. Certain personality types are more prone to burnout than others. If you are a highly driven, perfectionist-type person, you will be more susceptible to burnout. Experts often refer to such a person as a characteristic Type A personality. A more relaxed, calm individual is considered a Type B person. Type B personalities are less prone to burnout but have the potential to suffer from it, especially if they work in healthcare.

According to some experts on stress, there are five stages of burnout:

1. *The honeymoon phase.* During the honeymoon phase, your job is wonderful. You have boundless energy and enthusiasm, and all things seem possible. You love the job and the job loves you. You believe it will satisfy all your needs and desires and solve all your problems. You are delighted with your job, your coworkers, and the organization.
2. *The awakening phase.* The awakening stage starts with the realization that your initial expectations were unrealistic.

The job is not working out the way you thought it would. It does not satisfy all your needs, your coworkers and the organization are less than perfect, and rewards and recognition are scarce. As disillusionment and disappointment grow, you become confused. Something is wrong, but you cannot quite put your finger on it. Typically, you work harder to make your dreams come true. But working harder does not change anything and you become increasingly tired, bored, and frustrated. You may question your competence and ability and start losing your self-confidence.

3. *The brownout phase.* As brownout begins, your early enthusiasm and energy give way to chronic fatigue and irritability. You become indecisive and your productivity drops. Your work deteriorates. Coworkers and managers may even comment on it. You become increasingly frustrated and angry and project the blame for your difficulties onto others. You are cynical, detached, and openly critical of the organization, superiors, and coworkers. You are beset with depression, anxiety, and physical illness.
4. *The full-scale burnout phase.* Unless you interrupt the process or someone intervenes, brownout drifts remorselessly into full-scale burnout. Despair is the dominant feature of this final stage. It usually takes 3 to 4 years to get to this phase. You experience an overwhelming sense of failure and a devastating loss of self-esteem and self-confidence. You become depressed and feel lonely and empty. You talk about just quitting and getting away. You are exhausted physically and mentally and prone to physical and mental breakdowns.
5. *The phoenix phenomenon.* Just like a phoenix, you can arise from the burnout ashes. But this takes time. First, you need to rest and relax. Do not take work home. If you are like many people, the work will not get done and you will only feel guilty for being lazy. Second, be realistic in your job expectations as well as your aspirations and goals. Third, create balance in your life. Invest more of yourself in family and other personal relationships, social activities, and hobbies. Spread yourself out so that your job does not have such an overpowering influence on your self-esteem and self-confidence.

POINTS ON PRACTICE

Potential Causes of Stress

Sometimes stress can be difficult to measure. Just like varying thresholds for pain, different people can tolerate different amounts of stress. One person's stress may seem a lot worse than another's. For example, who can say that the stress you may be feeling over an upcoming exam is less nerve-wracking than the stress someone else may be feeling about paying off a large credit card balance? Stress can come in many forms from many directions, but here is a list of common potential causes.

- Death of a spouse or family member
- Divorce or separation
- Hospitalization (yours or a family member's) due to injury or illness
- Marriage or reconciliation from a separation
- Loss of a job or retirement
- Sexual problems
- A new baby
- Significant change in your financial status (for better or worse)
- Job change
- Children leaving or returning home
- Significant personal success, such as a promotion at work
- Moving or remodeling your home
- Problems at work, such as your boss's retiring, that may put your job at risk
- Substantial debt, such as a mortgage or overspending on credit cards

Tips for Reducing Stress

Managing your stress levels can benefit your overall well-being, both mentally and physically, at work and at home. The following is a list of helpful, doable tips for lowering stress.

- Maintain a healthy balance in your life among work, family, and leisure activities.
- Exercise regularly.
- Eat balanced, nutritious meals and healthful snacks.
- Avoid foods high in caffeine, salt, sugar, and fat.
- Get enough sleep.
- Allow time for yourself, and plan time to relax.
- Rely on the support that family, friends, and coworkers have to offer. Do not be afraid to share your feelings.
- Try to be realistic about what you can and cannot do. Do not be afraid to admit that you cannot take on another responsibility.
- Try to set realistic goals for yourself. Remember, there are always choices, even when there appear to be none.
- Be organized. Good planning can help you manage your workload.
- Redirect excess energy constructively; clean your closet, work in the garden, volunteer, invite friends for dinner, or exercise.
- Change some of the things you have control over.
- Stay focused. Focus your full energy on one thing at a time and finish one project before starting another.
- Identify sources of conflict and try to resolve them.
- Learn and use relaxation techniques, such as deep breathing, meditation, or imagining yourself in a quiet, peaceful place. Choose what works for you.
- Maintain a healthy sense of humor, as laughter can help relieve stress. Joke with friends after work. See a funny movie.
- Try not to overreact. Ask yourself if a situation is really worth getting upset or worried about.
- Seek help from social or professional support groups, if necessary.

PROCEDURE 3-1 Self-Evaluation of Professional Behaviors

WORK // DOC

Procedure Goal: To identify necessary professional behaviors and relate them to yourself in order to improve your performance as a medical assistant

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Self-Evaluation Form (Figure Procedure 3-1)

Method:

1. Read and review each professional behavior.
2. Rate yourself on each behavior, considering the level at which you exhibit them.

3. Identify at least one measure to improve yourself on each behavior, as needed.
4. Place the completed form in your portfolio and review it on an ongoing basis.
5. Reevaluate your professional behavior prior to your applied training experience (practicum).
6. Compare the two scores and identify any weaknesses.
7. Obtain feedback about your professional behaviors from your instructor, coworkers, classmates, practicum coordinator, or employer.

Behavior	Example(s)	Rate Yourself (5 = Best)					Improvements Needed
		1	2	3	4	5	
Integrity	Consistently honest; able to be trusted with the property of others; can be trusted with confidential information; completes tasks accurately						
Appearance	Clothing and uniform appropriate for circumstance; neat, clean, and well-kept appearance; good personal hygiene and grooming						
Teamwork	Places the success of the team above self-interest; does not undermine the team; helps and supports other team members; shows respect to all team members; remains flexible and open to change; communicates with others to help resolve problems						
Self-confidence	Demonstrates the ability to trust personal judgment; demonstrates an awareness of strengths and limitations; exercises good personal judgment						
Communication	Speaks clearly; writes legibly; listens actively; adjusts communication strategies to various situations						
Commitment to diversity	Consistently demonstrates respect for varied cultural backgrounds, ethnicities, religions, sexual orientations, social classes, abilities, political beliefs, and disabilities						
Punctuality and attendance	Arrives at class and work on the appointed day and time						
Acceptance of criticism	Listens when constructive criticism is given; does not become defensive with criticism; appreciates constructive criticism and incorporates suggestions into behavior as appropriate						
Organization	Coordinates more than one task at a time; keeps work area neat and orderly; anticipates future work; works efficiently and systematically						
Knowledge and comprehension	Learns new things easily; retains new information; associates theory with practice						

FIGURE Procedure 3-1 Self-evaluation of professional behaviors.

S U M M A R Y O F L E A R N I N G O U T C O M E S

LEARNING OUTCOME

3.1 Recognize the importance of professionalism in the medical assisting practice.

KEY POINTS

Professionalism is behavior that exhibits the traits or features corresponding to the standards of that profession. Standards are developed by professional organizations and, in some states, by governmental entities. The skills are placed in two broad categories: hard skills and soft skills. Hard skills are specific technical and operational proficiencies. Soft skills are personal attributes or behaviors that enhance an individual. Professional behaviors are needed to function at a high level in medical assisting and produce a good work ethic.

LEARNING OUTCOME	KEY POINTS
3.2 Explain the professional behaviors that should be exhibited by medical assistants.	Some essential professional behaviors include comprehension—learning, retaining, and processing information; persistence—continuing in spite of difficulty; self-confidence—believing in oneself; judgment—evaluating and determining an appropriate conclusion; organization—coordinating information and tasks in an orderly manner; integrity—adhering to law and ethics; growth—engaging in ongoing efforts to learn and improve; teamwork—working with others in the best interest of completing the job; acceptance of criticism—being willing to consider feedback and suggestions to improve; relations with others—getting along with all people in all circumstances; work quality—striving for excellence in doing the job; punctuality and attendance—showing up on appointed days and times; professional appearance—adhering to the standards and codes of dress; and communication—giving and receiving accurate information.
3.3 Model strategies for success in medical assisting education and practice.	Strategies for success as a medical assistant include cultivating your skills, such as critical thinking and problem solving, time management and prioritizing, stress management, and avoidance of burnout. Practicing effective strategies can assist you during your education and employment.

CASE STUDY CRITICAL THINKING

© Rubberball/Getty Images RF

Recall Kaylyn Haddix from the beginning of the chapter. Now that you have completed this chapter, answer the following questions regarding her case.

1. Why do you think Malik wants to meet with Kaylyn?
2. What professional behaviors does Kaylyn need to improve?
3. What strategies for success could Kaylyn use to prevent herself from losing her job?

EXAM PREPARATION QUESTIONS

1. (LO 3.1) The primary reason an employee is hired is usually associated with
 - a. Hard skills
 - b. Soft skills
 - c. References
 - d. Punctuality
 - e. Cooperation
2. (LO 3.1) Which of the following is considered a soft skill?
 - a. Communicating with a patient
 - b. Measuring a patient's height
 - c. Taking a telephone message
 - d. Taking a patient's vital signs
 - e. Scheduling an appointment
3. (LO 3.2) An indication that a person lacks integrity would be exhibited by
 - a. Being rude to a coworker
 - b. Coming into work late
 - c. Ignoring the dress code
 - d. Taking money from the cash drawer
 - e. Gossiping
4. (LO 3.2) A significant part of critical thinking is
 - a. Memorizing
 - b. Analyzing
 - c. Being tenacious
 - d. Empathizing
 - e. Criticizing

5. (LO 3.2) Adhering to the dress code and good personal hygiene demonstrates
 - a. Persistence
 - b. Growth
 - c. Respect
 - d. Knowledge
 - e. Organization
6. (LO 3.2) If a medical assistant is not self-confident, this may lead to the patient feeling
 - a. Confident
 - b. Neglected
 - c. Apprehensive
 - d. Ignored
 - e. Ill
7. (LO 3.2) An example of enabling, or codependency, would be
 - a. Providing a wheelchair for a patient who is weak
 - b. Helping a patient identify a community resource
 - c. Scheduling a patient's next appointment
 - d. Offering cookies to an obese patient
 - e. Calling a taxi for a patient
8. (LO 3.2) Maintaining professional boundaries involves
 - a. Showing a patient you care by being personal
 - b. Being friendly but not excessively affectionate
 - c. Avoiding any touch with the patient
 - d. Babysitting for a patient
 - e. Buying the patient lunch
9. (LO 3.3) Your coworker likes to talk about her kids and husband, usually right after lunch as you are returning to work and patients. What should you do?
 - a. Talk with your coworker as much as you can, since it is important to have good relationships at work
 - b. Talk with your coworker, since some personal discussions at work are OK anyway
 - c. Consider telling your supervisor that your coworker talks too much and you find it disturbing
 - d. Request that your supervisor ask your coworker to not talk to you so much because you cannot get your work done
 - e. Realize that the time you speak with your coworker is preventing you from completing your goals, so politely explain this to your coworker
10. (LO 3.3) Once you have considered what the problem is and what effects it will have, what should you do next?
 - a. Implement a solution
 - b. Identify the problem
 - c. Determine multiple solutions
 - d. Determine the effects of the solution
 - e. Evaluate your solution to determine if it works or worked

SOFT SKILLS SUCCESS

Learning the technical, or hard, skills required of a medical assistant is important. Why are the soft skills considered just

as, if not more, important than these hard skills? Discuss at least four soft skills you will need as a medical assistant.

Interpersonal Communication

4

CASE STUDY

PATIENT INFORMATION	Patient Name	DOB	Allergies
	Cindy Chen	7/15/19XX	NKA
	Attending	MRN	Other Information
	Alexis N. Whalen, MD	324-86-542	History of depression

Cindy Chen, a 28-year-old female, arrives at your office complaining of the inability to sleep and nervousness. She tested positive for HIV in 2014, although she has been asymptomatic

© Red Chopsticks/Getty Images RF

on antiviral drugs. Currently, she lives with her aunt and is going to school to become a phlebotomist. During her interview she asks, “Just feeling so nervous. Do you have anything you can give me until I see the doctor?”

Keep Cindy Chen in mind as you study this chapter. There will be questions at the end of the chapter based on

the case study. The information in the chapter will help you answer these questions.

 **ACTIVSim**

LEARNING OUTCOMES

After completing Chapter 4, you will be able to:

- 4.1 Identify elements and types of communication.
- 4.2 Relate communication to human behavior and needs.
- 4.3 Categorize positive and negative communication.
- 4.4 Model ways to improve listening, interpersonal skills, and assertiveness skills.
- 4.5 Carry out therapeutic communication skills.
- 4.6 Use effective communication strategies with patients in special circumstances.
- 4.7 Carry out positive communication with coworkers and management.

KEY TERMS

- | | |
|------------------|----------------------|
| active listening | hierarchy |
| aggressive | homeostasis |
| assertive | hospice |
| body language | interpersonal skills |
| boundaries | open posture |
| closed posture | passive listening |
| conflict | personal space |
| feedback | rapport |

- V.C.1** Identify styles and types of verbal communication
- V.C.2** Identify types of nonverbal communication
- V.C.3** Recognize barriers to communication
- V.C.4** Identify techniques for overcoming communication barriers
- V.C.5** Recognize the elements of oral communication using a sender-receiver process
- V.C.14** Relate the following behaviors to professional communication:
 - (a) assertive
 - (b) aggressive
 - (c) passive
- V.P.1** Use feedback techniques to obtain patient information including:
 - (a) reflection
 - (b) restatement
 - (c) clarification
- V.P.2** Respond to nonverbal communication
- V.P.5** Coach patients appropriately considering:
 - (a) cultural diversity
 - (b) developmental life stage
 - (c) communication barriers
- V.A.1** Demonstrate:
 - (a) empathy
 - (b) active listening
 - (c) nonverbal communication
- V.A.3** Demonstrate respect for individual diversity including:
 - (a) gender
 - (b) race
 - (c) religion
 - (d) age
 - (e) economic status
 - (f) appearance

5. Psychology of Human Relations

- a. Respond appropriately to patients with abnormal behavior patterns
- b. Provide support for terminally ill patients
 - (1) Use empathy when communicating with terminally ill patients
 - (2) Identify common stages that terminally ill patients experience
 - (3) List organizations/support groups that can assist patient and family members of patients experiencing terminal illnesses
- c. Intervene on behalf of the patient regarding issues/concerns that may arise, i.e. insurance policy information, medical bills, physician/provider orders, etc.
- d. Discuss developmental stages of life
- e. Analyze the effect of hereditary, cultural, and environmental influences on behavior

8. Administrative Procedures

- f. Display professionalism through written and verbal communications

9. Clinical Procedures

- j. Make adaptations with patients with special needs

11. Career Development

- b. Demonstrate professional behavior

► Introduction

Think about the last time you had a doctor's appointment. How well did the staff and physician communicate with you? Were you greeted pleasantly and invited to take a seat, or did someone thrust a clipboard at you and say, "Fill this out"? If you had a long wait in the reception area or examination room, did someone come in to explain the delay? Did you become frustrated and angry because nobody told you what was happening? The abilities to recognize human behaviors

and to communicate effectively are vital to a medical assistant's success. This chapter takes a psychological approach to understanding human behavior and the challenges that influence therapeutic communication in a healthcare setting.

As the key communicator within the healthcare facility, the medical assistant must be able to communicate with each patient with professionalism and diplomacy. This includes patients from different cultures, socioeconomic backgrounds, educational levels, ages, and lifestyles. The medical assistant sets the tone for the communication circle and must be aware

FIGURE 4-1 The process of communication involves an exchange of messages through verbal and nonverbal means.

of all the obstacles that can affect human communication. It is important that patients develop a good rapport and feel confident in the care they are receiving from your office. Developing strong communication skills in the medical office is just as important as mastering administrative and clinical tasks.

► Elements of Communication LO 4.1

As you interact with patients and their families, you will be responsible for giving information and ensuring that the patient understands what you, the doctor, and other staff members have communicated. You also will be responsible for receiving information from the patient. For example, patients will describe their symptoms. They also may discuss their feelings or ask questions about a treatment or procedure. The giving and receiving of information forms the communication circle.

The Communication Circle

The communication circle involves three elements: a message, a source, and a receiver. Messages are usually verbal, written, or nonverbal. (You will explore more about nonverbal messages later in this chapter.) The source sends the message, and the receiver receives it. The communication circle is formed as the source sends a message to the receiver and the receiver responds (Figure 4-1).

Consider the following example, in which Miguel, BWB's clinical medical assistant, is speaking with Sylvia Gonzales, a patient who is having physical therapy for a back injury. Watch the communication circle at work.

Miguel: The physical therapist says you're making great progress and that you can start on some simple back exercises at home. I'd like to go over them with you. Then I'll give you a sheet that illustrates the exercises. How does that sound to you?

Sylvia Gonzales: I'm a little nervous about doing exercises. I still have some pain when I bend over.

Miguel:

I understand. It's important, though, to start using those muscles again. Why don't you show me exactly where it hurts? Then we can go over proper body mechanics, such as bending down to pick something up and getting in and out of chairs, the car, and bed. Then we'll just start with one or two of the exercises and save the rest for next time, when you're feeling more ready.

Sylvia Gonzales:

Okay, I will try, but I only feel up to doing a little bit today.

In this example, the medical assistant (the source) gives a verbal message about back exercises to the patient (the receiver). The patient responds by drawing attention to her pain and uneasiness about certain movements (feedback). The patient's response is also a message to the medical assistant, who responds in turn. The giving and receiving of information continues within the communication circle until the exchange is finished.

Feedback The patient's response, or **feedback**, is verbal or nonverbal evidence that the receiver got and understood the message. When you communicate information to a patient or ask a patient a question, always look for feedback. For example, if you calculate a pregnant patient's due date and tell her she's 12 weeks pregnant, look for a response. If she responds, "Oh, good, that means I'm out of danger of having a miscarriage," you may respond by saying that whereas most miscarriages occur in the first 12 weeks, some risk of miscarriage remains throughout the pregnancy. If she responds, "I thought I was 14 weeks pregnant," you need to clarify how you worked out your calculation and compare it with hers, to uncover any discrepancy. Good communication in the medical office requires patient feedback at every step.

Noise Anything that changes the message in any way or interferes with the communication process can be referred to as noise. *Noise* refers not only to sounds, such as a siren or jackhammer on the street below the medical office suite, but also to room temperature and other types of physical comfort or discomfort, such as pain, and to emotions, such as fear or sadness. If patients are feeling uncomfortable in a chilly or hot room, upset about their illness, or in great pain, they may not pay close attention to what you are saying. Conversely, if you are feeling upset about a personal problem outside work or if you are unwell or preoccupied with all the things you have on your to-do list, you may not communicate well.

As you deal with each patient, try to screen out or eliminate causes of noise. For example, before you start a conversation with a patient in an examination room, you might ask, "Are you too chilly or too warm? Is the temperature in here comfortable for you?" If there is construction going on outside the building, see if there is a less noisy inner room or office that you might use. If a patient seems nervous or upset, address those feelings before you launch into a factual discussion.

If you are feeling stressed or out of sorts, that feeling constitutes a type of noise. Try to take a “breather” between patients or a break from desk work—walk downstairs, get some fresh air, stretch your legs. Feeling dehydrated or hungry affects your communication efforts, too. Limit your caffeine and sugar intake. Drink plenty of water throughout the day. Eat a good breakfast and lunch and healthful snacks. Leave your personal problems at home.

► Human Behavior and Needs LO 4.2

Medical assistants are exposed to many different personality types in addition to different illnesses. When you understand why a person is behaving in a certain way, you can adjust your communication style to adapt to that person. For example, as highly structured healthcare organizations and technological advances rapidly change the face of healthcare, many patients feel that healthcare is becoming impersonal, and consequently they may become difficult. Every time you communicate with patients, you can counteract this perception by playing

a humanistic role in the healthcare process. Being humanistic means that you work to help patients feel attended to and respected as individuals, not just as descriptions in a chart. Remember to always treat each patient as an individual and not simply as the disease, condition, or problem that brought the patient to the office. The problem may be common to you, but it is new and often frightening for the patient. To humanize and improve communication, you should have an understanding of the developmental stages of the life cycle and Maslow’s hierarchy of human needs.

Developmental Stages of the Life Cycle

Understanding the stages of human growth and development will enable you to enhance your communication skills, including patient education, with patients of all age groups, cultures, and religions. Human growth includes physical, psychological, and emotional growth. Many scientists and behaviorists have studied the developmental stages of human life and have developed guidelines to assist healthcare practitioners and staff in applying effective patient communication skills. Figure 4-2 is

FIGURE 4-2 Lifespan development.

an example of a lifespan development model, created by Erik Erikson (1902–1994).

Maslow's Hierarchy of Human Needs

Abraham Maslow, a well-known human behaviorist, developed a model of human behavior known as the **hierarchy** (classification) of needs (Figure 4-3). This hierarchy states that human beings are motivated by unsatisfied needs and that certain lower needs have to be satisfied before higher needs, such as self-actualization, are met. Maslow felt that people are basically trustworthy, self-protecting, and self-governing and that humans tend toward growth and love. He believed that humans are not violent by nature but are violent only when their needs are not being met.

Deficiency (Basic) Needs According to Maslow, there are general types of needs—physiological, safety, love/belonging, and esteem—that must be satisfied before a person can act unselfishly. He called these deficiency (basic) needs.

Physiological Needs Physiological needs are humans' very basic needs, such as air, water, food, sleep, and sex. When these needs are not satisfied, we may feel sickness, irritation,

pain, and discomfort. These feelings motivate us to alleviate them as soon as possible to establish **homeostasis** (a state of balance, or equilibrium). Once our basic needs are met and our feelings are alleviated, we may think about other things.

Safety Needs People have the need and desire to establish stability and consistency. These basic needs are security, shelter, and a safe environment.

Love/Belonging Needs Humans have a desire to belong to groups: clubs, work groups, religious groups, families, and so on. We need to feel loved and accepted by others. Humans are like pack animals—we place great importance in belonging to society.

Esteem Needs Humans like to feel that they are important and valuable to society. There are two types of self-esteem. The first results from competence, or mastery of a task, such as completing an educational program. The second is the attention and recognition that come from others.

Self-Actualization Self-actualization is finding self-fulfillment and realizing one's potential. To reach this level, a

FIGURE 4-3 Maslow's hierarchy.

person utilizes many tools to maximize potential, such as education, a fulfilling career, and a balanced personal life. Self-actualized people are generally comfortable with who they are and know their strengths and weaknesses.

Considering Patients' Needs When working and communicating with patients, remember this hierarchy of human needs and observe what need a patient is deficient in. For example, if an elderly patient has recently lost her husband, she may feel lonely and deficient in the love need. You may see homeless patients who are deficient in their physiological and safety needs. You may have a young girl as a patient who is overweight and has low self-esteem. On the other hand, you may have a high-level executive as a patient who has reached self-actualization. Each of these scenarios would require a communication style adjustment in order for you to effectively communicate with these patients.

► Types of Communication

LO 4.3

Each type of communication (verbal, nonverbal, or written) can be positive or negative. An effective communicator is familiar with these types of communication. This chapter focuses on verbal and nonverbal communication.

Positive Verbal Communication

In the medical office, communication that promotes patient comfort and well-being is essential. Treating patients brusquely or rudely is unacceptable in the healthcare setting. It is your responsibility to set the stage for positive communication.

When information—even bad news—is communicated with some positive aspect, patients are more likely to listen attentively and respond positively themselves. For example, you might explain to a patient who is about to get an injection, “This will sting, but only for a couple of seconds. When we are through, you are free to go.” You would not just say, “This is going to hurt.”

Other examples of positive communication are

- Being friendly, warm, and attentive (“It’s good to see you again, Mrs. Armstrong. I know you’re on your lunch hour, so let’s get started right away.”).
- Verbalizing concern for patients (“Are you comfortable?” “I understand it hurts when I do this; I’ll be gentle.” “This paperwork won’t take long at all.”).
- Encouraging patients to ask questions (“I hope I’ve explained the procedure well. Do you have any questions, or are there any parts you would like to go over again?”).
- Asking patients to repeat your instructions to make sure they understand (“Will you explain to me how you plan to take your medicine?”).
- Looking directly at patients when you speak to them.
- Smiling (naturally, not in a forced way).
- Speaking slowly and clearly, being sure to pronounce words correctly.
- Listening carefully.

Negative Verbal Communication

Most people do not purposely try to communicate negatively. Some people, however, may not realize that their communication style has a negative impact on others. Look for and ask for feedback to help you curb negative communication habits. Ask yourself, “Do the physicians and my other coworkers seem glad to speak with me? Are they open and responsive to me? Do patients seem at ease with me, or are they very quiet, turned off, or distant?” (Note that some patients may respond this way because of the way they feel, not because of the way you are communicating with them.) Here are some examples of negative communication (verbal and nonverbal):

- Mumbling
- Speaking brusquely or sharply
- Avoiding eye contact
- Interrupting patients as they are speaking
- Rushing through explanations or instructions
- Treating patients impersonally
- Making patients feel they are taking up too much of your time or asking too many questions
- Forgetting common courtesies, such as saying please and thank you
- Showing boredom

A good way to avoid negative communication is to open your eyes and ears to others in service-oriented workplace settings.

The next time you buy something at a store, call a company for information over the phone, or eat at a restaurant, take note of the way the staff treat you. Do they answer your questions courteously? Do they give you the information you ask for? Do they make you feel welcome? What specifically makes their communication style positive or negative? You expect good customer service, and so do your patients, as discussed in the chapter *Professionalism and Success*. Remember, you can always improve your communication skills, and learning by observing others is a great start.

Nonverbal Communication

Whereas verbal communication is communication that is spoken, nonverbal communication, or **body language**, consists of facial expressions, eye contact, posture, touch, and attention to personal space. In many instances, people’s body language conveys their true feelings, even when their words say otherwise. A patient might say, “I’m OK about that,” but if she is sitting with her arms folded tightly across her chest and avoids looking at you, she may not mean what she says.

Facial Expression Your face is the most expressive part of your body. You can often tell whether someone has understood your message simply by his facial expression. For example, when you are explaining a procedure to a patient, look at his expression. Does he seem puzzled? Is his brow wrinkled? Does he look surprised? Facial expressions can give you clues about how to tailor your communication efforts. They also serve as a form of feedback. As stated previously, your facial

expressions are just as important as your words. Remain open and interested in what the patient is saying. Never look bored or impatient with a patient.

Eye Contact Eye contact is an important part of positive communication. Look directly at patients when speaking to them. Looking away or down communicates that you are not interested in the person or that you are avoiding her for some reason. Be aware of cultural differences. For example, in some cultures, it is common to avoid eye contact out of respect for someone who is considered a superior. Thus, children may be taught not to look adults in the eye.

Posture The way you hold or move your head, arms, hands, and the rest of your body can project strong nonverbal messages. During communication, posture can usually be described as open or closed.

Open Posture A feeling of receptiveness and friendliness can be conveyed with an **open posture**. In this position, your arms lie comfortably at your sides or in your lap. You face the other person, and you may lean forward in your chair. This demonstrates that you are listening and are interested in what the other person has to say. Open posture is a form of positive communication.

Closed Posture A **closed posture** conveys the opposite of open posture—a feeling of not being totally receptive to what is being said. It also can signal that someone is angry or upset. A person in a closed posture may hold his arms rigidly or fold them across his chest.

He may lean back in his chair, away from the other person. He may turn away to avoid eye contact. He may even slouch—a kind of closed posture that can convey fatigue or lack of caring. Watch for patients with closed postures that may indicate tension or pain. Avoid closed postures yourself; they have a negative effect on your communication efforts.

Touch Touch is a powerful form of nonverbal communication. A touch on the arm or a hug can be a means of saying hello, sharing condolences, or expressing congratulations. Family background, culture, age, and gender all influence people's perception of touch. Some people may welcome a touch or think nothing of it. Others may view touching as an invasion of their privacy. In general, in the medical setting, a touch on the shoulder, forearm, or back of the hand to express interest or concern is acceptable.

Personal Space When communicating with others, it is important to be aware of the concept of personal space. **Personal space** is an area that surrounds an individual. By not intruding on patients' personal space, you show respect for their feelings of privacy. In most social situations, it is common for people to stand 4 to 12 feet away from each other. For personal conversation, you would typically stand between 1 and 4 feet away from a person. Some patients may feel uncomfortable and become anxious when you stand or sit close to them. Others prefer the reassurance of having people close to them when they speak. Watch patients carefully. If they lean back

when you lean forward or if they fold their arms or turn their head away, you may be invading their personal space. If they lean or step toward you, they may be seeking to close up the personal space.

► Improving Your Communication Skills

LO 4.4

Sharpening your communication skills should be an ongoing effort and will help you become a more effective communicator. Among the skills involved in daily communication are listening skills, interpersonal skills, and assertiveness skills.

Listening Skills

Listening involves both hearing and interpreting a message. Listening requires you to pay close attention not only to what is being said but also to nonverbal cues communicated through body language.

Listening can be passive or active. **Passive listening** is simply hearing what someone has to say without the need for a reply. An example is listening to a news program on the radio; the communication is mainly one-way. **Active listening**, on the other hand, involves two-way communication. You are actively involved in the process, offering feedback or asking questions. As seen in Figure 4-4, active listening takes place, for example, when you interview a patient for her medical history. Active listening is an essential skill in the medical office.

Ways to improve your listening skills include

- Prepare to listen. Position yourself at the same level (sitting, standing) as the person who is speaking and assume an open posture.
- Relax and listen attentively. Do not simply pretend to listen to what is being said.
- Maintain eye contact and appropriate personal space.

FIGURE 4-4 Active listening requires two-way communication and positive body language.

© Sean Justice/Getty Images

- Think before you respond.
- Provide feedback. Restate the speaker's message in your own words to show that you understand.
- If you do not understand something that was said, ask the person to repeat it.

Interpersonal Skills

When you interact with people, you use **interpersonal skills**. When you make a patient feel at ease by being warm and friendly, you are demonstrating good interpersonal skills. In addition to warmth and friendliness, valuable interpersonal skills include empathy, respect, genuineness, openness, consideration, and sensitivity.

Warmth and Friendliness A friendly but professional approach, a pleasant greeting, and a smile get you off to a good start when communicating with patients. When your approach is sincere, patients will be more relaxed and open.

Empathy The process of identifying with someone else's feelings is empathy. When you are empathetic, you are sensitive to the other person's feelings and problems. When you are sympathetic, you feel sorry *for* or feel pity *for* the person and his or her circumstances, but you don't really understand them. When you are empathetic, you are feeling *with* the person, putting yourself in his or her shoes. For example, if a patient is experiencing a migraine headache and you have never had one, you can still let her know you are trying to imagine, or relate to, her situation. In other words, you can acknowledge the severity of her pain and show support and care. If you were sympathetic to the patient's migraine, you would feel sorry that she did not feel well, but you would not try to put yourself in her shoes (or head) to understand how she is feeling.

Respect Showing respect can mean using a title of courtesy such as "Mr." or "Mrs." when communicating with patients. It also can mean acknowledging a patient's wishes or choices without passing judgment.

Genuineness Being genuine in your interactions with patients means that you refrain from "putting on an act" or just going through the motions of your job. Patients like to know that their healthcare providers are real people. In a medical setting, being genuine means caring for each patient on an individual basis, giving patients the full attention they deserve, and showing respect for them. Being genuine in your communication with patients encourages them to place trust in you and in what you say.

Openness Openness means being willing to listen to and consider others' viewpoints and concerns and being receptive to their needs. An open individual is accepting of others and not biased for or against them.

Consideration and Sensitivity You should always try to show consideration toward patients and act in a thoughtful, kind way. You must be sensitive to their individual concerns, fears, and needs.

Assertiveness Skills

As a professional, you need to be assertive—to be firm and to stand by your principles while still showing respect for others. Being assertive means trusting your instincts, feelings, and opinions (not in terms of diagnosing, which only the licensed practitioner can do, but in terms of basic communication with patients) and acting on them. For example, when you see that a patient looks uneasy, speak up. You might say, "You look concerned. How can I help you feel more comfortable?" versus asking the patient, "What is the matter with you?" Being assertive is different from being aggressive. When people are **aggressive**, they try to impose their position on others or try to manipulate them. Aggressive people are bossy and can be quarrelsome. They do not appear to take into consideration others' feelings, needs, thoughts, ideas, and opinions before they act or speak. To be **assertive**, you must be open, honest, and direct. Be aware of your body position: An open posture conveys the proper message. When you communicate, speak confidently and use "I" statements such as "I feel . . ." or "I think . . ."

Developing your assertiveness skills increases your sense of self-worth and your confidence as a professional. Being assertive will also help you prevent conflicts or resolve them more peacefully and increase your leadership ability. People look up to and respect professionals who are assertive in the workplace. See Table 4-1 for a comparison of nonassertive, assertive, aggressive, and nonassertive aggressive behaviors.

Therapeutic Communication Skills LO 4.5

Therapeutic communication is the ability to communicate with patients in terms they can understand. At the same time, it helps patients to feel at ease with what you are saying. It is also the ability to communicate with other team members in technical terms that are appropriate in a healthcare setting. Therapeutic communication techniques can improve communication with patients. This communication must remain within your scope of practice, as discussed in the *Points on Practice* box. Therapeutic communication involves the following skills:

- *Being silent.* Silence allows the patient time to think without pressure.
- *Accepting.* This skill gives the patient an indication of reception. It shows that you have heard the patient and follow the patient's thought pattern. Some indicators of acceptance include nodding; saying "Yes," "I follow what you said," and other such phrases; and body language.
- *Giving recognition.* Show patients that you are aware of them by stating their name in a greeting or by noticing positive changes. With this skill, you are recognizing the patient as a person or an individual.
- *Offering self.* Make yourself available to the needs of the patient.
- *Giving a broad opening.* Allow the patient to take the initiative in introducing the topic. Ask open-ended questions such as "Is there something you'd like to talk about?" or "Where would you like to begin?"

TABLE 4-1 A Comparison of Nonassertive, Assertive, Aggressive, and Nonassertive Aggressive Behaviors

	Nonassertive Behavior	Assertive Behavior	Aggressive Behavior	Nonassertive Aggressive Behavior (NAG)
Characteristics of the Behavior	Emotionally dishonest, indirect, self-denying; allows others to choose for self; does not achieve desired goal	Emotionally honest, direct, self-enhancing, expressive; chooses for self; may achieve goal	Emotionally honest, direct, self-enhancing at the expense of another, expressive; chooses for others; may achieve goal at expense of others	Emotionally dishonest, indirect, self-denying; chooses for others; may achieve goal at expense of others
Your Feelings	Hurt, anxious, possibly angry later	Confident, self-respecting	Righteous, superior, derogative at the time and possibly guilty later	Defiance, anger, self-denying; sometimes anxious, possibly guilty later
The Other Person's Feelings Toward You	Irritated, pity, lack of respect	Generally respected	Angry, resentful	Angry, resentful, irritated, disgusted
The Other Person's Feelings About Himself/ Herself	Guilt or superior	Valued, respected	Hurt, embarrassed, defensive	Hurt, guilty or superior, humiliated

- *Offering general leads.* Give the patient encouragement to continue by making comments such as “Go on” or “And then?”
- *Making observations.* Make your perceptions known to the patient. Say things like “You appear tense today” or “Are you uncomfortable when you . . . ?” By calling patients’ attention to what is happening to them, you encourage them to notice it for themselves so that they can describe it to you.
- *Encouraging communication.* Ask patients to verbalize what they perceive. Make statements such as “Tell me when you feel anxious” or “What is happening?” Patients should feel free to describe their perceptions to you, and you must try to see things as they seem to the patients.
- *Mirroring.* Restate what the patient has said to demonstrate that you understand.
- *Reflecting.* Encourage patients to think through and answer their own questions. A reflecting dialogue may go like this:

Patient: Do you think I should tell the doctor?

Medical Assistant: Do you think you should?

By reflecting patients’ questions or statements back to them, you are helping patients feel that their opinions about their health are of value.

- *Focusing.* Focusing encourages the patient to stay on the topic.
- *Exploring.* Encourage patients to express themselves in more depth. Try to get as much detail as possible about a patient’s complaint, but avoid probing and prying if the patient does not wish to discuss it.
- *Clarifying.* Ask patients to explain themselves more clearly if they provide information that is vague or not meaningful.
- *Summarizing.* This skill involves organizing and summing up the important points of the discussion. It gives the patient an awareness of the progress made toward greater understanding.

Ineffective Therapeutic Communication

Often, people think they are communicating thoroughly, but they are not. Here are some roadblocks that can interfere with your communication style:

- *Reassuring.* This type of communication indicates to the patient that there is no need for anxiety or worry. By doing this, you devalue the patient’s feelings and give false hope if the outcome is not positive. The communication error here is a lack of understanding and empathy.
- *Giving approval.* This is usually done by overtly approving of a patient’s behavior. This may lead the patient to strive for praise rather than progress.
- *Disapproving.* Overtly disapproving of a patient’s behavior implies that you have the right to pass judgment on the patient’s thoughts and actions. Find an alternate attitude when dealing with patients. Adopting a moralistic attitude may take your attention away from the patient’s needs and instead direct it toward your own feelings.
- *Agreeing/disagreeing.* Overtly agreeing or disagreeing with thoughts, perceptions, and ideas of patients is not an effective way to communicate. When you agree with patients, they will have the perception that they are right because you agree with them or because you share their opinion. Opinions and conclusions should be the patient’s, not yours. When disagreeing with patients, you become the opposition to them instead of their caregiver. Never place yourself in an argumentative situation regarding a patient’s opinions.
- *Advising.* If you tell the patient what you think should be done, you place yourself outside your scope of practice. You cannot advise patients.
- *Probing.* This means discussing a topic that the patient has no desire to discuss.
- *Defending.* Protecting yourself, the institution, and others from verbal attack is classified as defending. If you become defensive, the patient may feel the need to discontinue communication.

- *Requesting an explanation.* This communication pattern involves asking patients to provide reasons for their behavior. Patients may not know why they behave in a certain manner. “Why” questions may have an intimidating effect on some patients.
- *Minimizing feelings.* Never judge or make light of a patient’s discomfort. You need to be able to perceive what is taking place from the patient’s point of view, not your own.
- *Making stereotyped comments.* This type of communication involves using meaningless clichés—such as “It’s for your own good”—when communicating with patients. These types of comments are given in an automatic, mechanical way as a substitute for a more reasonable and thoughtful explanation.

Defense Mechanisms

When working with patients, it is important to observe their communication behaviors. Patients often develop unconscious defense mechanisms, or coping strategies, to protect themselves from anxiety, guilt, and shame. The following are some common defense mechanisms that a patient may display when communicating with the doctor, medical assistant, or other healthcare team members. These mechanisms may be adaptive (have the ability to change or adjust) or nonadaptive (not have the ability to change or adjust).

- *Compensation:* Overemphasizing a trait to make up for a perceived or actual failing
- *Denial:* An unconscious attempt to reject unacceptable feelings, needs, thoughts, wishes, or external reality factors
- *Displacement:* The unconscious transfer of unacceptable thoughts, feelings, or desires from the self to a more acceptable external substitute
- *Dissociation:* Disconnecting emotional significance from specific ideas or events
- *Identification:* Mimicking the behavior of another to cope with feelings of inadequacy
- *Introjection:* Adopting the unacceptable thoughts or feelings of others

POINTS ON PRACTICE

Communication and Scope of Practice

A medical assistant is a representative of the practice. However, patients may view you as a healthcare practitioner with medical decision-making ability. The physician or licensed practitioner will diagnose and prescribe treatment to a patient based on his or her examination and diagnostic test results. A medical assistant is not allowed to give his or her opinions on decisions made by the practitioner. Doing so puts a medical assistant in an “advising” position, which could cause legal complications for the practice. “Advising” is out of the scope of practice for a medical assistant and could be considered practicing medicine in most states, which is illegal.

- *Projection:* Projecting onto another person one’s own feelings, as if they had originated in the other person
- *Rationalization:* Justifying unacceptable behavior, thoughts, and feelings into tolerable behaviors
- *Regression:* Unconsciously returning to more infantile behaviors or thoughts
- *Repression:* Putting unpleasant thoughts, feelings, or events out of one’s mind
- *Substitution:* Unconsciously replacing an unreachable or unacceptable goal with another, more acceptable one

► Communicating in Special Circumstances

LO 4.6

If you make an effort to develop good interpersonal skills, most patients will not be difficult to communicate with. You will, however, encounter patients in special circumstances that can inhibit communication, such as when they are anxious or angry. Patients from different cultures may pose challenges to communication. Others may have some type of impairment or disability that makes communication difficult. Patients with terminal illnesses also may present communication difficulties. Learning about these patients’ special needs and polishing your own communication skills will help you become an effective communicator in any number of situations.

The Anxious Patient

It is not uncommon for patients to be anxious in a medical office or other healthcare setting. This reaction is commonly known as the white-coat syndrome. In some cases, the anxiety even raises the patient’s blood pressure. There can be many reasons for anxiety. A patient can become anxious because she is ill and does not know what is wrong with her—she may fear the worst. A patient may have recently been diagnosed with an illness that he knows nothing about, which may necessitate a severe lifestyle change. Fear of bad news or fear that some procedure is going to be painful can create anxiety. Regardless of what is causing it, anxiety can interfere with the communication process. For example, because of anxiety, a patient may not pay attention to what you are saying.

Some patients—particularly children—may be unable to verbalize their feelings of fear and anxiety. Watch for signs of anxiety, including a tense appearance, increased blood pressure and rates of breathing and pulse, sweaty palms, reported problems with sleep or appetite, irritability, and agitation. Procedure 4-1, at the end of this chapter, will help you communicate with anxious patients.

The Angry Patient

In a medical setting, anger may occur for many reasons. It may be a mask for fear about an illness or the outcome of surgery. Anger may come from a patient's feeling of being treated unfairly or without compassion, or it may stem from a patient's resentment about being ill or injured. Anger may also be a reaction to frustration, rejection, disappointment, feelings of loss of control or self-esteem, or an invasion of privacy.

As a medical assistant, you will encounter angry patients and will need to help them express their anger constructively, for the sake of their health. At the same time, you must learn not to take expressions of anger personally; you may just be the unlucky target. The goal with angry patients is to help them refocus emotional energy toward solving the problem. Procedure 4-2, at the end of this chapter, will help you communicate with angry patients. Remember to document the facts of each encounter and its outcome in the patient's medical record (see the progress note example from Cindy Chen's chart below).

Patients of Other Cultures

Our beliefs, attitudes, values, use of language, and world views are unique to us, but they are also shaped by our cultural background. Each culture and ethnic group has its own behaviors, traditions, and values. Rather than viewing these differences as communication barriers, strive to understand them (Figure 4-5). For example, many medical facilities are located in heavily populated ethnic locations,

and it is important that the medical staff understand the differences among patient cultures. A medical assistant who is employed in a medical facility in which the majority of patients are Latino should learn as much as possible about the specific Latin culture in that area in order to provide good customer service.

It is necessary to understand the difference between stereotyping and generalizing. *Stereotyping* is a negative statement about the specific traits of a group that is applied unfairly to an entire population. A *generalization* is a statement about common trends within a group, but it is understood that further investigation is needed to determine if the trend applies to an individual.

Remember, the beliefs of other cultures are neither superior nor inferior to your own. They are simply different. Never allow yourself to make value judgments or to stereotype a patient, a culture, or an ethnic group. Each patient is an individual in her own right and deserves your respect and undivided attention.

Cultural Differences Patients' cultural backgrounds have an effect on their attitudes, perceptions, behaviors, and expectations toward health and illness. The following are examples of cultural differences. More information can be found online at the National Institutes of Health website, <http://sis.nlm.nih.gov/outreach/multicultural.html>.

BWW **PROGRESS NOTE**

Patient Name:

This 28 y/o female came to office for follow up. Stated she was very nervous and requested "something to help calm me down, before I see the doctor." Became quite agitated when told Dr. Whalen would prescribe meds if needed. Encouraged her to tell me why she thought she was nervous and we talked about her schooling, exams, and her fear that her HIV status could make it difficult for her to find a position as a phlebotomist. She calmed down a bit, finally stating, "This feeling comes and goes. It is just a 'bad day.' Thank you for letting me talk." Informed Dr. Whalen of conversation.

Date:

FIGURE 4-5 Knowing how to communicate across cultures is an essential skill of medical assistants.

© Jose Luis Pelaez/Blend Images LLC RF

- Many cultures believe that some illnesses are caused by a change in the “vital energy” or hot and cold forces in the body.
- Certain cultures may differ in the way they perceive and report symptoms. Some may express pain very emotionally because their culture may feel that suppressing pain is harmful. In contrast, people from other cultures may not admit that they are in pain, thinking that acknowledging pain is a sign of weakness.
- Patients of certain ethnic or cultural groups often consult other types of healers before seeing a doctor. They are likely to have different expectations of treatment from each.
- Patients from other cultures may be wary of certain treatments because these treatments are so different from what they are accustomed to. This is especially true of some of the medical procedures and interventions considered to be state-of-the-art, such as laser surgery or diabetes management.
- In some cultures, it may not be appropriate to suggest making a will for dying patients or patients with terminal illnesses; this is the cultural equivalent of wishing death on a patient.
- Some cultures do not look those worthy of respect, such as healthcare workers, in the eye. If a patient does not look you in the eye when answering questions, it could be that in his culture he is not hiding anything but rather is showing you great respect.

Language Barriers Patients who cannot speak or understand English may have difficulty expressing their needs or feelings effectively. One of the first things you can do is use a family member who is present as an interpreter. However, federal policies require healthcare providers who receive federal funds (that is, Medicare) to make interpretive services available to their patients with limited English. The interpreter should be a medically trained interpreter, especially for patients having surgery or if a consent form needs to be signed. If your medical office has a large number of non-English speakers, it is a good idea to have forms translated and available for use. Procedure 4-3, Communicating with the Assistance of an Interpreter, at the end of this chapter will give you practice with this skill.

Limited Reading Skills You will find that some of your patients are functionally illiterate. They may try to hide this by saying, “I didn’t bring my glasses with me” or “This is too much to read right now.” Be polite, review the information with them, and ask if they have any questions. Send the information home and have them further discuss it with a family member before requesting that they sign consent forms or forms that need to be signed before having surgery. Several vendors publish patient education materials on a specific readability level. It is recommended that patient education brochures not exceed fourth- to eighth-grade reading levels. Visual media can be provided through valid Internet resources that will improve communication as well.

Cultural Competence Your cultural competence relates to your ability to respond to the cultural and language needs of

the patients you encounter. Consider the following techniques to improve your communication with patients of various cultures.

- If possible, learn and use a few phrases of greeting and introduction in the patient’s native language. This conveys respect and demonstrates your willingness to learn about their culture.
- Use an interpreter whenever needed to assist with communication. Look at the patient, not the interpreter, during communication.
- Be aware of nonverbal communication and respond. For example, look for signs of pain such as a grimace.
- Avoid saying “You must . . .” Instead, teach patients their options and let them decide—for example, “Some people in this situation would . . .”
- Always give the reason or purpose for a treatment or prescription.
- Make sure patients understand by having them explain it themselves.

The Patient Who Is Mentally or Emotionally Disturbed

There may be times when you will need to communicate with patients who are mentally or emotionally disturbed. When dealing with this type of patient, you need to determine what level of communication the patient can understand. Keep these suggestions in mind to improve communication.

- It is important to remain calm if the patient becomes agitated or confused.
- Avoid raising your voice or appearing impatient.
- If you do not understand what the patient said, ask him to repeat what he said.

Terminally Ill Patients

Terminally ill patients are often under extreme stress and can be a challenge to treat. It is important that healthcare professionals respect the rights of terminal patients and treat them with dignity. It is also important that you communicate with the family and offer support and empathy as their loved one accepts her condition. You also should provide information on **hospice**, which is an area of medicine that works with terminally ill patients and their families. Hospice workers often go to the home of the terminally ill patient or work with patients in facilities. Hospice care is usually staffed with RNs and other healthcare providers who have specialized training in issues related to death and dying. They work with the family and patient in the beginning, assisting with medications, comfort

care, and emotional support. If the patient dies at home, they may make arrangements with the funeral home and coroner.

Elisabeth Kübler-Ross, a world-renowned authority in the areas of death and dying, developed a model that describes the behavior patients will experience on learning their condition. This is called the stages of dying or stages of grief (Figure 4-6). This model is widely used in work with terminally ill patients.

Patients' Families and Friends

Family members or friends sometimes accompany a patient to the office. These individuals can provide important emotional support to the patient. Always ask patients if they want a family member or friend to accompany them to the examination room, however. Do not just assume their preference. Acknowledge family members and friends, and communicate with them as you do with patients. They should be kept informed of the patient's progress, whenever possible, to avoid unnecessary anxiety on their part. You must always protect patient confidentiality, however. Too often, healthcare workers think that it is acceptable to discuss patient cases in detail with family members, even without the patient's consent.

The Patient with AIDS and the Patient Who Is HIV-Positive

Patients with acquired immunodeficiency syndrome (AIDS) and patients who have the human immunodeficiency virus (HIV), the virus that causes AIDS, may face social stigma or blame themselves. These patients often feel guilty, angry, and depressed.

To communicate effectively with these patients, you need accurate information about the disease and the risks involved. Take the initiative to educate yourself about AIDS and HIV. Patients will have many questions. Part of your role as a good communicator will be to answer as many questions as you can. If a patient asks a question you cannot answer, tell the patient's provider so he can respond quickly.

Remember, HIV is not transmitted through casual or common physical contact, such as brushing by a person in a crowded hall or shaking hands. It is transferred only through body fluids. Patients with AIDS and those who are HIV-positive need to know you are not afraid to be near them, to touch them, or to talk to them. Like any patient whose body is being

Kübler-Ross's stages of dying include five stages, which usually—but not always—progress in the following order:

Even though these stages have been generalized to dying, many experts have applied them to the grieving process as well. For example, after a stroke, a patient may go through the process of grieving his loss of body function.

FIGURE 4-6 Kübler-Ross's stages of dying.

© ERproductions Ltd/Blend Images LLC RF

ravaged by a serious illness, these patients need human contact (verbal and physical) and they need to be treated with dignity.

► Communicating with Coworkers LO 4.7

The quality of the communication you have with coworkers greatly influences the development of a positive or negative work climate and a team approach to patient care. In turn, the workplace atmosphere ultimately affects your communication with patients.

Positive Communication with Coworkers

In your interactions with coworkers, use the same skills and qualities that you use to communicate with patients. Have respect and empathy; be caring, thoughtful, and genuine; and use active listening skills. These skills will help you develop **rappport**, which is a harmonious, positive relationship, with your coworkers. Following are some rules for communication in the medical office.

- Use proper channels of communication. For example, if you are having problems getting along with a coworker, try first to work it out with her. Do not go over her head and complain to her supervisor. Your coworker may not have realized the effect of her behavior and may wish to correct it without involving her supervisor. If you go to the supervisor right away, working relationships can become even more strained.
- Have the proper attitude. You can avoid conflict and resolve most problems if you maintain a positive attitude. A friendly approach is much more effective than a hostile approach. Remember, many problems are simply the result of misinformation or lack of communication.
- Plan an appropriate time for communication. If you have something important to discuss, schedule a time to do so. For example, if you want to talk with the office manager about renewing the lease on a piece of office equipment, tell him you would like to discuss that topic and ask him to let you know a time that is convenient.

As an example of good communication with coworkers, consider this exchange between Kaylyn, a clinical medical assistant, and Miguel, her coworker at BWW Associates. Note the way Kaylyn demonstrates assertiveness.

Kaylyn: I know you spent a lot of time choosing the new toys for the reception area. I love the wooden safari animal puzzles.

Miguel: Thanks. I think the children really enjoy themselves now.

Kaylyn: I wanted to mention to you, though, that I'm concerned about the toy tea set with miniature cupcakes and sandwiches. Anything that's smaller than a golf ball is a choking hazard to infants and toddlers.

Miguel: I don't think the little ones pay much attention to the tea set. It's mostly for older kids.

Kaylyn: Yes, but I'm still afraid that a baby could put one of those pieces in his mouth. What if we put up a little shelf in the play area that is low enough for kids 4 years old or more to reach but high enough to be out of reach of the babies? We could put the tea set on it in a clear plastic box and any other toys with small parts.

Miguel: I see your point. Sounds like a good idea to me.

Kaylyn started with a statement that acknowledged the coworker's situation and feelings. Then she stated her own opinion. When her coworker disagreed, she repeated her concern, describing what could happen if the situation remained unchanged. Then, she made a constructive suggestion for solving the problem without hurting the coworker's feelings. As you interact with coworkers, be sensitive to the timing of your conversations, the manner in which you present your ideas and thoughts, and your coworkers' feelings.

Communicating with Management

Positive or negative communication can affect the quality of your relationships with your supervisor or manager. For example, problems arise when communication about job responsibilities is unclear or when you feel that your supervisor does not trust or respect you, or vice versa. Consider these suggestions when communicating with your direct supervisor:

- Keep your supervisor informed. If the office copier is not working properly, talk to your supervisor about it before a breakdown occurs that will hold everyone up. If several patients express the same types of complaint about the examination rooms, make sure the right people are told. If the doctor asks you to call a patient and you reach the patient, tell the doctor.
- Ask questions. If you are unsure about an administrative task or the meaning of a medical term, for example, do not hesitate to ask your supervisor. It is better to ask a question before acting than to make a mistake. It is also better to ask than to risk annoying someone because you carried out a task or wrote a term incorrectly. Asking your supervisor or manager a question shows that you respect him or her professionally.
- Minimize interruptions. For example, before launching into a discussion, make sure your supervisor has time to talk. Opening with "Can I interrupt you for a moment, or should I come back?" or "Do you have a minute to talk?" goes a long way toward establishing good communication. It is also better to go to your supervisor when you have several questions to ask rather than to interrupt her repeatedly.
- Show initiative. Any manager or supervisor will greatly appreciate this quality. For example, if you think you can come up with a more efficient way to get the office

newsletter written and distributed, write out a plan and show it to your supervisor. He is likely to welcome any ideas that improve office efficiency or patient satisfaction.

Dealing with Conflict

Conflict, or friction, in the workplace can result from opposition of opinions or ideas or even from a difference in personalities. Conflict can arise when the lines of communication break down or when a misunderstanding occurs. Conflict also can result from preconceived notions about people or from lack of mutual respect or trust between a staff member and management. Whatever the cause, conflict is counterproductive to the efficiency of an office.

Following these suggestions can help prevent conflict in the office and improve communication among coworkers.

- Do not “feed into” other people’s negative attitudes. For example, if a coworker is criticizing one of the doctors, change the subject or walk away.
- Try your best at all times to be personable and supportive of coworkers. For example, everyone has bad days. If a coworker is having a bad day, offer to pitch in and help or to run out and get her lunch if she is too busy to go out.
- Refrain from judging or stereotyping others (women are bad at math, men do not know how to communicate, and so on). Coworkers should show respect for one another and try to be tolerant and nonjudgmental.

- Do not gossip. You are there to work. Act professionally at all times.
- Do not jump to conclusions. For example, if you get a memo about a change in your schedule that disturbs you, take your concern to your supervisor. She may be able to be flexible on certain points. You do not know until you ask.

Setting Boundaries in the Healthcare Environment

As a medical assistant, your professional behavior is extremely important. In many instances, when dealing with patients, physicians, and other staff members, you must set **boundaries**, whether physical or psychological. This will limit undesirable behavior.

If a patient, physician, or staff member is acting inappropriately toward you, you must take immediate action. Do not let the situation “fester.” You must act tactfully, assertively, and diplomatically. Let the aggressor know that his actions or language is inappropriate, and that you are not obligated in any way to accept such behavior. If none of your efforts help stop the unacceptable behavior, report the behavior to your immediate supervisor so she can assist you in identifying a solution. If the aggressor is your immediate supervisor, follow the office policy and procedure. Make yourself aware of policy and procedures ahead of time by reading the policy and procedure manual, which will be discussed in the *Practice Management* chapter.

PROCEDURE 4-1 Communicating with the Anxious Patient

WORK // DOC

Procedure Goal: To use communication and interpersonal skills to calm an anxious patient

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Progress note

Method:

1. Identify signs of anxiety in the patient.
2. Acknowledge the patient’s anxiety. (Ignoring a patient’s anxiety often makes it worse.)

RATIONALE: *Good therapeutic communication techniques can help reduce patient anxiety.*

3. Identify possible sources of anxiety, such as fear of a procedure or test result, along with supportive resources available to the patient, such as family members and friends.

RATIONALE: *Understanding the source of anxiety in a patient and identifying the supportive resources available can help you communicate with the patient more effectively.*

4. Do what you can to alleviate the patient’s physical discomfort. For example, find a calm, quiet place for the

patient to wait, a comfortable chair, a drink of water, or access to the bathroom.

5. Allow ample personal space for conversation. Note: You would normally allow a 1- to 4-foot distance between yourself and the patient. Adjust this space as necessary.
6. Create a climate of warmth, acceptance, and trust.
 - a. Recognize and control your own anxiety. Your air of calm can decrease the patient’s anxiety.
 - b. Provide reassurance by demonstrating genuine care, respect, and empathy.
 - c. Act confidently and dependably, maintaining truthfulness and confidentiality at all times.
7. Using the appropriate communication skills, have the patient describe the experience that is causing anxiety, her thoughts about it, and her feelings. Proceeding in this order allows the patient to describe what is causing the anxiety and to clarify her thoughts and feelings about it.
 - a. Maintain an open posture.
 - b. Maintain eye contact, if culturally appropriate.

c. Use active listening skills.

d. Listen without interrupting.

RATIONALE: *The use of open-ended questioning will result in more information about the patient's feelings of anxiety.*

8. Do not belittle the patient's thoughts and feelings. This can cause a breakdown in communication, increase anxiety, and make the patient feel isolated.

9. Be empathic to the patient's concerns.

10. Help the patient recognize and cope with the anxiety.

a. Provide information to the patient. Patients are often fearful of the unknown.

b. Suggest coping behaviors, such as deep breathing or other relaxation exercises.

RATIONALE: *Helping them understand their disease or the procedure they are about to undergo will help decrease their anxiety.*

11. Notify the doctor of the patient's concerns.

RATIONALE: *The physician must be aware of all aspects of the patient's health, including anxiety, to allow for optimal patient care. Part of your job as a medical assistant is to act as a liaison between the patient and the physician.*

12. Document your encounter with the patient.

PROCEDURE 4-2 Communicating with the Angry Patient **WORK // DOC**

Procedure Goal: To use communication and interpersonal skills to calm an angry patient

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Progress note

Method:

1. Recognize anger and its causes. Anger is easy to recognize in most people, but it can be subtle in others. Patients who speak in a tense tone, are stubborn, or appear to ignore your attempts at communication may be angry.

2. Remain calm and continue to demonstrate genuineness and respect. Communicate that you respect and care about the patient's feelings.

3. Focus on the patient's physical and medical needs.

4. Maintain adequate personal space. Place yourself on the same level as the patient. If the patient is standing, encourage him to sit down. Maintain an open posture and eye contact but avoid staring.

RATIONALE: *Open posture and eye contact show the patient you are receptive to listening. Staring at the patient may make the person angrier.*

5. Listen attentively and with an open mind to what the patient is saying. Avoid the feeling that you need to defend yourself or to give reasons the patient should not be angry.

RATIONALE: *Most patients' anger will lessen if they know someone is really listening to them and showing an interest in their emotions and needs.*

6. Encourage patients to be specific in describing the cause of their anger, their thoughts about it, and their feelings. Be empathic and acknowledge the patient's feelings and perceptions. Follow through with any promises you make concerning correction of a problem, but avoid totally agreeing or disagreeing with the patient. State what you can and cannot do for the patient.

7. Present your point of view calmly and firmly to help the patient better understand the situation. If patients are receptive to your viewpoint, their perspective may change for the better.

8. Avoid a breakdown in communication. Allow the patient to voice anger. Trying to outtalk the patient or overexplain will only annoy and irritate him. If needed, suggest that the patient spend a few moments alone to gather his thoughts or to cool off before continuing any type of communication.

9. If you feel threatened by a patient's anger or if it looks as if the patient's anger may become violent, leave the room and seek assistance from one of the physicians or other members of the office staff.

10. Document any actual threats in the patient's chart.

PROCEDURE 4-3 Communicating with the Assistance of an Interpreter **WORK // DOC**

Procedure Goal: To demonstrate techniques to effectively communicate with a non-English-speaking patient through an interpreter

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials:

Pen, forms, progress note, or computer and appropriate pictures and other visual aids if available

Method:

1. Identify the patient by name and ask if you pronounced the name correctly. Be sure to smile, even if you are feeling slightly awkward or unsure of yourself.

RATIONALE: *A smile is a form of nonverbal communication that will help the patient feel more comfortable.*

2. Introduce yourself, with your title, to the patient and the interpreter.

3. Ask the interpreter to spell his full name and provide you with identification, such as his agency's identification or a business card. Retain his business card to file in the patient's medical record. If he does not have a business card, obtain contact information, which also will be filed in the patient's medical record.

RATIONALE: *Healthcare facilities are required to provide an interpreter, and this information must be documented.*

4. Do not take it personally if the patient appears abrupt or even rude; this behavior may be considered appropriate in the patient's culture. For example, in some cultures, male patients may not deal with a female staff member, and that should be respected if possible. Ascertain from the interpreter if there is a problem.
5. Inquire of the interpreter if the patient speaks or understands any English and if there are any communication traditions or other customs that you should be aware of. For example, traditional Navajo people consider it rude to have direct eye contact.
6. Provide a quiet, comfortable area.
7. Speak directly to the patient, and speak slowly if the patient has any understanding of English.

RATIONALE: *Eye contact and other forms of nonverbal communication are important to convey and receive information.*

8. If forms are to be completed, instruct the interpreter to translate with appropriate intervals and give opportunities for the patient to ask questions to ensure understanding. For example, if the patient is providing general consent for treatment or permission to send information and receive payment directly from the insurance company, have one area translated at a time. Instruct the interpreter to ask if there are questions at each portion.
9. If the patient and interpreter are discussing an issue in depth or appear to be leaving you out of the conversation, ask the translator what is being said.
10. Provide the same information, services, and courtesies that you would to a native English speaker. If possible, provide written information in the patient's native language.
11. Document what you would ordinarily document; note on all forms that "translation was done by" and include the name, credential, and agency of the interpreter, as well as the date and time.

S U M M A R Y O F L E A R N I N G O U T C O M E S	
LEARNING OUTCOMES	KEY POINTS
4.1 Identify elements and types of communication.	The communication circle involves a message being sent, a source, and a receiver that responds. Feedback is the response to a message, and noise is anything that may interfere with or change the message.
4.2 Relate communication to human behavior and needs.	Understanding human behavior and needs, and their correlation with professional relationships, is necessary to practicing as a medical assistant. Understanding the various stages of human life assists you in your communication skills with patients.
4.3 Categorize positive and negative communication.	Communication that promotes comfort and well-being is considered positive communication. Negative communication can be a turnoff. Medical assistants may not be aware of some of the signs of negative communication they display. Lack of eye contact with patients, except in specific cultures, or speaking sharply to a patient is considered negative communication. To help you avoid this type of communication, ask yourself, "Does this make me feel good?" or "Do I feel welcome?"
4.4 Model ways to improve listening, interpersonal skills, and assertiveness skills.	Listening and other interpersonal skills can be improved by becoming more involved in the communication process by offering feedback or asking questions of the patient. Assertive medical assistants trust their instincts. They respect their self-worth, while still making the patient feel comfortable and important. Aggressive medical assistants try to impose their positions through manipulation techniques.

LEARNING OUTCOMES

KEY POINTS

4.5 Carry out therapeutic communication skills.	Therapeutic communication is the ability to communicate with patients in terms that they can understand and, at the same time, feel at ease and comfortable in what you are saying. Positive therapeutic skills can enhance communication. Be aware of negative therapeutic skills that can disrupt the communication. Recognize defense mechanisms in patients and note whether the patient is using them to cope or is not able to cope.
4.6 Use effective communication strategies with patients in special circumstances.	Learning about the special needs of patients and polishing your communication skills will help you become an effective communicator. This will help you handle diversity in the workplace, handle anxious and annoyed patients, and deal with patients who have language barriers.
4.7 Carry out positive communication with coworkers and management.	The quality of communication you have with your coworkers and your supervisor greatly influences the development of a positive or negative work climate. Use proper channels of communication. Be open-minded. Keep supervisors informed of office problems as they arise and show initiative in your work habits.

CASE STUDY CRITICAL THINKING

© Red Chopsticks/Getty Images RF

Recall Cindy Chen from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding her case.

1. Cindy Chen is nervous. What techniques could you use to improve your communication with her?
2. What should you do regarding Cindy Chen's HIV-positive health status?
3. How would you best answer Ms. Chen's question "Do you have anything you can give me until I see the doctor?"
4. Ms. Chen becomes agitated when you answer her question. What should you do?

EXAM PREPARATION QUESTIONS

1. (LO 4.1) The main elements in the communication circle are
 - a. A message (verbal and nonverbal), a source, and a receiver
 - b. A message and a receiver
 - c. A receiver, a response, a sender, and a source
 - d. A source, feedback, and a receiver (verbal and nonverbal)
 - e. A message, a receiver, and a response
2. (LO 4.7) Good relationships with coworkers would not include
 - a. Professionalism
 - b. Stress
 - c. Cooperation
 - d. Gossip
 - e. Integrity
3. (LO 4.3) Which is an example of negative communication?
 - a. Speaking sharply to the patient
 - b. Listening carefully
 - c. Being friendly and warm
 - d. Looking directly at the patient
 - e. Keeping quiet when appropriate
4. (LO 4.1) Which of the following is an example of positive communication?
 - a. Treating patients impersonally
 - b. Looking directly at patients when you speak to them
 - c. Speaking brusquely or sharply
 - d. Showing boredom
 - e. Forgetting common courtesies, such as saying please and thank you

5. (LO 4.4) The ability to identify with someone else's feelings is called
 - a. Sympathy
 - b. Feedback
 - c. Empathy
 - d. Respect
 - e. Assertiveness
6. (LO 4.3) Poor communication could lead to all of the following *except*
 - a. Patient satisfaction
 - b. Errors in billing
 - c. Inefficient care
 - d. Malpractice
 - e. Anxiety
7. (LO 4.3) Personal space in a healthcare environment is approximately
 - a. 7–18 feet
 - b. 1–4 feet
 - c. 3–6 feet
 - d. 4–12 feet
 - e. 3–10 feet
8. (LO 4.3) You want to convey an open posture while communicating with a patient. What should you do?
 - a. Fold your arms and lean forward while looking into the patient's eyes
 - b. Lean back gently while facing the patient
 - c. Lean forward in your chair facing the patient
 - d. Lean forward and avoid eye contact with the patient
 - e. Extend your arms while leaning forward toward the patient
9. (LO 4.6) Your patient has been diagnosed with a terminal illness and makes the following comment: "If you could help me make it to my grandson's graduation next month before I get too sick, that would be perfect." Which of Kübler-Ross's stages of dying is this patient exhibiting?
 - a. Denial
 - b. Bargaining
 - c. Depression
 - d. Acceptance
 - e. Anger
10. (LO 4.6) Which of the following is a proper technique for demonstrating cultural competence?
 - a. Avoid giving the reason or purpose for a treatment or prescription, since they will not understand
 - b. Do not speak in the patients' native language, because it may make them uncomfortable
 - c. Look at the interpreter during communication to ensure he or she is making the correct statement
 - d. Avoid saying, "You must . . ."; instead, teach patients their options and let them decide—for example, "Some people in this situation would . . ."
 - e. Ignore nonverbal communication, since it is difficult to interpret

SOFT SKILLS SUCCESS

Hunter Glaspell, a 67-year-old male patient, calls BWW Medical Associates, stating his ear has been bothering him for days and the pain is getting worse. It is Monday afternoon at 4 P.M. The schedule is packed, and he wants to come in right away. When you offer him an appointment at 9 A.M. tomorrow, he becomes verbally abusive,

screaming that he is in pain now. How will you handle this situation?

CASE STUDY

PATIENT INFORMATION	Patient Name	DOB	Allergies
	Cindy Chen	7/15/XX	NKA
PATIENT INFORMATION	Attending	MRN	Other Information
	Alexis N. Whalen, MD	324-86-542	Finishes school in 6 months

Cindy Chen, a 28-year-old female complaining of inability to sleep and nervousness, arrives at the office. She tested positive for HIV in 2014, although she has been asymptomatic on antiviral drugs. Currently, she lives with her aunt and is going to school to become a phlebotomist. As you

© Red Chopsticks/Getty Images RF

are preparing to bring Cindy in from the reception area, the externship student, who is new to the office, states that she is afraid to work with you when caring for Cindy because she is afraid she might get AIDS if she works closely with her.

Keep Cindy in mind as you study the chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

ACTIVSim

LEARNING OUTCOMES

After completing Chapter 5, you will be able to:

- 5.1 Differentiate between laws and ethics.
- 5.2 Identify the responsibilities of the patient and physician in a physician-patient contract, including the components for informed consent that must be understood by the patient.
- 5.3 Describe the four Ds of negligence required to prove malpractice and explain the four Cs of malpractice prevention.
- 5.4 Relate the term *credentialing* and explain the importance of the FDA and DEA to administrative procedures performed by medical assistants.
- 5.5 Summarize the purpose of the following federal healthcare regulations: HCQIA, False Claims Act, OSHA, and HIPAA.
- 5.6 Identify the six principles for preventing improper release of information from the medical office.
- 5.7 Discuss the importance of ethics in the medical office.
- 5.8 Explain the differences among the practice management models.

KEY TERMS

- | | |
|---------------------------|--------------------|
| abandonment | ethics |
| assault | expressed contract |
| battery | felony |
| bioethics | fraud |
| breach of contract | implied contract |
| civil law | law |
| consent | locum tenens |
| contract | minors |
| criminal law | misdemeanor |
| deposition | negligence |
| durable power of attorney | tort |

- VIII.C.5** Differentiate between fraud and abuse
- X.C.1** Differentiate between scope of practice and standards of care for medical assistants
- X.C.4** Summarize the Patient Bill of Rights
- X.C.6** Compare criminal and civil law as they apply to the practicing medical assistant
- X.C.7** Define:
- (a) negligence
 - (b) malpractice
 - (c) statute of limitations
 - (d) Good Samaritan Act(s)
 - (e) Uniform Anatomical Gift Act
 - (f) living will/advanced directives
 - (g) medical durable power of attorney
 - (h) Patient Self Determination Act (PSDA)
- X.C.10** Identify:
- (b) Genetic Information Nondiscrimination Act of 2008 (GINA)
- X.C.11** Describe the process in compliance reporting:
- (c) conflicts of interest
- X.C.13** Define the following medical legal terms:
- (a) informed consent
 - (b) implied consent
 - (c) expressed consent
 - (d) patient incompetence
 - (e) emancipated minor
 - (f) mature minor
 - (g) subpoena duces tecum
 - (h) respondeat superior
 - (i) res ipsa loquitur
 - (j) locum tenens
 - (k) defendant-plaintiff
 - (l) deposition
 - (m) arbitration-mediation
- XI.C.1** Define:
- (a) ethics
 - (b) morals
- XI.C.2** Differentiate between personal and professional ethics
- XI.P.1** Develop a plan for separation of personal and professional ethics
- XI.A.1** Recognize the impact personal ethics and morals have on the delivery of healthcare

4. Medical Law and Ethics

- b. Institute federal and state guidelines when releasing medical records or information
- c. Follow established policies when initiating or terminating medical treatment
- d. Understand the importance of maintaining liability coverage once employed in the industry
- e. Perform risk management procedures
- f. Comply with federal, state, and local health laws and regulations as they apply to healthcare settings

► Introduction

Medical law plays an important role in medical facility procedures and the quality of patient care. Our modern society can be a litigious one, meaning people are inclined to sue when results or outcomes are not acceptable to them. This

is particularly true with healthcare practitioners, healthcare facilities, and manufacturers of medical equipment and products. Patients, their relatives, and others expect favorable medical outcomes and often sue when these outcomes do not meet expectations. As a result, it is important for all medical professionals to understand medical law, ethics, and the Health

Insurance Portability and Accountability Act (HIPAA), which began in 1996 and has expanded since that time.

As a medical assistant, having a basic knowledge of medical law and ethics can help you gain perspective in the following three areas:

1. *The rights, responsibilities, and concerns of healthcare consumers.* Healthcare professionals need to be concerned about how law and ethics impact their respective professions and they must understand how legal and ethical issues affect patients. As medical technology advances and the use of computers increases, patients know more about their healthcare options and their rights as consumers, and more about the responsibilities of healthcare practitioners to their patients.
2. *The legal and ethical issues facing society, patients, and healthcare professionals as the world changes.* Every day new technologies emerge with solutions to biological and medical issues. These solutions often include social issues involving decisions about controversial topics like reproductive rights, fetal stem cell research, and confidentiality with sensitive medical records.
3. *The impact of rising costs on the laws and ethics of healthcare delivery.* Rising costs—of both healthcare insurance and medical treatment in general—can lead to questions concerning access to healthcare services and the allocation of medical treatment. For example, should everyone, regardless of age, race, or lifestyle, have the same access to scarce medical commodities like transplant organs and very expensive medications?

Because medical treatment and decisions surrounding healthcare today have become so increasingly complex, it is important to be knowledgeable about, and aware of, the ethical issues and the laws that govern patient care. As a medical assistant and an important member of the healthcare team, always keep in mind that any health or financial information you obtain regarding a patient (past or present) is protected. It may be shared only with the patient's express permission, except in a few very specific instances, which will be discussed in this chapter.

► Laws and Ethics

LO 5.1

In order to understand medical law and ethics, it is helpful to know the difference between law and ethics. A **law** is defined as a rule of conduct or action prescribed or formally recognized as binding or enforced by a controlling authority, such as local, state, and federal governments. **Ethics** is a standard of behavior based on concepts of right and wrong. Ethical behavior goes beyond the legal consideration in any given situation. *Moral values*—formed through the influence of family, culture, and society—serve as a basis for ethical conduct. Ethics will be discussed in further detail later in the chapter.

Classifications of Law

While a crime is any offense committed or omitted in violation of a public law, two types of law pertain to healthcare

practitioners: criminal law and civil law. Whether the case is criminal or civil, there are always two sides, the plaintiff and the defendant. The party making the charge or claim is known as the *plaintiff*. The party against whom the charge or claim is made is the *defendant*.

Criminal Law Criminal law involves crimes against the state. When a state or federal law is violated, the government brings criminal charges against the alleged offender—for example, *Ohio v. John Doe*. Criminal laws prohibit such crimes as murder, arson, rape, and burglary. A criminal act may be classified as a felony or a misdemeanor. A **felony** is a crime punishable by death or by imprisonment in a state or federal prison for more than 1 year. Some examples of a felony include abuse (child, elder, or domestic violence), manslaughter, fraud, attempted murder, and practicing medicine without a license.

Misdemeanors are less serious crimes than felonies and are punishable by fines or imprisonment in a facility other than a federal prison for 1 year or less. Some examples of misdemeanors are thefts under a certain dollar amount, attempted burglary, and disturbing the peace.

Civil Law Civil law involves crimes against the person. Under civil law, a person can sue another person, a business, or the government. Court judgments in civil cases often require the payment of a sum of money to the injured party. Civil law includes a general category of law known as torts. A **tort** is broadly defined as a civil wrong committed against a person or property that causes physical injury or damage to someone's property or that deprives someone of his or her personal liberty and freedom. Torts may be intentional (willful) or unintentional (accidental).

Intentional Torts When one person intentionally harms another, the law allows the injured party to seek a remedy in a civil suit. The injured party can be financially compensated for any harm done by the person guilty of committing the tort. If the conduct is judged to be malicious, punitive damages may also be awarded. Examples of intentional torts include the following:

- **Assault** is the open threat of bodily harm to another, or acting in such a way as to put another in the "reasonable apprehension of bodily harm." In the medical office, if a patient were to feel threatened in any way, assault could be charged.
- **Battery** is an action that causes bodily harm to another. It is broadly defined as any bodily contact made without permission. In healthcare delivery, battery may be charged for any unauthorized touching of a patient, including such actions as suturing a wound, administering an injection, or performing a physical examination. For this reason, having a written record of a patient's informed consent is essential for all invasive medical procedures. Informed consent is discussed later in this chapter.
- **Defamation** is the act of damaging a person's reputation by making public statements that are both false and malicious.

The full term for these actions is *defamation of character*. Defamation can take the form of slander and/or libel. *Slander* is speaking damaging words intended to negatively influence others against an individual in a manner that jeopardizes his or her reputation or means of livelihood. If a patient hears members of the staff speaking about him in an unprofessional manner, or talking about his diagnosis with staff members without a “need to know,” it could be considered slanderous. *Libel* is publishing in print damaging words, pictures, or signed statements that will injure the reputation of another.

- False imprisonment is the intentional, unlawful restraint or confinement of one person by another. Preventing a patient from leaving the facility might be seen as false imprisonment.
- *Healthcare fraud* and *abuse* are closely related intentional torts. **Fraud** is an intentional deception or misrepresentation of services that an individual knows to be false and that could result in an unauthorized reimbursement to a practice. An example of healthcare fraud would be billing for a procedure that is not performed. *Abuse* describes incidents or practices inconsistent with accepted and sound medical, business, or fiscal practices. Billing for unnecessary medical services is an example of healthcare abuse.
- Invasion of privacy is the interference with a person’s right to keep personal matters private. Entering an exam room without knocking can be considered an invasion of privacy. The improper use of or a breach of confidentiality of medical records may be seen as an invasion of privacy.

Unintentional Torts The most common torts within the healthcare delivery system are those committed unintentionally. Unintentional torts are acts that are not intended to cause harm but are committed unreasonably or with a disregard for the consequences. In legal terms, such acts constitute negligence. **Negligence** is charged when a healthcare practitioner fails to exercise ordinary care and the patient is injured. Medical negligence is more commonly known as malpractice, which will be discussed in more detail later in this chapter.

Contracts

A **contract** is a voluntary agreement between two parties in which specific promises are made for a consideration. The elements of a contract are important to healthcare practitioners because healthcare delivery takes place under various types of contracts. To be legally binding, four elements must be present in a contract:

1. **Agreement.** One party makes an offer and another party accepts it. Certain conditions pertain to the offer:
 - It can relate to the present or the future.
 - It must be communicated.
 - It must be made in good faith and not under duress or as a joke.

- It must be clear enough to be understood by both parties.
- It must define what both parties will do if the offer is accepted.

For example, a physician offers a service to the public by obtaining a license to practice medicine and opening a business. Patients accept the physician’s offer by scheduling appointments, submitting to physical examinations, and allowing the physician to prescribe or perform medical treatment. The contract is complete when the physician’s fee is paid.

2. **Consideration.** Something of value is bargained for as part of the agreement. The physician’s consideration is providing service; the patient’s consideration is payment of the physician’s fee.
3. **Legal subject matter.** Contracts are not valid and enforceable in court unless they are for legal services or purposes. For example, a contract entered into by a patient to pay for the services of a physician in private practice would be *void* (not legally enforceable) if the physician were not licensed to practice medicine. **Breach of contract** may be charged if either party fails to comply with the terms of a legally valid contract.
4. **Contractual capacity.** Parties who enter into the agreement must be capable of fully understanding all its terms and conditions. For example, a mentally incompetent individual or a person under the influence of drugs or alcohol cannot enter into a contract. In this context, *incompetent patients* are those who have mental conditions that make them incapable of understanding the concepts and meaning of a contract.

Types of Contracts The two main types of contracts are expressed contracts and implied contracts. An **expressed contract** is clearly stated in written or spoken words. A payment contract is an example of an expressed contract. **Implied contracts** are those in which the conduct of the parties, rather than expressed words, indicates acceptance and creates the contract. A patient who rolls up a sleeve and offers an arm for an injection is creating an implied contract.

Employment Contract Some medical practices—usually larger practices and hospitals—use employment contracts for their employees. This type of contract could include any or all of the following elements:

- A description of your duties and your employer’s duties
- Plans for handling major changes in job responsibilities
- Salary, bonuses, and other forms of compensation
- Benefits, like vacation time, sick days, life insurance, and participation in pension plans
- Grievance procedures
- Exceptional situations under which the contract may be terminated by either you or your employer
- Termination procedures and compensation
- Special provisions, like job sharing, medical examinations, or liability coverage

If you are offered an employment contract, study it closely. Consider any local laws that apply. It is wise to have a lawyer or business adviser review the contract prior to signing it.

► The Physician-Patient Contract LO 5.2

A physician has the right, after forming a contract or agreeing to accept a patient under his or her care, to make reasonable limitations (such as expecting the patient to follow through on the agreed-upon treatment plan) on the contractual relationship. The physician is under no legal obligations to treat patients who may wish to exceed those limitations (for example, expecting the physician to accept patient phone calls at home). Under the physician-patient contract, both parties have certain rights and responsibilities.

Physician Rights and Responsibilities

A physician has the right to

- Set up a practice within the boundaries of his or her license to practice medicine.
- Set up an office where he or she chooses and to establish office hours.
- Specialize.
- Decide which services he or she will provide and how those services will be provided.

Within an implied contract, the physician is not expected, or bound, to

- Treat every patient seeking care. A physician is free to use his or her discretion to form contracts within his or her practice, with one exception: If a physician is providing care to patients in a hospital emergency room or free clinic, then the physician must treat every patient who comes for treatment.
- Restore the patient to his or her original state of health.
- Make a correct diagnosis in every case.
- Guarantee the successful result of any treatment or operation. In fact, guarantees of “cures” may constitute fraud on the part of the physician.

Under an implied contract with the patient, the physician does have the responsibility (obligation) to

- Use due care, skill, judgment, and diligence in treating patients, with the same care, skill, judgment, and diligence that peers of the same medical specialty use.
- Stay informed of the best (and current) methods of diagnosis and treatment.
- Perform to the best of his or her ability, whether or not he or she is to receive a fee.
- Furnish complete information and instructions to the patient about diagnoses, options, methods of treatment, and fees for services.

Medical Assistants and Liability All competent adults are liable (legally responsible) for their actions, in

both their personal lives and their professional careers. As a medical assistant, it is important to know and understand your scope of practice within the state where you are working. As healthcare providers, medical assistants have general liability in the duties they perform, as well as toward the facility in which they work. By understanding the standard of care and the duty of care, you, as the office medical assistant, can function ethically and legally within the scope of practice for your profession. Medical assistants are held to the “reasonable person standard,” which means to carry out your professional and interpersonal relationships without causing harm. This also means that you are held to a higher standard, both inside and *outside* of the office and both during and *outside* of office hours.

Patient Rights and Responsibilities

Each patient has the right to see the physician of the individual’s choosing, although some managed care plans limit the physician choices to those that are “in-network.” Patients also have the right to terminate a physician’s services if they wish. Most states have adopted a version of the American Hospital Association’s *patient care partnership* (formerly called the Patient’s Bill of Rights). The patient care partnership is a list of standards that patients can expect in healthcare. The Joint Commission (TJC) requires hospitals to post a copy of these standards, and most managed care organizations require contracted physicians to post them. Figure 5-1 is an example of a typical patient care partnership list for a medical office. The brochure given to the patient would go into each point in more detail.

Patient Responsibilities Patients are also part of the medical team involved in their treatment. Under an implied contract, patients have the responsibility to

- Follow any instructions given by the licensed practitioner and cooperate as much as possible.
- Give all relevant information to the licensed practitioner in order to reach a correct diagnosis. If a patient fails to inform a licensed practitioner of any medical conditions he or she has and an incorrect diagnosis is made, the licensed practitioner is not liable.
- Follow the licensed practitioner’s orders for treatment.
- Pay the fees charged for services provided.

Consent means that the patient has given permission, either expressed or implied, for the licensed practitioner to examine him or her, to perform tests that aid in reaching a diagnosis, or to treat a known or found medical condition. *Expressed consent* is consent the patient gives in words. When the patient makes an appointment to be examined by a licensed practitioner, the patient has given *implied consent* to the examination and any (simple) diagnostic testing procedures needed for treatment.

Informed consent involves the patient’s right to receive all information relative to his or her condition and to make a decision regarding treatment based upon that knowledge. The “doctrine of informed consent” is the legal basis for informed

Patient Care Partnership Understanding Expectations, Rights, and Responsibilities

Welcome to our medical practice. As our patient, you have the right to certain expectations, including

1. High-quality medical care.
2. A clean and safe environment for your medical care.
3. Informed involvement in your medical care.
4. Protection of your privacy.
5. Assistance obtaining referrals and appointments with outside providers.
6. Help with billing and insurance claim issues.

You will receive a brochure outlining the details of these rights for your records. If you have any questions, comments, concerns, or suggestions regarding the information within the brochure or regarding your care with us, please let us know. We are always interested in improving your patient care experience with us.

FIGURE 5-1 Example of a patient care partnership list.

consent (or informed refusal of treatment) and is usually outlined in a state's medical practice acts. Informed consent implies that the patient understands

- Proposed treatment modes.
- Why the treatment is necessary.
- The risks involved in the proposed treatment.
- Available alternative modes of treatment.
- The risks of alternative treatments.
- The risks involved if treatment is refused.

Adult patients who are of sound mind are usually able to give informed consent. Courts have ruled that emancipated minors (those under age 18, not living at home, and self-supporting) understand as a competent adult would and therefore are able to make decisions on their own. Mature minors—although defined differently by each state—are generally minors who, depending on their medical condition, are considered capable of making their own medical decisions and do not require a guardian's consent for certain procedures like contraception, sexually transmitted infection (STI) treatment, and drug or alcohol addictions. Keep in mind, however, that although mature minors may consent to treatment, they

may not legally be allowed to enter into a financial contract for payment. The physician or business manager should make decisions regarding payment issues surrounding treatment of mature minors.

Patients who cannot give informed consent include the following:

- **Minors** or persons under the age of majority, but excluding married minors
- The mentally incompetent
- Those who speak a foreign language—interpreters may be necessary

Informed consent is a vital part of the practice of medicine. Physicians are often sued for negligence because of the failure to adequately inform patients of adverse surgical complications, drug reactions, and alternative treatment modes.

Terminating the Physician-Patient Contract

There are times when a physician feels it is necessary to terminate care of a patient. Terminating care is sometimes called withdrawing from a case and must be undertaken very

carefully to avoid charges of abandonment. The following are some typical reasons a physician may choose to withdraw from a case:

- The patient refuses to follow the physician's instructions.
- The patient's family members complain incessantly to or about the physician.
- A personality conflict develops between the physician and the patient that cannot be reasonably resolved.
- The patient habitually does not pay for or fails to make satisfactory arrangements to pay for medical services. A physician may stop treatment of such a patient and end the physician-patient relationship only if adequate notice is given to the patient.
- The patient fails to keep scheduled appointments. To protect the physician from charges of abandonment, all missed and canceled appointments should be noted in the patient's chart.

A physician who terminates care of a patient must do so in a formal, legal manner, following these four steps.

1. Write a letter to the patient, expressing the reason for withdrawing from the case and recommending that the patient seek medical care from another physician as soon as possible. Thirty days is the usual norm allowed for finding another physician. Figure 5-2 shows an example of a letter terminating patient care.
2. Send the letter by certified mail with a return receipt requested. This will provide evidence that the patient received the notification by providing a signature on the return receipt.
3. Place a copy of the letter (and the return receipt, when received) in the patient's medical record.
4. Summarize in the patient record the physician's reason for terminating care and the actions taken to inform the patient.

Just as a physician may choose to end the physician-patient contract, a patient also may choose to end this contract at any time. Often, the ending of the contract on the patient's part is much less formal; he may simply stop coming to appointments. If a patient suddenly stops coming to appointments, as a medical assistant, you should always attempt

FIGURE 5-2 Sample letter of withdrawal of medical care.

to reach the patient to ascertain the reason the patient has stopped coming to the office. If the patient expresses dissatisfaction with the care he has received, inform the physician as soon as possible and document the call in the patient's medical record. You will have a look at patient dissatisfaction and its connection with malpractice claims a little later in this chapter.

Standard of Care

As a medical assistant, you are expected to fulfill the standards of the medical assisting profession by practicing appropriate legal concepts for your profession. According to the AAMA, medical assistants should uphold legal concepts in the following ways:

- Maintain confidentiality
- Practice within the scope of training and capabilities
- Prepare and maintain medical records
- Document accurately
- Use appropriate guidelines when releasing information
- Follow legal guidelines and maintain awareness of health-care legislation and regulations
- Maintain and dispose of regulated substances in compliance with government guidelines
- Follow established risk management and safety procedures
- Meet the requirements for professional credentialing

Some state laws dictate what medical assistants may or may not do. For instance, in some states it is illegal for medical assistants to give injections to patients. No states consider it legal for medical assistants to diagnose a condition, prescribe treatment, or allow a patient to believe that the medical assistant is a nurse. In addition to what is stated by law, you and the physician must establish your scope of practice—the procedures that are appropriate for you to perform while working under the physician's supervision. Once that scope of practice is agreed upon, you must continue to stay within that scope of practice unless the scope is updated or changed by mutual agreement. For instance, your scope of practice may change if laws change in your state or if you receive additional training, increasing your skill and/or credential level, which allows an increase in responsibilities for your position.

Closing a Medical Practice

Distressful economic circumstances may cause a medical practice to terminate and close its services to its patients. If this becomes necessary, make sure the medical staff and all physicians do the following:

- Comply with all HIPAA laws for maintaining confidentiality
- Write letters to all patients, giving them knowledge that your practice will be closing (Figure 5-3)
- Give patients an option of choosing another physician, or make referrals. If the patient chooses another physician to take over his care, get written consent for his charts to be transferred to that physician properly.

- Keep all files in a secured location for the maximum amount of time files should be saved if contact with patients cannot be made. You will have to choose a vendor that stores files; make sure you choose a reputable vendor.
- Shred files if necessary; again, be sure to choose reputable vendors
- Stay up-to-date on any HIPAA laws that will affect the practice

▶ Preventing Malpractice Claims LO 5.3

Malpractice litigation not only adds to the cost of health-care but also, takes a psychological toll on both patients and healthcare practitioners. Both sides would probably agree that prevention is preferable to litigation. Healthcare practitioners who use reasonable care in preventing professional liability (malpractice) claims are less likely to be faced with defending themselves against these claims.

Risk management is the act or practice of controlling risk. This process includes identifying and tracking risk areas, developing risk improvement plans as part of risk handling, monitoring risks, and performing risk assessments to determine how risks have changed. Proper documentation, patient satisfaction, appropriate behavior, proper medical procedures, and safeguards against exposure assist with decreasing the risk of malpractice lawsuits brought against the medical facility, physicians, and their staff.

Medical Negligence

Malpractice claims are lawsuits by patients against physicians for errors in diagnosis or treatment. Medical *negligence* cases are those in which a person believes that a medical professional did not perform an essential action or performed an improper one, thus harming the patient.

The following are some examples of malpractice:

- *Postoperative complications.* For example, a patient starts to show signs of internal bleeding in the recovery room. The incision is reopened and it is discovered that the surgeon did not complete closure (cauterization) of all the severed capillaries at the operation site.
- *Res ipsa loquitur.* This Latin term means “the thing speaks for itself” and refers to a case in which the doctor's fault is completely obvious—for example, a case in which a surgeon accidentally leaves a surgical instrument inside the patient.

The following are examples of medical negligence:

- *Abandonment.* A healthcare professional who stops care without providing an equally qualified substitute can be charged with **abandonment**. For example, a labor and delivery nurse is helping a woman in labor. The nurse's shift ends, but all the other nurses are busy and her replacement is late for work. Leaving the woman would constitute abandonment. A healthcare practitioner who intends to be away from her practice for an extended period of time may hire a **locum tenens**, literally “place holder.” For example, a physician taking maternity leave may hire another qualified physician to temporarily take her place. The substitute physician will

Ms. Gisele Monahan
234 Cutter Lane
Port Snead, YZ 12345-6789

RE: Closing of Medical Practice

Dear Ms. Monahan:

I regret to inform you that our medical practice will be closing on July 30, 20XX. The practice has been purchased by the Vaughn Group, 2345 Williamsburg Court, Port Snead, YZ 12345-6789.

If you wish to use this group of medical practitioners, please sign the enclosed authorization to release medical records form so that your files may be forwarded to them promptly.

Should you choose another physician, please send me a written request with your signature, authorizing the release of your medical records to the physician of your choice. Should we not hear from you prior to the practice closing date, all records will be stored at the Vaughn Group location for retrieval at a future date.

It has been my pleasure to provide your medical care.

Sincerely,

Alexis N. Whalen, MD

Enc: Authorization to Release Information

FIGURE 5-3 Sample letter notifying patient of medical practice closure.

act as the practicing physician's agent; therefore, abandonment is not an issue.

- **Delayed treatment.** A patient shows symptoms of some illness or disorder, but the doctor decides, for whatever reason, to delay treatment. If the delay is the direct cause of patient harm, the patient may have a negligence case.

The following legal terms are sometimes used to classify medical negligence cases:

- **Malfeasance** refers to an unlawful act or misconduct.
- **Misfeasance** refers to a lawful act that is done incorrectly.

- **Nonfeasance** refers to failure to perform an act that is one's required duty or that is required by law.

The Four Ds of Negligence The American Medical Association (AMA) lists the following "four Ds of negligence":

1. **Duty.** Patients must show that a physician-patient relationship existed in which the physician owed the patient a duty.
2. **Derelict.** Patients must show that the physician failed to comply with the standards of the profession. For example, a gynecologist has routinely taken Pap smears of a patient and then, for whatever reason, does not do so. If

the patient then shows evidence of cervical cancer, the physician could be said to have been derelict.

3. **Direct cause.** Patients must show that any damages were a direct cause of a physician's breach of duty. For example, if a patient fell on the sidewalk and damaged her cast, she could not prove that the cast was damaged because it was incorrectly or poorly applied by her physician. It would be clear that the damage to the cast resulted from the fall. If, however, the patient's leg healed incorrectly because of the way the cast had been applied, she might have a case.
4. **Damages.** Patients must prove that they suffered injury.

To go forward with a malpractice suit, a patient must be prepared to prove all four Ds of negligence.

Malpractice and Civil Law Malpractice (medical negligence) lawsuits are part of civil law, coming under the heading of torts. Recall that a tort is the intentional or unintentional breach of an obligation that causes harm or injury. A *breach of contract* is the failure of one of the parties to adhere to the terms of the contract.

In the case of medical care contracts, which are often implied contracts, either the provider or the patient can breach the contract. The provider can breach the contract by not maintaining patient confidentiality or by not providing adequate medical care (negligence). The patient can breach the contract by not showing up for appointments or by not following the physician's plan of care.

Settling Malpractice Suits Malpractice suits often require a trial in a court of law. Sometimes, however, they are settled through arbitration or mediation. *Arbitration* is a process in which the opposing sides choose a person or persons outside the court system, often with special knowledge in the field, to hear and decide the dispute. Arbitration is generally binding—that is, the parties agreeing to settle through arbitration must follow the solution arrived at by the arbitrator. Mediation is similar to arbitration in that the goal is to settle the case. The mediator does not judge the case but simply seeks a reasonable solution that both parties can agree upon. Mediation is generally nonbinding. (Your local or state medical society has information about the policy on arbitration or mediation for your state.) If injury, failure to provide reasonable care, or abandonment of the patient is proven to have occurred, the doctor must pay damages (a financial award) to the injured party.

If the physician you work with becomes involved in a lawsuit, you should be familiar with subpoenas and depositions. A *subpoena* is a written court order addressed to a specific person, requiring that person's presence in court on a specific date at a specific time. If you were directly involved in the patient case or have knowledge of the events that precipitated the lawsuit, you might be subpoenaed to provide testimony under penalty, known as *subpoena testificandum*. Another important term to know is *subpoena duces tecum*, which is a court order to produce specific, requested documents required at a certain place and time to enter into court records. If you are in charge of patient records at the practice, you will be required to locate, assemble,

photocopy, and arrange for delivery of the requested records or be charged with contempt of court if you do not comply. Prior to appearing in court, a healthcare practitioner may be asked to give a deposition, either as a defendant or an expert witness. The **deposition** is a sworn statement regarding the facts of the case and is used to prepare the case for trial.

Law of Agency According to the law of agency, an employee is considered to be acting as a doctor's agent (on the doctor's behalf) while performing professional tasks. The Latin term *respondeat superior*, or "let the master answer," is sometimes used to refer to this relationship. For example, the medical assistant's word is as binding as if it were uttered by the doctor (so you should never promise a patient a cure). With the law of agency, the doctor is responsible, or *liable*, for the negligence of employees. A negligent employee, however, may also be sued directly because individuals are legally responsible for their own actions. So a patient can sue both the doctor and the involved employee for negligence. The employer, or the employer's insurance company, also can sue the employee. Most likely, in a case of negligence, the doctor would be sued (because you as an employee are acting on the doctor's behalf), and you are usually covered by the doctor's malpractice insurance. Some medical assistants (usually clinical MAs) choose to obtain malpractice insurance. Obtaining personal malpractice insurance is a professional decision that depends on the type of work or facility in which you are employed. The American Association of Medical Assistants (AAMA) offers medical assisting malpractice insurance through various insurance companies at reduced rates.

Courtroom Conduct Most healthcare providers will never have to appear in court, but should you be asked to appear, the following suggestions may prove helpful:

- Attend court proceedings as required. Failure to appear in court could result in charges of contempt of court or in the case being forfeited.
- Do not be late for scheduled hearings.
- Bring required documents to court and present them only when requested to do so.
- Before testifying, refresh your memory concerning all the facts observed about the matter in question, like dates, times, words spoken, and circumstances.
- Speak slowly, clearly, and professionally. Do not use medical terms. Do not lose your temper or attempt to be humorous.
- Answer all questions in a straightforward manner, even if the answers appear to help the opposing side.
- Answer only the question asked, no more and no less.
- Appear well groomed, and wear clean, conservative clothing.

Professional Liability Coverage Professional liability coverage, also known as malpractice insurance, is specialty coverage to protect the physician and staff against financial losses due to lawsuits filed against them by their clients or

others. This coverage protects the physician if she is found to be negligent in her actions, and it protects the physician and her staff members if it is determined that any member is negligent in his or her actions. Professional liability coverage, however, comes at an extremely high cost to the practice. Society in general, and patients in particular, have extremely high expectations of physicians and of the medical community. Malpractice lawsuits have become quite commonplace. You have likely seen billboards advertising lawyers who offer assistance to patients who are unhappy with the medical care they have received.

It is no surprise, then, that malpractice insurance can be one of the most expensive accounts payable for the office. Depending on the type of specialty and the area of the country in which the physician practices, costs for an internist can be as low as \$4,000 per year in Minnesota (which has some of the lowest malpractice rates in the country) to a high of \$50,000 annually (in 2011) in Florida, which has some of the highest rates in the country. OB/GYNs, who have some of the highest rates of any specialty, can expect to pay anywhere from \$15,000 in Minnesota to \$80,000–\$200,000 per year in Florida for coverage.

Reasons Patients Sue

The following reasons were researched by interviewing families and patients who have sued healthcare practitioners:

1. *Unrealistic expectations.* With modern advancements in medical technology, patients often expect perfection in medical outcomes. They may feel betrayed by the healthcare system when a medical outcome is not what was expected.
2. *Poor rapport and poor communication.* Patients usually do not sue healthcare practitioners whom they like and trust. Healthcare providers who do not return telephone calls or are otherwise unavailable to a patient's family members may be perceived as arrogant, cold, or uncaring. When such perceptions exist, patients and family members are more likely to sue if something goes wrong.
3. *Greed and our litigious society.* Financial gain is seldom the reason for medical malpractice, but in some cases it may be an influencing factor. Malpractice attorneys sometimes make it very easy for patients to retain their services, such as contingency arrangements.
4. *Poor quality of care.* Poor quality means that a patient is truly not receiving quality care. Poor quality in "perception" means that the patient believes he or she is not receiving quality care, even if it is not true. Either situation can lead to a malpractice lawsuit.

Statute of Limitations Statutes of limitations are laws that set the deadline or maximum period of time within which a lawsuit or claim may be filed. The most common length of time is 2 years. The deadlines may vary depending on the circumstances and the type of case or claim. The periods of time also vary from state to state and depend on whether the lawsuit or claim is filed in federal or state court. The lawsuit or

claim is barred or disqualified if it is not filed before the statutory deadline. Under certain circumstances, a statute of limitations will be extended beyond its deadline. The following are examples for a civil claim for professional malpractice:

- *Medical:* 1 to 4 years from the act or occurrence of injury, or 6 months to 3 years from discovery; certain circumstances will extend the statute, including if the party is a minor, when a foreign object is involved, or in cases of fraud
- *Legal:* 1 to 3 years from date of discovery, or a maximum of 2 to 5 years from the date of the wrongful act

Four Cs of Medical Malpractice Prevention

1. *Caring.* As a healthcare professional, caring about your patients and colleagues is your most important asset. Showing patients that you care about them may result in an improvement in their medical condition and, if you are sincere, decreases the likelihood that patients will feel the need to sue if treatment has unsatisfactory results or if adverse events occur.
2. *Communication.* If you communicate in a professional manner and clearly ask for confirmation that you have been understood, you will earn respect and trust from your patients and other members of the allied health team.
3. *Competence.* Be competent in your skills and job knowledge by maintaining and updating your knowledge and skills frequently through continuing education.
4. *Charting.* Documentation is proof of competence. Make sure that all current reports and consultations have been reviewed by the physician and are evident in the chart. Chart every conversation or interaction you have with a patient.

How Effective Communication Can Help Prevent

Lawsuits Patients who see the medical office as a friendly place are generally less likely to sue. Physicians, medical assistants, and other medical office staff who have pleasant personalities and are competent in their jobs will have less risk of being sued. Medical assistants can help by

- Developing good listening skills and nonverbal communication techniques so that patients feel the time spent with them is not rushed.
- Setting aside a certain time during the day for returning patient phone calls.
- Checking to be sure that all patients or their authorized representatives sign informed consent forms (after all questions and concerns have been addressed) before they undergo medical or surgical procedures.
- Avoiding statements that could be construed as an admission of fault on the part of the physician or other medical staff.
- Using tact, good judgment, and professional ability in handling patients.
- Making every effort to reach an understanding about fees with the patient before treatment so that billing does not become a point of contention.

► Administrative Procedures and the Law

LO 5.4

Many of your administrative duties as a medical assistant are related to legal requirements and fall under the heading of risk management. When correct policies and procedures are followed, the risk of lawsuits decreases, but if a lawsuit is brought against the physician, the same policies and procedures will be the physician's best defense. Keep in mind that everything you do and do not do reflects not only on you but also on the physician and the practice. Always follow office policies and procedures and follow your "best practices" at all times to do your part to avoid lawsuits.

Paperwork for insurance billing, patient consent forms for surgical procedures, and correspondence (such as a physician's letter of withdrawal from a case) must be handled correctly to meet legal standards. Documentation of appropriate and accurate entries in a patient's medical record not only provides proof of continuity of care but is legally important, should the physician ever require the record for a legal case involving the patient. You also may maintain the physician's appointment book—also considered a legal document—especially for tracking missed or canceled appointments. You will explore this aspect of medical assisting in the *Schedule Management* chapter.

In your role as a medical assistant, you also may be responsible for handling certain state reporting requirements. Items that must be reported include births; certain communicable diseases such as acquired immunodeficiency syndrome (AIDS) and STIs; drug abuse; suspected child abuse or abuse of the elderly; injuries caused by violence, such as knife and gunshot wounds; and deaths. Reports are sent to various state departments, depending on the content of the report. For example, suspected child and elder abuse cases are reported to the state department of social services. Addressing these state requirements is called the physician's public duty.

Phone calls also must be handled with an awareness of legal issues. For example, if the physician asks you to contact a patient by phone and you call the patient at work, you should not identify yourself or the physician by name to someone else without the patient's permission. You can say, for example, "Please tell Mrs. Arnot that her doctor's office is calling." If you do not take this precaution, the physician can be sued for invasion of privacy. You must abide by similar guidelines if you are responsible for making follow-up calls to a patient after a procedure or an office visit and when leaving messages on answering machines or on voicemail where someone other than the person you are attempting to reach may pick them up.

Documentation

Patient records are often used as evidence in professional medical liability cases, and improper documentation can contribute to the loss of a case. Physicians should keep records that clearly show exactly what treatment was performed and when it was done. It is important that physicians be able to demonstrate that nothing was neglected and that the care given fully met the standards demanded by law. One cliché

to remember is "If it is not recorded, then it was not done." (On the same note, if it is recorded, it is assumed that it was done.) Pay attention to spelling in charts and keep a medical dictionary handy if you are not sure of a spelling. Today's healthcare environment requires complete documentation of actions taken and actions not taken. Medical staff members should pay particular attention to the following situations.

Referrals Make sure the patient understands whether you will be making the appointment with the referring physician, whether the specialty physician's staff will be calling to make the appointment with the patient, or whether the patient must call to set up the appointment. Document in the chart that the patient was referred, to whom, and how the appointment is to be made. If the date and time of the appointment are known, document this information also. Follow up with the specialist to verify that the appointment was kept. If a paper referral is necessary, make sure a hard copy is placed in the patient's chart. If the referral is made electronically, note the referral number in the patient's chart. Note whether reports of the consultation were received in your office, and document any further care the patient is to receive from the specialty physician.

Missed Appointments At the end of the day, a designated person in the medical office should document the charts of those patients who missed or canceled appointments without rescheduling. Charts should be dated and documented "No Call/No Show" or "Canceled/Not Rescheduled." The appointment book is also considered a legal document; make sure that all missed appointments are documented in the appointment book or within the electronic scheduling system. The treating physician should review these records and note whether follow-up is indicated.

Dismissals To avoid charges of abandonment, the physician must formally withdraw from a case. Be sure that a letter of withdrawal or dismissal has been filed in the patient's records (refer to Figure 5-2). All mailing confirmations should be filed in the record, such as the return receipt from certified mail.

All Other Patient Contact Patient records should include reports of all tests, procedures, and medications prescribed, including prescription refills. Make sure all necessary informed consent papers have been signed and filed in the chart. Make entries into the chart of all telephone conversations with the patient. Correct documentation requires the initials or signature of the person making the notation on the patient's chart as well as the date and time.

Medical Record Correction Errors made when making an entry in a medical record or errors discovered later can be corrected, but corrections must be made in a certain manner so that if the medical records are ever used in a medical malpractice lawsuit, it will not appear that they were falsified. So when deleting information, never black it out, never use correction fluid to cover it up, and never in any other way erase or obliterate the original wording. Draw a line through the

original information so that it is still legible. Write or type in the correct information above or below the original line or in the margin. The *Medical Records and Documentation* chapter describes the proper procedure for correcting paper chart errors, and the *Electronic Health Records* chapter discusses the procedure for electronic health records.

Ownership of the Patient Record Patient medical records are considered the property of the owners of the facility where they were created. A physician in a private practice owns his or her charts or records, while records in a hospital or clinic belong to the facility. It is important to remember that although the facility in which the records were created owns the records, the patient owns the information they contain. Upon signing a release, patients may usually obtain access to or copies of their medical records, depending upon state law. Under HIPAA, patients who ask to see or copy their medical records must be accommodated with a few exceptions, such as with mental health records. If the physician decides it may be harmful to the patient to see the contents of the medical record and denies access, the physician is protected under the *doctrine of professional discretion*.

Retention and Storage of the Patient Record As a protection against legal litigation, records should be kept until the applicable statute of limitations period has elapsed, which is generally 7 years. In some cases, the medical records for minor patients must be kept for a specified length of time after they reach legal age. Some states have enacted statutes for the retention of medical records. Because the federal False Claims Act requires that financial records be kept for 10 years and medical records are often required to back up financial records, many legal experts suggest that medical records also should be kept for a minimum of 10 years. Most physicians retain records indefinitely to provide evidence in medical professional liability suits or for tax purposes. The medical record may provide the patient's medical history for future medical treatment. The chapter *Managing Medical Records* will go into more detail on this subject.

Credentialing *Credentialing* is used by various organizations, including insurance carriers, to ensure that healthcare providers are appropriately qualified to provide services and meet all the necessary requirements to do so. The qualifications are determined and approved by unbiased physician peer review groups. Specific criteria vary according to the physician or provider specialty and the provider's scope of practice. Physicians are broken into two types according to medical licensure—MD (medical doctor) or DO (doctor of osteopathy)—and then further broken down according to specialty.

As the office medical assistant, you may be responsible for credentialing any new providers joining the practice. In general, insurance companies require their doctors to hold and maintain the proper credentials. In order for a physician to participate with an insurance carrier such as Medicare, he must have the necessary professional credentials and go through the Medicare credentialing process, or he will not be allowed to bill Medicare for services provided to Medicare beneficiaries.

Medicare has three forms for credentialing:

1. Form 855B is used to establish or change a practice group number.
2. Form 855I is used to establish or reestablish a physician's individual number. In addition to completing this 29-page application, the physician also must provide his or her medical school diploma, individual NPI (national provider identifier), current license number, any board certifications for specialties, work history for at least 5 years, statement of any limitations, history of loss of licensure or felony convictions, history of loss or limitations of privileges or disciplinary actions, and outside verification of information provided.
3. Form 855R is used to link individual provider numbers to group practice numbers.

These forms are not complicated, but they are time-consuming. More information about Medicare's credentialing process can be found on the CMS website at <http://www.cms.gov/manuals/downloads>. In addition to the paper-based forms, CMS has established the Internet-based Provider Enrollment Chain and Ownership System (PECOS). This system allows physicians, nonphysician practitioners, and provider and supplier organizations to enroll, make a change in their Medicare enrollment, view their Medicare enrollment information on file with Medicare, or check on the status of a Medicare enrollment application via the Internet. Regardless of the application method used, once the Medicare credential is received, many other insurance plans will follow suit with credentialing or linking so the provider can also bill them for services provided. If a separate credentialing process is required, it is generally much less complicated than that required by Medicare.

The Food and Drug Administration Regulatory Function

The Food and Drug Administration (FDA) requires that drug manufacturers perform clinical tests on new drugs before humans use these drugs. These tests include toxicity tests in laboratory animals, followed by clinical studies (frequently called clinical trials). Venipuncture is performed and blood is drawn from controlled groups of volunteers. See Figure 5-4. Some volunteers are patients; others are healthy subjects.

Clinical tests are designed to consider the ratio of benefits to the risk of adverse side effects. If the clinical tests prove that the drug is safe and effective, the FDA approves it for marketing. The manufacturer must continue to demonstrate the drug's safety and efficacy (therapeutic value) and must submit reports whenever it discovers unexpected adverse reactions. The FDA can withdraw a drug from the market at any time if evidence suggests that it is no longer safe or effective.

During the clinical trials, the pharmaceutical (drug) company studies all aspects of the pharmacology of the new drug. When the company seeks approval from the FDA, it must document the pharmacodynamics, pharmacokinetics, safety (how many and what kind of adverse effects), and efficacy of the drug. In addition, it must present data regarding the effective dose—the amount of drug given at one time.

FIGURE 5-4 Blood tests provide baseline data on volunteers at the start of clinical drug trials.
© liquidlibrary/PictureQuest RF

After the FDA approves a drug, it continues its regulatory function to protect patients and consumers. These regulatory functions are discussed in detail in the chapter *Principles of Pharmacology* and include the following:

- Review of new indications proposals (applications from companies for new uses for a drug)
- Drug manufacturing—ensuring the proper identity, strength, purity, and quality of each drug
- Over-the-counter (nonprescription) drugs—approving drugs for use without supervision by a healthcare practitioner
- Prescription drugs—monitoring safety, use, and availability of drugs prescribed by healthcare practitioners
- Pregnancy categories—risk categories established by the FDA based upon the degree to which available information has ruled out risk to the fetus or breastfed infant.
- Controlled substances—regulation of drugs or drug products that are potentially dangerous or addictive
- The Comprehensive Drug Abuse Prevention and Control Act, also known as the Controlled Substances Act (CSA)—federal law established to strengthen regulation of potentially dangerous or addictive drugs by
 - Creating the Drug Enforcement Administration (DEA)
 - Designating five schedules for drugs based on the degree of potential the substance has for abuse or non-therapeutic use
 - Requiring doctors who administer, dispense, or prescribe any controlled substance to register with the DEA

Legal Documents and the Patient

You need to be aware of several legal documents that are typically completed by a patient prior to major surgery or hospitalization, including the advance medical directive, the durable power of attorney, and the uniform donor card. The Patient

Self-Determination Act (PSDA), implemented in 1991, was designed to encourage patients and healthcare professionals to discuss end-of-life issues. According to the PSDA, certain healthcare facilities that are Medicare and Medicaid providers are required to ask each patient, age 18 or older, if he or she has an advance directive. Facilities are also required to inform patients of their policies regarding recognizing advance directives. They must discuss the patients' healthcare decision-making rights under state law regarding end-of-life issues. Contact your state's Public Health Department website for additional information.

Advance Medical Directive This is a legal document addressed to the patient's family and healthcare providers stating what type of treatment the patient wishes or does not wish to receive if she becomes terminally ill, unconscious, or permanently comatose (sometimes referred to as being in a persistent vegetative state). For example, an advance directive typically states whether a patient wishes to be put on life-sustaining equipment if she becomes permanently comatose. Some directives contain DNR (do not resuscitate) orders. These orders mean the patient does not wish medical personnel to try to resuscitate her if her heart stops beating. The directive is signed when the patient is mentally and physically competent to do so. It also must be signed by two witnesses. Advance medical directives are a means of helping families of terminally ill patients deal with the inevitable outcome of the illness. Having these advance directives in place can lower stress levels, as difficult decisions have already been made, and may help limit unnecessary medical costs.

Medical practices can help patients develop an advance medical directive, sometimes in conjunction with organizations that make available preprinted living will forms. The Partnership for Caring (based in Washington, DC) is one such organization.

Durable Power of Attorney Patients who have an advance medical directive are asked to name, in the second document, called a **durable power of attorney** (also known as a healthcare proxy), someone who will make decisions regarding medical care on their behalf if they are unable to do so. It is important that the person named in the durable power of attorney knows the patient's wishes ahead of time, so in the event that he is required to make medical decisions, he can be confident he is carrying out the patient's wishes.

The Uniform Donor Card In 1968, the Uniform Anatomical Gift Act was passed, setting forth guidelines for all states to follow in complying with a person's wish to make a gift of one or more organs (or the whole body) upon death. An anatomical gift is typically designated for medical research, organ transplants, or placement in a tissue bank. The uniform donor card is a legal document that states one's wish to make such a gift. People often carry the uniform donor card in their wallets. Many medical practices offer the service of helping their patients obtain and complete a uniform donor card. In some states, the Department of Motor Vehicles makes

the process simple by asking you at the time you renew your driver's license if you would like to be an organ donor, with a card being issued to you at that time and a notation made on the driver's license that you are an organ donor. The patient's family should be aware of this wish to be an organ donor so that it is carried out upon the patient's death.

► Federal Legislation Affecting Healthcare

LO 5.5

Congress has passed legislation intended to improve the quality of healthcare in the United States, reduce fraud, and ensure that insurance providers will not discriminate against patients. The most significant healthcare laws passed in recent years are the Health Care Quality Improvement Act of 1986, the False Claims Act, the Genetic Information Nondiscrimination Act of 2008, and the Health Insurance Portability and Accountability Act of 1996. In addition, the Occupational Safety and Health Administration regulations are vital to the practice of healthcare and the safety of its practitioners, and these, too, are reviewed and often updated by the administration.

Health Care Quality Improvement Act of 1986

The Health Care Quality Improvement Act of 1986 (HCQIA) is a federal statute passed to improve the quality of medical care nationwide. Congress created HCQIA after discovering an increasing occurrence of medical malpractice and a need to improve the quality of medical care. The act requires professional peer review in certain cases, limits damages to professional reviewers, and protects from liability those who provide information to professional review bodies. One of the most important provisions of the HCQIA was the establishment of the National Practitioner Data Bank, designed to improve the quality of medical care nationwide by encouraging effective professional peer review of physicians. Information that must be reported to the National Practitioner Data Bank includes medical malpractice payments, adverse licensure actions, adverse clinical privilege actions, and adverse professional membership actions. This data bank is a resource to assist state licensing boards, hospitals, and other healthcare entities in investigating the qualifications of physicians and other healthcare practitioners.

False Claims Act

The False Claims Act is a federal law that allows individuals to bring civil actions on behalf of the US government for false claims made to the federal government, under a provision of the law call *qui tam* (from Latin, meaning to bring an action for the king and for one's self). The law was enacted because of the rising cost of healthcare, fraud, and abuse within the healthcare industry. As a result, laws have been passed to control three types of illegal conduct:

1. *False billing claims.* Fraudulently billing for services not performed is prohibited.

2. *Kickbacks.* Giving financial incentives to a healthcare provider for referring patients or for recommending services or products is prohibited under the federal Anti-Kickback Law and by state laws.
3. *Self-referrals.* Referring patients to any service or facility where the healthcare provider has financial interests is prohibited by the Federal Ethics in Patient Referral Act and other federal and state laws.

Violations of laws against healthcare fraud and abuse can result in imprisonment and fines, the loss of professional licensure, the loss of healthcare facility staff privileges, and exclusion from participating in federal healthcare programs such as Medicare and Medicaid.

Genetic Information Nondiscrimination Act of 2008

The Genetic Information Nondiscrimination Act of 2008 (GINA) was enacted by Congress to protect the rights of individuals from discrimination based on their genetic information. Protected genetic information includes the following:

- An individual's genetic test information
- Genetic test information of an individual's family member
- Information about a disease or disorder that has occurred in an individual's family member

This act prohibits insurance carriers and employers from using genetic information as a basis for denying insurance coverage or employment. Title I of GINA states that insurance carriers may not use genetic information to determine an individual's eligibility, coverage, underwriting, or premium cost. Health insurers may not require individuals to have genetic testing in order to obtain insurance coverage. Insurers also may not use previous genetic testing results to determine enrollment or coverage. Title II of GINA states that employers also are restricted from requiring genetic testing or using previous genetic testing results to determine eligibility for employment.

Occupational Safety and Health Administration

The Occupational Safety and Health Administration (OSHA), a division of the US Department of Labor, has created federal laws to protect healthcare workers from health hazards on the job. Medical personnel may accidentally contract a dangerous or even fatal disease by coming into contact with the body fluids of a patient contaminated with a virus. Medical assistants also may be exposed to toxic substances in the office. OSHA regulations describe the precautions a medical office must take with clothing, housekeeping, recordkeeping, and training to minimize the risk of disease or injury.

Some of the most important OSHA regulations are those for controlling workers' exposure to infectious disease. These regulations are set forth in the OSHA Bloodborne Pathogens Protection Standard of 1991. A pathogen is any microorganism that causes disease. Microorganisms are microscopic

living bodies, such as viruses or bacteria, that may be present in a patient's blood or other body fluids (saliva or semen).

Of particular concern to medical workers are the human immunodeficiency virus (HIV), which causes AIDS, and the hepatitis B virus (HBV). AIDS damages the body's immune system and thus its ability to fight disease. Historically, AIDS has almost always been fatal, but better antiviral drugs have been more and more successful in keeping the virus under control. HBV is a highly contagious disease that is potentially fatal. It causes inflammation of the liver and may cause liver failure. Every year, about 8,700 healthcare workers become HBV-infected from patient-related or body substance exposures at work, and about 200 die from the disease.

OSHA requires that medical professionals in medical practices follow what are called Standard Precautions. These were developed by the Centers for Disease Control and Prevention (CDC) to prevent medical professionals from exposing themselves and others to bloodborne pathogens. Exposure can occur, for example, through skin that has been broken from a needle puncture or other wound and through mucous membranes, such as those in the nose and throat. If these areas come into contact with a patient's (or coworker's) blood or body fluids, a virus could be transferred from one person to another. The chapter *Infection Control Fundamentals* discusses OSHA and Standard Precautions in more detail.

Health Insurance Portability and Accountability Act

On August 21, 1996, the US Congress passed the Health Insurance Portability and Accountability Act (HIPAA). The primary goals of the act were to improve the portability and continuity of healthcare coverage in group and individual markets; to combat waste, fraud, and abuse in healthcare insurance and healthcare delivery; to promote the use of medical savings accounts; to improve access to long-term care services and coverage; and to simplify the administration of health insurance.

The primary purposes of HIPAA are to

- Improve the efficiency and effectiveness of healthcare delivery by creating a national framework for health privacy protection that builds on efforts by states, health systems, individual organizations, and individuals.
- Protect and enhance the rights of patients by providing them access to their health information and controlling the inappropriate use or disclosure of that information.
- Improve the quality of healthcare by restoring trust in the healthcare system among consumers, healthcare professionals, and the multitude of organizations and individuals committed to the delivery of care.

HIPAA is divided into two main sections of law: Title I, which addresses healthcare portability, and Title II, which covers the prevention of healthcare fraud and abuse, administrative simplification, and medical liability reform. Although in this text you will study Titles I and II in more detail, you also should be aware of three other titles included in HIPAA regulations: Title III—tax-related health provisions governing medical

savings accounts; Title IV—application and enforcement of group health insurance requirements; and Title V—revenue off set governing tax deductions for employers providing company-owned life insurance premiums.

Title I: Healthcare Portability The issue of portability deals with protecting healthcare coverage for employees who change jobs, allowing them to carry their existing plans with them to new jobs. HIPAA provides the following protections for employees and their families:

- Increases workers' ability to get healthcare coverage when starting a new job
- Reduces workers' probability of losing existing healthcare coverage
- Helps workers maintain continuous healthcare coverage when changing jobs
- Helps workers purchase health insurance on their own if they lose coverage under an employer's group plan and have no other healthcare coverage available

The specific protections of this title include the following:

- Limits the use of exclusions for preexisting conditions
- Prohibits group plans from discriminating by denying coverage or charging extra for coverage based on an individual's or a family member's past or present poor health
- Guarantees certain small employers, as well as certain individuals who lose job-related coverage, the right to purchase health insurance
- Guarantees, in most cases, that employers or individuals who purchase health insurance can renew the coverage regardless of any health conditions of individuals covered under the insurance policy

Title II: Prevention of Healthcare Fraud and Abuse, Administrative Simplification, and Medical Liability Reform

The HIPAA Standards for Privacy of Individually Identifiable Health Information (IIHI) provided the first comprehensive federal protection for the privacy of both IIHI and personal, or protected, health information. The *HIPAA Privacy Rule* is designed to provide strong privacy protections that do not interfere with patient access to healthcare or the quality of healthcare delivery. The privacy rule is intended to

- Give patients more control over their health information.
- Set boundaries on the use and release of healthcare records.
- Establish appropriate safeguards that healthcare providers and others must achieve to protect the privacy of health information.
- Hold violators accountable, with civil and criminal penalties that can be imposed if they violate patients' privacy rights.
- Strike a balance when public responsibility supports disclosure of some forms of data—for example, to protect public health.

Before the HIPAA Privacy Rule, the personal information transferred among healthcare providers and third-party payers fell under a patchwork of federal and state laws. This meant that unless forbidden by state or local law, IIHI could be distributed, for reasons that had nothing to do with a patient's medical treatment or healthcare reimbursement, to other agencies. For example, patient information held by a health plan could be passed on to a lender, who could then deny the patient's application for a home mortgage or a credit card; or it could be given to an employer, who could use it in personnel decisions—all without patient knowledge or consent. HIPAA stopped that.

Individually identifiable health information includes

- Patient name, address, phone numbers, and e-mail address.
- Patient dates (birth, death, admission, discharge, etc.).
- Social Security number.
- Medical record numbers.
- Health plan beneficiary numbers.
- Account numbers.
- Certificate or license numbers.
- Vehicle identifiers and serial numbers, including license plate numbers.
- Device identifiers and serial numbers.
- Web Universal Resource Locators (URLs) and Internet Protocol (IP) addresses.

The core of the HIPAA Privacy Rule is the protection, use, and disclosure of *protected health information (PHI)*. Protected health information means individually identifiable health information that is transmitted or maintained by electronic or other media, such as computer storage devices. The Privacy Rule protects all PHI held or transmitted by a covered entity, which includes healthcare providers, health plans, and healthcare clearinghouses. Other covered entities include employers, life insurers, schools or universities, and public health authorities. PHI can come in any form or medium, such as electronic, paper, or oral, including verbal communications among staff members, patients, and other providers. The Privacy Rule covers the following PHI:

- The past, present, or future physical or mental health or condition of an individual
- Healthcare that is provided to an individual
- Billing or payments made for healthcare provided

Information that is not individually identifiable or is unable to be tied to the identity of a particular patient is not subject to the Privacy Rule.

Use and *disclosure* are the two fundamental concepts in the HIPAA Privacy Rule. It is important to understand the differences between these terms. *Use* limits the sharing of information within a covered entity. Performing any of the following actions to PHI by employees or other members of an organization's workforce means the information is being used:

- Sharing
- Employing
- Applying

- Utilizing
- Examining
- Analyzing

Disclosure restricts the sharing of information outside the entity holding the information. Performing any of the following actions so that information is transmitted outside the entity constitutes disclosure:

- Releasing
- Transferring
- Providing access to
- Divulging in any manner

Managing and Storing Patient Information Because of HIPAA, medical facilities have undergone many changes to the way they manage and store patient information. Many facilities now contract consultants that specialize in HIPAA, and large facilities, such as hospitals, often employ a compliance officer. Patients must be given the opportunity to read the office privacy practices and receive a copy of them, signing an acknowledgment that they have received them. Should the patient refuse to sign the acknowledgment, the refusal should be documented in the medical record to prove *due diligence* and a "good faith effort" by the office to provide the patient with the privacy practices. The Privacy Rule requires the provider to perform activities including

- Notifying patients of their privacy rights and how their information is used.
- Adopting and implementing privacy procedures for its practice, hospital, or plan.
- Training employees so that they understand the privacy procedures.
- Designating an individual responsible for seeing that the privacy procedures are adopted and followed.
- Securing patient records containing IIHI so that they are not readily available to those who do not need them.

Patient Notification Since the HIPAA Privacy Rule's effective date, medical facilities have made major changes in how they inform patients of their HIPAA compliance. You may have noticed, as a patient yourself, the forms and information packets that are now provided by your healthcare providers. The first step in informing patients of HIPAA compliance is the communication of patient rights, conveyed through a document called Notice of Privacy Practices (NPP). This notice must

- Be written in plain, simple language.
- Include a header that reads, "This notice describes how medical information about you may be used and disclosed and how you can get access to this information. Please review carefully."
- Describe the covered entity's uses and disclosures of PHI.
- Describe an individual's rights under the Privacy Rule.
- Describe the covered entity's duties.

- Describe how to register complaints concerning suspected privacy violations.
- Specify a point of contact.
- Specify an effective date.
- State that the entity reserves the right to change its privacy practices.

See Figure 5-5 for an example of a HIPAA Notice of Privacy Practices. Procedure 5-1, found at the end of this chapter, outlines the steps in obtaining a signature for receipt of the NPP.

In addition to understanding the office obligations under HIPAA, remember, it has also given patients an increased understanding about their right to privacy regarding their health information. These rights include the following:

- The right to access, copy, and inspect their healthcare information
- The right to request an amendment to their healthcare information
- The right to obtain an accounting of certain disclosures of their healthcare information

Notice of Privacy Practices

I understand that BWW Medical Associates, PC creates and maintains medical records describing my health history, symptoms, examinations, test results, diagnoses, treatments, and plans for my future care and/or treatment. I further understand that this information may be used for any of the following:

1. Plan and document my care and treatment
2. Communicate with health professionals involved in my care and treatment
3. Verify insurance coverage for planned procedures and/or treatments for the applicable diagnoses
4. Application of any medical or surgical procedures and diagnoses (codes) to my medical insurance claim forms as application for payment of services rendered
5. Assessment of quality of care and utilization review of the healthcare professionals providing my care

Additionally, it has been explained to me that

1. A complete description of the use and disclosure of this information is included in the *Notice of Information of Privacy Practices*, which has been provided to me.
2. I have had a right to review this information prior to signing this consent.
3. BWW Medical Associates, PC has the right to change this notice and their practices.
4. Any revision of this notice will be mailed to me at the address I provided to them prior to its implementation.
5. I may object to the use of my health information for specific purposes.
6. I may request restrictions as to the manner my information may be used or disclosed in order to carry out treatment, payment, or health information.
7. I understand that it is not required that my requested restrictions be honored.
8. I may revoke this consent in writing, except for those disclosures which may have taken place prior to the receipt of my revocation.

At the time of the document signing, I request the following restrictions to disclosure or use of my health information: _____

Printed Name of Patient or Legal Guardian

Printed Name of Witness/Title

Date: _____

Signature of Parent or Legal Guardian

Signature of Witness/Title

FIGURE 5-5 Example of a Notice of Privacy Practices and acknowledgment.

- The right to alternate means of receiving communications from providers
- The right to complain about alleged violations of the regulations and the provider's own information policies

Figure 5-6 gives an example of a typical privacy violation complaint form, which the office should keep on hand in case a patient feels his privacy rights have been violated. As the medical assistant, you may need to help the patient complete this form. Procedure 5-2 at the end of this chapter provides practice in assisting with this form.

Sharing Patient Information When sharing patient information, HIPAA will allow the provider to use healthcare information for *treatment, payment, and operations (TPO)*:

- *Treatment.* Providers are allowed to share information in order to provide care to patients.
- *Payment.* Providers are allowed to share information in order to receive payment for the treatment provided.
- *Operations.* Providers are allowed to share information to conduct normal business activities, such as quality improvement.

Privacy Violation Complaint

As per our Privacy Policies and Procedures, we are providing this form for individuals who feel they have a complaint regarding how their protected health information was handled by our office. You have the right to make a complaint and we may take no retaliatory actions against you because of it. We will respond to this complaint within 30 days of its receipt.

Patient Name: _____

Address: _____

DOB: _____ Date of Complaint: _____

Phone: Home _____ Cell _____ Work _____

Best time to reach you: _____

Reason for the complaint (please be as specific as possible, attaching additional documentation as necessary): _____

Signature

Date

Office Use Only

Received by: _____ Date: _____

Follow-up Started on (date): _____

FIGURE 5-6 Sample of a Privacy Violation Complaint form.

If the use of patient information does not fall under TPO, then written authorization must be obtained before sharing information with anyone (Figure 5-7). Some of the core elements of an authorization form are

- Specific and meaningful descriptions of the authorized information.
- Persons authorized to use or disclose protected health information.
- Purpose of the requested information.

- Statement of the patient's right to revoke the authorization.
- Signature of the patient and date signed.

Procedure 5-3 at the end of the chapter outlines the steps to be taken to obtain an authorization to release PHI.

HIPAA Security Rule In February 2003, the final regulations were issued regarding the administrative, physical, and technical safeguards to protect the confidentiality, integrity, and availability of health information covered by HIPAA.

Authorization to Release Health Information

I, _____, residing at _____ and DOB of _____, give permission to (name of practice) _____ to release to _____ of BWW Medical Associates, PC the following information: _____

Reason for the Request: _____

Signature of Patient or Legal Guardian _____

Printed Name of Patient or Legal Guardian _____

If Guardian, Relationship to Patient _____

This authorization will expire on _____

YOU MAY REFUSE TO SIGN THIS AUTHORIZATION. You may revoke this authorization at any time by notifying BWW Medical Associates, PC in writing. Revocation will have no effect on actions taken prior to receipt of any revocation. Any disclosure of information carries the potential for unauthorized redisclosure and the information may not be protected by federal confidentiality rules.

FIGURE 5-7 An example of an Authorization to Release Health Information form.

The *Security Rule* specifies how patient information is protected on computer networks, the Internet, disks, and other storage media and extranets. However, the rapidly increasing computer use in healthcare has created new dangers for confidentiality breaches. The Security Rule mandates that

- A security officer must be assigned the responsibility for the medical facility's security.
- All staff, including management, must receive security awareness training.
- Medical facilities must implement audit controls to record and examine staff who have logged into information systems that contain PHI.
- Organizations must limit physical access to medical facilities that contain electronic PHI.
- Organizations must conduct risk analyses to determine information security risks and vulnerabilities.
- Organizations must establish policies and procedures that allow access to electronic PHI on a need-to-know basis.

Computers are not the only concern regarding workplace security. The facility layout can pose a possible violation if not designed correctly. All facilities must take measures to reduce the identity of patient information. Some examples of facility design that can help reduce a confidentiality breach include the security of patient medical records (including charts), the reception area, the clinical station (or patient care area), and the location of fax machines.

- *Chart security.* When paper health records are used, patient charts and the information contained within them can be kept confidential by following these rules:
 1. Charts that contain a patient's name or other identifiers cannot be in view at the front reception area or nurse's station. Some offices have placed charts in plain jackets to prevent information from being seen.
 2. Charts must be stored out of view of a public area to prevent unauthorized individuals from seeing them.
 3. Charts should be placed on the filing shelves without the patient name showing.
 4. Charts should be locked when not in use. Many facilities have purchased filing equipment that can be locked and unlocked without limiting the availability of patient information.
 5. Every staff member who uses patient information must be logged and a confidentiality statement signed. Signatures of staff should be on file with the office.
- *Reception area security.* To be compliant with security rules, the following steps should be taken to secure the reception area:
 1. Log off or lock your computer or terminal, shutting off the monitor when leaving your terminal or computer.
 2. The computer must be placed in an area where patients and unauthorized personnel cannot see the screen.
 3. Many facilities are purchasing flat screen monitors to prevent visibility of the screen.
 4. Patient sign-in sheets may be used but must not include

the reason or nature of the patient visit. Likewise, patient names may be called out as long as no reference to the reason for the visit is made.

5. Call centers and reception area phone conversations must be kept confidential. Many offices put the administrative office behind sliding glass windows to allow for privacy when on the phone with other patients or offices, so that people in the reception area cannot hear phone conversations.
- *Patient care area security.* All healthcare personnel should follow these guidelines to protect PHI in patient care areas:
 1. Log off or lock computer terminals, turning off the monitor when leaving the computer station.
 2. When placing charts in exam room racks or shelves, the name of the patient or other identifiers must be concealed from view.
 3. When discussing a patient with the physician or another staff member, make sure your voice is lowered and that all doors to the exam rooms are closed. Avoid discussing patient conditions in heavy traffic areas.
 4. When discussing a condition with a patient, make sure that you are in a private room or area where no one can hear you.
 5. Avoid discussing patients in lunchrooms, hallways, or any other place in a medical facility where someone can overhear you.
 - *Fax security.* As a vital link among healthcare providers, insurance plans, and others, much information is exchanged over the fax machine in a medical office, particularly if the office is paper-based and does not have access to electronic communication. Private health information can be exchanged via faxes sent to covered entities, but PHI must still be safeguarded as much as possible by taking the following precautions:
 1. Use a fax cover page. State clearly on the fax cover sheet that confidential and protected health information is included. Further state that the information included is to be protected and must not be shared or disclosed without the appropriate authorizations from the patient.
 2. Keep the fax machine in an area that is not accessible by individuals who are not authorized to view PHI.
 3. Faxes received containing PHI must be stored promptly in a protected, secure area.
 4. Always confirm the accuracy of fax numbers to minimize the possibility of faxes being sent to the wrong person. Call recipients to confirm the fax was received.
 5. Program the fax machine to print a confirmation for all faxes sent, and staple the confirmation sheet to each document sent.
 6. Train all staff members to understand the importance of safeguarding PHI sent or received via fax.
 - *Copier security.* Medical assistants should follow these guidelines to protect PHI at the copier:
 1. Do not leave confidential documents anywhere on or near the copier where others can read the information.

2. Shred copies containing PHI when no longer needed—do not discard copies in a trash container.
3. If a paper jam occurs, after removing the paper causing the jam, shred it if PHI is contained within the document.
- **Printer security.** To maintain the confidentiality of printed materials, follow these guidelines:
 1. Do not print confidential material on a printer shared by other departments or in an area where others can read the material.
 2. Do not leave the printer unattended while printing confidential material.
 3. Before leaving the printing area, make sure all computer disks, CDs, DVDs, or “jump drives” containing confidential information and all printed material have been collected.
 4. Be certain that the print job is sent to the correct printer location.
 5. Shred any discarded printouts—do not throw them in a trash container.

Violations and Penalties Each staff member is responsible for adhering to HIPAA privacy and security regulations to ensure that PHI is secure and confidential. If PHI is abused or confidentiality is breached, the medical facility can incur substantial penalties or even the incarceration of staff. Violations of HIPAA law can result in both civil and criminal penalties.

- **Civil penalties** for HIPAA privacy violations can be up to \$100 for each offense, with an annual cap of \$25,000 for repeated violations of the same requirement.
- **Criminal penalties** for the knowing, wrongful misuse of individually identifiable health information can result in penalties ranging from \$50,000 to \$250,000 in fines and between 1 and 10 years in prison.

Administrative Simplification The main key to the set of rules established for HIPAA administrative simplification is standardizing patient information throughout the healthcare system with a set of transaction standards and code sets. The codes and formats used for the exchange of medical data are referred to as *electronic transaction records*. Regulated transaction information receives a transaction set identifier. For example, a healthcare claim would receive an identifier of ASC X12N 837 version 5010—a standard transaction code given to any facility that submits an electronic healthcare claim to an insurance company.

Standardized code sets are used for encoding data elements. The following books are used for the standardized code sets for all healthcare facilities:

- **ICD-9-CM/ICD-10-CM.** This book is used to identify diseases and conditions. The transition to the ICD-10 version is planned for October 2015.
- **CPT 4.** This book is used to identify physician services or procedures.

- **HCPCS.** This book is used to identify health-related services and procedures, such as pharmaceuticals or hearing and vision services, that are not included in the CPT manual.

► Confidentiality Issues and Mandatory Disclosure

LO 5.6

Related to law, ethics, and quality care is the issue of when a healthcare worker, including a medical assistant, can disclose information and when it must be kept confidential. The incidents that doctors are legally required to report to the state were outlined earlier in the chapter. A doctor can be charged with criminal action for not following state and federal laws.

Ethics and professional judgment are always important. Consider the question of whether to contact the partners of a patient who has a sexually transmitted infection (STI) and whether to keep the patient's name from those people. The law says that the physician must instruct patients on how to notify possibly affected third parties and give them referrals to get the proper assistance. If the patient refuses to inform involved outside parties, then the doctor's office may offer to notify current and former partners. The *Caution: Handle with Care* section addresses this issue.

In general, the patient's ethical right to confidentiality and privacy is protected by law. Only the patient can waive the right to confidentiality. A physician cannot publicize a patient case in journal articles or invite other health professionals to observe a case without the patient's written consent. Most states also prohibit a doctor from testifying in court about a patient without the patient's approval. When a patient sues a physician, however, the patient automatically gives up the right to confidentiality.

The following are six principles for preventing improper release of information from the medical office.

1. When in doubt about whether to release information, it is better not to release it.
2. It is the patient's right, not the physician's, to keep patient information confidential. If the patient wants to disclose the information, it is unethical for the physician not to do so.
3. All patients should be treated with the same degree of confidentiality, whatever the healthcare professional's personal opinion of the patient might be.
4. You should be aware of all applicable laws and of the regulations of agencies such as public health departments.
5. When it is necessary to break confidentiality and when there is a conflict between ethics and confidentiality, discuss it with the patient. If the law does not dictate what to do in the situation, the attending physician should make the judgment based on the urgency of the situation and any danger that might be posed to the patient or others.
6. Get written approval from the patient before releasing information. For common situations, the patient should sign a standard release-of-records form.

CAUTION: HANDLE WITH CARE

Notifying Those at Risk for Sexually Transmitted Infection

Few things are more difficult for a patient with an STI than telling current and former partners about the diagnosis. In fact, some patients elect not to do so. When patients refuse to alert their partners, the medical office can offer to make those contacts. Often that responsibility lies with the medical assistant.

You are most likely to encounter such a situation if you are a medical assistant working in a family practice, an OB/GYN practice, or a clinic. So becoming familiar with all facets of the situation—from ensuring patient confidentiality to handling potentially difficult confrontations—will help you best serve the patient.

The first step is to get the appropriate information from the patient who has contracted the STI. Because the patient may be sensitive about revealing former and current partners, help him feel more comfortable. First, spend some time talking about the STI. How much does the patient know about it? Educate him about implications, including the probable short- and long-term effects of the infection. Explain how the STI is transmitted. Alert the patient as to precautions to take so he will not continue to transmit the infection to others. Help the patient understand why it is important for people who may have contracted the infection from him to be told they may have it.

Then, offer to contact the patient's former and current partners. Fully explain each step in the notification process, assuring the patient that his name will not be revealed under any circumstances. Answer any questions and address any concerns about the notification process. If the patient is still reluctant to provide information, give him some time to think about it away from the office and follow up periodically with a phone call.

Once the patient agrees to reveal names, write down the names and other information, and preferably phone numbers. To make sure you have correct information, read it back to the patient, spelling each person's name in turn and reciting the phone number or address. Write down the phonetic pronunciations of any difficult names. Tell the patient when you will make the notifications.

You now are ready to contact these individuals. Professionals who work with STI patients recommend the following guidelines for contacting current and former partners to alert them about potential exposure to an STI. Note that these guidelines are applicable only to STIs other than AIDS. Determine how you will contact each individual: in writing, in person, or by phone.

1. If you use US mail, mark the outside of the addressed envelope "Personal." On a note inside, simply ask the person to call you at the medical office. Do not put the topic of the call in writing.

2. If you make the contact in person, ask where you can talk privately. Even if the person appears to be alone, others may still be able to overhear the conversation.
3. If you use the phone, identify yourself and your office and ask for the specific individual. Do not reveal the nature of your call to anyone but that person. If pressed, tell the person who answers the phone that you are calling regarding a personal matter.

Once on the phone or alone with the person, confirm that you are talking to the correct person. Mention that you wish to talk about a highly personal matter and ask if it is a good time to continue the discussion. If not, arrange for a more appropriate time. Inform the individual that she has come in contact with someone who has an STI and recommend that she visit a doctor's office or clinic to be tested for the infection.

Be prepared for a variety of reactions, from surprise to anger. Respond calmly and coolly. Expect to respond to questions and statements such as

- Who gave you my name?
- Do I have the disease?
- Am I really at risk? I haven't had intercourse recently (or) I've only had intercourse with my spouse.
- I feel fine. I just went to my doctor recently.

Let the person know that you cannot reveal the name of the partner because the information is strictly confidential. Assure the person that you will not reveal her name to anyone, either. Explain that exposure to the disease does not mean a person has contracted it. Encourage the person to get tested to know for sure.

Tell the person that she is still at risk, even if she hasn't had intercourse recently or has had it only with a spouse. Let the person know that someone with whom she came in close contact at some point has contracted the disease. Even if the person says, "I feel fine," she may still have the infection. Again, stress the importance of getting tested.

Provide your name and phone number for contact about further questions. Recommend local offices and clinics for testing, and provide phone numbers. If the person will come to your office, offer to make the appointment.

Finally, document the results of your call. Log in the original patient's file the date that you completed notification. Include any pertinent details about the notification. Alert the patient when all people on the list have been notified.

The AMA has several standard forms for authorization of disclosure and includes disclosure clauses in many other forms. For example, the consent-to-surgery form includes a clause about consenting to picture taking and

observation during the surgery. When using a standard form, cross out anything that does not apply in that situation. Medical practices often develop their own customized forms.

Medical ethics is a vital part of medical practice and following an ethical code is an important part of your job. Ethics deals with general principles of right and wrong, as opposed to requirements of law. A professional is expected to act in ways that reflect society's ideas of right and wrong, even if such behavior is not enforced by law. Often, however, the law is based on ethical considerations.

Bioethics: Social Issues

Bioethics deals with issues that arise related to medical advances. For many people, bioethical issues are particularly sensitive and highly personal issues. This may be true for you on a personal level as well. Remember that, as a medical assistant, you must remain nonjudgmental at all times regarding patient healthcare dilemmas and decisions. Here are three examples of bioethical issues.

1. A treatment for Parkinson's disease was developed that uses fetal tissue. Some women, upon learning about this treatment, might get pregnant just to have an abortion and sell the fetal tissue. Is this ethical?
2. If a couple cannot have a baby because of a medical condition of the mother, using a surrogate mother is an option some couples choose. The surrogate mother is artificially inseminated with the sperm of the husband and carries the baby to term. The couple then raises the child. Ethically speaking, who is the real mother, the woman who bears the child or the woman who raises the child? If the surrogate mother wants to keep the baby after it is born, does she have a right to do so?
3. When a liver transplant is needed by both a famous patient who has had a history of alcohol abuse and a woman who is a recipient of public assistance, what criteria are considered when determining who receives the organ? Who makes the decision? Ethically, treating physicians should not make the decision of allocating limited medical resources. Such decisions should consider only the likelihood of benefit, the urgency of need, and the amount of resources required for successful treatment. Nonmedical criteria such as ability to pay, age, social worth, perceived obstacles to treatment, patient's contribution to illness, or the past use of resources should not be considered.

Practicing appropriate professional ethics has a positive impact on your reputation and the success of your employer's business. As a result, many medical organizations have created guidelines for the acceptable and preferred manners and behaviors, or etiquette, of medical assistants and physicians.

The principles of medical ethics have developed over time. The Hippocratic oath, in which medical students pledge to practice medicine ethically, was developed in ancient Greece (see http://www.nlm.nih.gov/hmd/greek/greek_oath.html). It is still used today and is one of the original bases of modern medical ethics. Hippocrates, the 4th century B.C. Greek physician commonly called the "father of medicine," is traditionally considered the author of this oath, but its authorship is actually unknown.

Among the promises of the Hippocratic oath are to use the form of treatment believed to be best for the patient, to refrain from harmful actions, and to keep a patient's private information confidential.

The AMA defines ethical behavior for doctors in *Code of Medical Ethics: Current Opinions with Annotations* ([Use of 174 words from the American Medical Association's Code of Medical Ethics: Current Opinions and Annotation, found within the 2015 CPT Professional Edition. © American Medical Association [1995–2015].] All rights reserved.) Medical assistants as well as doctors need to be aware of these principles, some of which are included in italics here and explained as follows:

A physician shall be dedicated to providing competent medical service with compassion and respect for human dignity.

This means that medical professionals will respect all aspects of the patient as a person, including intellect and emotions. The doctor must decide what treatment would result in the best, most dignified quality of life for the patient, and the doctor must respect a patient's choice to forgo treatment.

A physician shall deal honestly with patients and colleagues and strive to expose those physicians deficient in character or competence or who engage in fraud or deception.

Medical professionals, including medical assistants, should respect colleagues, but they also must respect and protect the profession and public welfare enough to report colleagues who are breaking the law, acting unethically, or unable to perform competently. Dilemmas may arise where one suspects, but is not able to prove, for instance, that a coworker has a substance abuse problem or another problem that is affecting performance. Ignoring such a situation in medical practice could cost someone's life as well as lead to lawsuits.

In terms of billing, a doctor should bill only for direct services, not for indirect ones such as referrals. The doctor also should not bill for services that do not really pertain to the practice of medicine, such as dispensing drugs.

It is also unethical for the doctor to influence the patient about where to fill prescriptions or obtain other medical services when the doctor has a personal financial interest in any of the choices. For example, it can be considered a conflict of interest if a physician has ownership in a surgical center and refers patients to the center without disclosing this financial interest to the patient.

A physician shall respect the law and also recognize a responsibility to seek changes in requirements that are contrary to the patient's best interests.

Several legal or employer requirements have come under scrutiny as being contrary to a patient's best interests. Among them are discharging patients from the hospital after a certain time limit for certain procedures, which may be too soon for many patients. Insurance company payment policies have sometimes been criticized as unfair. So have health maintenance organization (HMO) financial policies that conflict with a doctor's treatment preference.

A physician shall respect the rights of patients, of colleagues, and of other health professionals and shall safeguard patient confidences within the constraints of law.

As previously mentioned, the Patient Care Partnership: Understanding Expectations, Rights and Responsibilities, originally established by the American Hospital Association in 1973 and revised in 1992, lists ethical principles protecting

the patient. Some states have even passed this code of ethics into law. Among a patient's rights are the right to information about alternative treatments, the right to refuse to participate in research projects, and the right to privacy.

A physician shall continue to study; apply and advance scientific knowledge; make relevant information available to patients, colleagues, and the public; obtain consultation; and use the talents of other health professionals when indicated.

Keeping up with the latest advancements in medicine is crucial for providing high-quality, ethical care. Most states require doctors to accumulate continuing education units to maintain a license to practice. These units are earned by means of educational activities such as courses and scientific meetings. As discussed in *The Profession of Medical Assisting* chapter, medical assistants who are certified by the AAMA or AMT have similar requirements by the sponsoring certification board to earn CEUs to maintain their credentialed status.

A physician shall, in the provision of appropriate patient care, except in emergencies, be free to choose whom to serve, with whom to associate, and the environment in which to provide medical services.

Ethically, doctors can set their hours, decide what kind of medicine to practice and where, decide whom to accept as a patient, and take time off as long as a qualified substitute performs their duties. Doctors may decline to accept new patients because of a full workload. In an emergency, however, a doctor is ethically obligated to care for a patient, even if the patient is not of the doctor's choosing. The doctor should not abandon that patient until another physician is available.

A physician shall recognize a responsibility to participate in activities contributing to an improved community.

This ethical obligation also holds true for the allied health professions. In addition to knowing the physician's codes of ethics, medical assistants should follow the code of ethics for their certifying body, be it the AAMA or the AMT. See the *Points on Practice* box for the AAMA's Code of Ethics and Figure 5-8 for the AMT's Standards of Practice.

► Legal Medical Practice Models LO 5.8

There are five basic types of medical practice:

- Sole proprietorship
- Partnership
- Group practice
- Professional corporation
- Clinics

Laws governing the types of practice vary, but medical office personnel should be aware of the laws that apply to their employers' practice management models.

Sole Proprietorship

This type of practice is often referred to as a "solo practice." In this type of practice, a physician practicing alone assumes all the benefits for and liabilities of the business. Sole proprietorship practice management is no longer a popular option, as a result of the increased expenses and decreased insurance reimbursements. So more physicians are joining group practices or professional corporations.

Partnership

When two or more physicians decide to practice together, they may form a partnership based on a legal contract that specifies the rights, obligations, and responsibilities of each partner. One advantage of partnerships is sharing the workload, expenses, profits, and assets. A disadvantage is that each partner has equal liability for acts of misconduct, losses, and deficits of the practice, unless specified otherwise in the contract.

Group Practice

Group practice is a medical practice model in which three or more licensed physicians share the collective income, expenses, facilities, equipment, records, and personnel for the practice. Physicians in group practice may be engaged in the same specialty, calling themselves, for example, Associates in Cardiology, or several physicians may offer similar specialties, such as OB/GYN and pediatrics.

POINTS ON PRACTICE

AAMA Code of Ethics

The Code of Ethics of the AAMA shall set forth principles of ethical and moral conduct as they relate to the medical profession and the particular practice of medical assisting.

Members of the AAMA dedicated to the conscientious pursuit of their profession, and thus desiring to merit the high regard of the entire medical profession and the respect of the general public which they serve, do pledge themselves to strive always to:

- A.** Render service with full respect for the dignity of humanity;
- B.** Respect confidential information obtained through employment, unless legally authorized or required by responsible performance of duty to divulge such information;
- C.** Uphold the honor and high principles of the profession and accept its disciplines;
- D.** Seek to continually improve the knowledge and skills of medical assistants for the benefit of patients and professional colleagues; and
- E.** Participate in additional service activities aimed toward improving the health and well-being of the community.

AMT Standards of Practice

The American Medical Technologists is dedicated to encouraging, establishing and maintaining the highest standards, traditions, and principles of the disciplines which constitute the allied health professions of the certification agency and the Registry.

Members of the Registry and all individuals certified by AMT recognize their professional and ethical responsibilities, not only to their patients, but also to society, to other health care professionals, and to themselves.

The AMT Board of Directors has adopted the following Standards of Practice which define the essence of competent, honorable and ethical behavior for an AMT-certified allied health care professional. Reported violations of these Standards will be referred to the Judiciary Committee and may result in revocation of the individual's certification or other disciplinary sanctions.

- I. While engaged in the Arts and Sciences that constitute the practice of their profession, AMT professionals shall be dedicated to the provision of competent and compassionate service and shall always meet or exceed the applicable standard of care.
- II. The AMT professional shall place the health and welfare of the patient above all else.
- III. When performing clinical duties and procedures, the AMT professional shall act within the lawful limits of any applicable scope of practice, and when so required shall act under and in accordance with appropriate supervision by an attending physician, dentist, or other licensed practitioner.
- IV. The AMT professional shall always respect the rights of patients and of fellow health care providers, shall comply with all applicable laws and regulations governing the privacy and confidentiality of protected healthcare information, and shall safeguard patient confidences unless legally authorized or compelled to divulge protected healthcare information to an authorized individual, law enforcement officer, or other legal or governmental entity.
- V. AMT professionals shall strive to increase their technical knowledge, shall continue to learn, and shall continue to apply and share scientific advances in their fields of professional specialization.
- VI. The AMT professional shall respect the law and pledges to avoid dishonest, unethical or illegal practices, breaches of fiduciary duty, or abuses of the position of trust into which the professional has been placed as a certified healthcare professional.
- VII. AMT professionals understand that they shall not make or offer a diagnosis or dispense medical advice unless they are duly licensed practitioners or unless specifically authorized to do so by an attending licensed practitioner acting in accordance with applicable law.
- VIII. The AMT professional shall observe and value the judgment of the attending physician, dentist, or other attending licensed practitioner, provided that so doing does not clearly constitute a violation of law or pose an immediate threat to the welfare of the patient.
- IX. AMT professionals recognize that they are responsible for any personal wrongdoing, and that they have an obligation to report to the proper authorities any knowledge of professional abuse or unlawful behavior by any party involved in the patient's diagnosis, care and treatment.
- X. The AMT professional pledges to uphold personal honor and integrity and to cooperate in protecting and advancing, by every lawful means, the interests of the American Medical Technologists and its Members.

(Revised by the AMT Board of Directors July 7, 2013)

FIGURE 5-8 AMT Standards of Practice.

AMT Standards of Practice: Reprinted with permission from American Medical Technologists.

Professional Corporations

A corporation is a body formed and authorized by state law to act as a single entity. Physicians who form corporations are shareholders and employees of the organization. Forming a corporation has financial and tax advantages, and the fringe

benefits for employees may be greater than in a sole proprietorship or partnership.

In forming a corporation, the incorporators and owners have limited liability in lawsuits. Some medical practices are managed by for-profit corporations that are formed by outside

business interests or subsidiary corporations organized by hospitals. Physicians are hired as salaried employees with bonus options. The management corporation provides the facility, office personnel, employee benefits, human resource services, and operating expenses.

Clinics

Patients can be admitted to clinics for special circumstances and research. In many cases, clinics are hard to distinguish from large medical facilities.

Clinics are broad in their range of specialties and subspecialties, and many have sophisticated medical equipment and renowned medical practitioners. Clinics may be housed inside of a hospital or be free-standing. Urgent care centers, also known as walk-in clinics, exist so that patients have the option of being seen without an appointment.

In-store clinics are becoming more prevalent. Housed in large major chain stores and sometimes in chain pharmacies, they offer smaller medical services such as flu shots, other vaccinations, and eye exams.

Employment Law

Many medical assistants find themselves promoted into supervisory and managerial positions. Knowledge of employment and labor laws like those involving civil rights, sexual harassment, employment of persons with disabilities, fair labor laws, and family medical leave are important to all employees, but particularly so for those who oversee other employees. Labor and employment laws are covered in detail in the *Practice Management* chapter.

PROCEDURE 5-1 Obtaining Signature for Notice of Privacy Practices and Acknowledgment

WORK // DOC

Procedure Goal: To follow HIPAA guidelines and obtain the patient's signature that he or she has received and understands the office privacy policies

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Preprinted Notice of Privacy Practices and Acknowledgment (see Figure 5-5), pens, and a copy machine

Method:

1. Explain to the patient the office privacy policy regarding protected health information.
RATIONALE: *Some patients understand the spoken word more easily than the written word.*
2. Ask the patient to read the policy carefully and to feel free to ask any questions he may have regarding the policy. Answer any questions that arise.

RATIONALE: *Patients must have a thorough understanding in order to acknowledge receipt of the privacy policy.*

3. When the patient's questions have been answered, witness the patient (or guardian) sign and print his name. Note any restrictions placed on the document.

RATIONALE: *Restrictions must be noted so inadvertent release of information does not occur.*

4. Print your name and sign the document as witness, including your title.
5. Date the document when all signatures have been completed.
6. Make a copy of the document to file in the patient medical record and give the original to the patient.
RATIONALE: *It is important that copies of all signed documents are in the patient's record in case of any legal proceedings that arise.*

PROCEDURE 5-2 Completing a Privacy Violation Complaint Form

WORK // DOC

Procedure Goal: To assist the patient in completing a Privacy Violation Complaint form if she feels her PHI has been compromised.

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Privacy Violation Complaint form (see Figure 5-6), pens, private room to complete form, and a copy machine

Method:

1. Explain to the patient that all formal complaints must be made in writing.

RATIONALE: *This provides legal documentation in case it is ever needed in court.*

2. Ask the patient if she feels assistance will be needed completing the form. If not, the patient may complete the form on her own. Answer any questions she may have regarding completion of the form.
3. When the patient completes the form, read it carefully, making sure it is complete and legible and the information regarding the breach of privacy is clear.

RATIONALE: *In order to address the alleged breach, a thorough understanding of the complaint is needed.*

4. If the patient requires that any copies be made for documentation backing the claim, make the copies, returning any originals to the patient.
5. Make sure the patient signs and dates the complaint.
6. As the person receiving the complaint, sign the document as indicated and date it.

7. Explain to the patient that the office will respond to the complaint within 30 days of today's receipt.
8. Make a copy of the document for the patient and keep the original for the office files.

RATIONALE: *Copies of all legal documents must be kept on file.*

PROCEDURE 5-3 Obtaining Authorization to Release Health Information

WORK // DOC

Procedure Goal: To follow HIPAA guidelines when obtaining the patient's protected health information without violating confidentiality regulations

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Preprinted Authorization to Release Health Information form (see Figure 5-7), pens, and a copy machine

Method:

1. Explain to the patient the need for the requested medical information.
RATIONALE: *In order for the consent to be valid, the patient must understand the need for the release of information.*
2. Obtain the name and address of the practice to which the authorization is to be mailed.
3. Fill in the patient's name, address, and DOB as required.
4. Enter the physician's or practitioner's name from your practice who is requesting the PHI.
5. Enter the information that is being requested.
RATIONALE: *Only the required information may be requested and released to the practice.*

6. Complete the reason for request, explaining why the patient is requesting the information be sent to your office.
RATIONALE: *To comply with HIPAA guidelines, a reason for the record release is necessary.*
7. Enter an expiration date for the authorization, giving a reasonable amount of time for the request to be fulfilled.
8. Prior to signing the release, go over with the patient the information contained within the release, answering any questions that arise. Be sure the patient understands the request may be withdrawn (in writing) at any time.
9. Witness the patient (or guardian) signature and date; if necessary, be sure the guardian relationship area is completed.
10. Sign and date the document as witness, including your title.
11. Make a copy of the document to file in the patient medical record and, if requested, give a copy to the patient.
RATIONALE: *The release is a legal document and must be kept with the patient medical record.*
12. Make a notation in the medical record of the document signing and note the date the authorization is mailed.
RATIONALE: *If the records are not received in a timely manner, the office will need to be contacted.*

SUMMARY OF LEARNING OUTCOMES	
LEARNING OUTCOMES	KEY POINTS
5.1 Differentiate between laws and ethics.	A law is a rule of conduct or action prescribed or formally recognized as binding or enforced by local, state, or federal government. Ethics are standards of behavior or concepts of right or wrong beyond what the legal consideration is in any given situation.
5.2 Identify the responsibilities of the patient and physician in a physician-patient contract, including the components for informed consent that must be understood by the patient.	Physician responsibilities in a physician-patient contract include using due care, skill, judgment, and diligence in treating the patient; staying informed of the current diagnosis and treatment; performing to the best of the physician's ability; and providing complete information and instructions to the patient. Regarding informed consent, the physician must provide the following information: proposed treatment modes; why the treatment is necessary; risks of the proposed treatment; alternative treatments available; risks of the alternatives; and the risks if all treatment is refused.

LEARNING OUTCOMES	KEY POINTS
	Patient responsibilities in a physician-patient contract include following instructions given by the provider and cooperating as much as possible; giving relevant information to the provider; following physician instructions for treatment; and paying fees for services provided.
5.3 Describe the four Ds of negligence required to prove malpractice and explain the four Cs of malpractice prevention.	The four Ds of malpractice are duty—it must be proven that a physician-patient relationship exists; derelict—it must be proven that the physician failed to comply with standards of the profession; direct cause—it must be proven that any damages were directly caused by the physician’s breach of duty; and damages—it must be proven that the patient suffered an injury. The four Cs of medical malpractice prevention are caring—the most important asset; communication—which earns respect and trust; competence—which proves abilities by maintaining and updating knowledge; and charting—which documents all aspects of patient interaction.
5.4 Relate the term credentialing and explain the importance of the FDA and DEA to administrative procedures performed by medical assistants.	The term <i>credentialing</i> refers to the approval process a healthcare provider must go through to be allowed to bill Medicare and other insurance carriers for providing medical services to patients under their insurance plans. Often, the medical assistant is in charge of submitting the required paperwork and documentation for the provider to gain this approval. The Food and Drug Administration (FDA) approves drugs for use on humans. It also regulates whether drugs are prescription-based or accessible OTC. The Drug Enforcement Agency (DEA) is responsible for controlling and overseeing the prescribing of controlled substances. Physicians must obtain and renew their license with the DEA in order to prescribe controlled substances.
5.5 Summarize the purpose of the following federal healthcare regulations: HCQIA, False Claims Act, OSHA, and HIPAA.	Congress enacted HCQIA in 1996 because it found that there was an increasing occurrence of medical malpractice and a need to improve the quality of medical care. The False Claims Act allows individuals to bring civil <i>qui tam</i> actions on behalf of the US government for false claims made to the federal government. OSHA created federal laws to protect healthcare workers from health hazards on the job. Title I of HIPAA was created so that employees could still have access to health insurance coverage when leaving employment for any reason. Title II was created to protect patients’ individually identifiable personal information as well as their personal health information. It also allows patients access to their medical information on request and allows them to limit the sharing of that information. Additionally, patients on written request must be allowed to see a record of how their PHI has been shared and with whom.
5.6 Identify the six principles for preventing improper release of information from the medical office.	The six rules for preventing improper release of information include the following: (1) When in doubt about whether to release information, it is better not to release it. (2) It is the patient’s right, not the physician’s, to keep patient information confidential. (3) All patients should be treated with the same degree of confidentiality. (4) Be aware of all applicable laws and of the regulations of agencies involved with confidentiality. (5) When it is necessary to break confidentiality and when there is a conflict between ethics and confidentiality, discuss it with the patient. The physician may need to make the final decision. (6) Get written approval from the patient before releasing information.

LEARNING OUTCOMES	KEY POINTS
5.7 Discuss the importance of ethics in the medical office.	Ethics reflects the general principles of right and wrong. A professional, particularly a medical professional, is expected to follow especially high ethical standards.
5.8 Explain the differences among the practice management models.	There are five basic types of practice management models: (1) sole proprietorship (one physician), (2) partnership (two or more physicians), (3) group practice (three or more physicians), (4) professional corporation (a body formed and authorized by state law to act as a single entity; physicians are stakeholders and employees of the organization), and (5) clinics.

CASE STUDY CRITICAL THINKING

© Red Chopsticks/Getty Images RF

Recall Cindy Chen from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding her case.

1. How will you respond to the extern's concerns?
2. Once Cindy becomes a phlebotomist, how should the information regarding her HIV-positive status be handled? Will the situation change if she develops AIDS?

EXAM PREPARATION QUESTIONS

1. (LO 5.1) A standard of behavior with a concept of right and wrong beyond the legal considerations is called
 - a. Civil law
 - b. Moral values
 - c. Medical ethics
 - d. Etiquette
 - e. Ethics
2. (LO 5.1) The two types of law that pertain to healthcare professionals are
 - a. Contract law and agency law
 - b. Civil law and criminal law
 - c. Civil law and medical law
 - d. Litigation and malpractice
 - e. Contract law and medical negligence
3. (LO 5.2) The physician's responsibility within the physician-patient contract includes all of the following *except*
 - a. Setting up a practice within the boundaries of his or her license to practice medicine
 - b. Setting up an office where he or she chooses and establishes office hours
 - c. Determining whether to specialize
 - d. Deciding which services to provide and how those services will be provided
 - e. Treating every patient seeking care
4. (LO 5.3) Cases in which a person believes that a medical professional did not perform an essential action or performed an improper one, thus harming the patient, may result in
 - a. Charges of slander
 - b. Charges of medical negligence
 - c. Charges of abandonment
 - d. Charges of defamation
 - e. Charges of fraud

5. (LO 5.3) Under the _____, words uttered to a patient by the medical assistant can be said to be the responsibility of the employer-physician.
 - a. Law of agency
 - b. Employee contract
 - c. Civil law
 - d. Criminal law
 - e. Ethical considerations
6. (LO 5.4) The process used by various organizations, including insurance carriers, to ensure that healthcare providers are appropriately qualified to provide services and meet all the necessary requirements to do so is called
 - a. Arbitration
 - b. *Qui tam*
 - c. Credentialing
 - d. Subpoena
 - e. Tort
7. (LO 5.5) Which of the federal acts was passed by Congress to improve the quality of medical care nationwide?
 - a. HIPAA Title I
 - b. HIPAA Title II
 - c. OSHA
 - d. HCQIA
 - e. False Claims Act
8. (LO 5.6) Incidents and diseases, although normally considered confidential, that must be reported to federal, state, or local agencies come under the heading of
 - a. Medical ethics
 - b. HIPAA security rule
 - c. STIs and AIDS
 - d. Mandatory disclosure
 - e. Civil law
9. (LO 5.7) Issues relating to medical advances come under the heading of
 - a. Ethics
 - b. Bioethics
 - c. Religious freedoms
 - d. Misfeasance
 - e. Malfeasance
10. (LO 5.8) Which practice model provides the most legal protection for the physicians who form the practice?
 - a. Sole proprietorship
 - b. Partnership
 - c. Group practice
 - d. Professional corporation
 - e. Clinics

SOFT SKILLS SUCCESS

You are a medical assistant at the family practice office of Dr. Janice Parrish. Elizabeth James and her daughter Anne have been patients at the practice for 10 years. Anne is 20 years old. Elizabeth is in the office for a blood pressure check. While you are taking her blood pressure, she tells you that Anne was in to see Dr. Parrish last week. She also says that she thinks Anne has been acting strangely and asks you if her daughter is pregnant. How would you respond

to Elizabeth? What can you legally tell Elizabeth about her daughter?

CASE STUDY

PATIENT INFORMATION	Patient Name	DOB	Allergies
	Shenya Jones	11/3/19XX	Cinnamon, peanuts
	Attending	MRN	Other Information
	Elizabeth Williams, MD	124-86-564	Wound C&S sent to Laboratory Services

Shenya Jones, a 34-year-old female, arrives at the office with a swelling and a red pustule on her face. She states the problem started 2 days ago as a small pimple near her nose. It became irritated, then became extremely swollen and painful overnight. Now this morning there was yellow drainage noted at the site and the swelling has increased. The area of drainage is approximately 1 cm in diameter. The upper lip, side

© McGraw-Hill Education

of the face, and nose are all swollen. She rates the pain in her face as 7 out of 10. The physician thinks the condition may be impetigo or methicillin-resistant *Staphylococcus aureus* (MRSA), a type of skin infection that is resistant to the common antibiotics used to treat it. Dr. Williams will culture the wound to find out what type of microorganisms are present and what specific antibiotics could be used to treat the infection.

Keep Shenya in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

 **ACTIVSim**

LEARNING OUTCOMES

After completing Chapter 6, you will be able to:

- 6.1** Identify OSHA's role in protecting healthcare workers.
- 6.2** Illustrate the cycle of infection and how to break it.
- 6.3** Summarize the Bloodborne Pathogens Standard and universal precautions as described in the rules and regulations of the Occupational Safety and Health Administration (OSHA).
- 6.4** Describe how transmission-based precautions supplement standard precautions.
- 6.5** Summarize OSHA's education and training requirements for ambulatory care settings.

KEY TERMS

- | | |
|--|--|
| alcohol-based hand disinfectants (AHD) | healthcare-associated infections (HAI) |
| asepsis | pathogen |
| carrier | reservoir host |
| endogenous infection | standard precautions |
| engineered safety devices | susceptible host |
| exogenous infection | transmission-based precautions |
| fomite | vector |
| general duty clause | work practice controls |

- III.C.2** Describe the infection cycle including:
 - (a) the infectious cycle
 - (b) reservoir
 - (c) susceptible host
 - (d) means of transmission
 - (e) portals of entry
 - (f) portals of exit
- III.C.3** Define the following as practiced within an ambulatory care setting:
 - (a) medical asepsis
 - (b) surgical asepsis
- III.C.4** Identify methods of controlling the growth of microorganisms
- III.C.5** Define the principles of standard precautions
- III.C.6** Define personal protective equipment (PPE) for:
 - (a) all body fluids, secretions, and excretions
 - (b) blood
 - (c) non-intact skin
 - (d) mucous membranes
- III.C.7** Identify Center for Disease Control (CDC) regulations that impact healthcare practices
- III.P.1** Participate in bloodborne pathogen training
- III.P.2** Select appropriate barrier/personal protective equipment (PPE)
- III.P.3** Perform handwashing

4. Medical Law and Ethics

- f. Comply with federal, state, and local health laws and regulations as they relate to healthcare settings

9. Clinical Procedures

- a. Practice standard precautions and perform disinfection/sterilization techniques

10. Medical Laboratory Procedures

- c. Dispose of biohazardous materials

► Introduction

From whooping cough in California to Ebola in West Africa, it is hard to open a newspaper or newsfeed without reading about an outbreak of disease. Despite all the medical advances of the modern world, humans continue to contract infectious diseases. As a medical assistant, you play an important role in stopping the spread of infections. In this chapter, you will be introduced to the fundamentals of infection control, including OSHA's role in protecting healthcare workers, the cycle of infection, OSHA Bloodborne Pathogens Standard, standard precautions, transmission-based precautions, and OSHA-required education and training for healthcare workers.

► Occupational Safety and Health Administration

LO 6.1

The Occupational Safety and Health Administration's (OSHA) mission is to "assure safe and healthful working conditions for working men and women by setting and enforcing standards

and by providing training, outreach, education and assistance." Healthcare workers face safety challenges specific to caring for the sick and injured. For this reason, the Centers for Disease Control and Prevention (CDC) works closely with OSHA to ensure that these workers have documented best practices to follow. The CDC makes recommendations and guidelines regarding specific health and safety practices, and OSHA makes and enforces regulations based on these recommendations and guidelines. Copies of these guidelines can be obtained from many sources, including local OSHA offices; the CDC in Atlanta, Georgia; many industrial organizations throughout the country; and the Internet.

If a specific standard exists, its guidelines must be followed; however, if no specific standard has been developed, the **general duty clause** takes effect. This clause requires an employer to maintain a workplace free from hazards that are recognized as likely to cause death or serious injury. For example, all employers are expected to ensure that all exits are clear of obstacles and unlocked when the building is occupied. If an employer blocks a fire exit, a fire breaks out, and employees are injured because they are unable to safely leave the building, the employer has violated the general duty clause.

Employer Responsibilities

Employers have a legal responsibility to provide a safe working environment. In order to fulfill this responsibility, employers must

- Ensure that the workplace is free from serious recognized hazards and comply with Occupational Safety and Health rules and regulations.
- Inspect workplace conditions, confirming they conform to OSHA standards.
- Provide safe and properly maintained equipment.
- Maintain operating procedures and communicate new and updated procedures to employees.
- Provide accessible safety training to all workers.

Employee Responsibilities

Healthcare workers must follow regulations related to workplace safety, including chemical exposure, fire safety, electrical safety, and ergonomics and physical safety (see the chapter *Safety and Patient Reception*). In order to protect yourself, your coworkers, and your patients, you must follow the procedures, guidelines, and regulations outlined in your facility's infection control plan. Before you can understand the elements of an infection control plan, you must first understand how infections are transmitted.

▶ The Cycle of Infection

LO 6.2

As a medical assistant, your role in helping to create and maintain a safe and healthy environment for both patients and employees is key. This role includes understanding how infections occur and are transmitted in the population and practicing all necessary infection control precautions. To understand how infections are spread, you need to understand the cycle of infection.

Five elements make up the cycle of infection (Figure 6-1). These five parts must all be present for infection to occur:

1. Reservoir host
2. Means of exit
3. Means of transmission
4. Means of entrance
5. Susceptible host

Reservoir host

The infection cycle begins when the **pathogen** invades the reservoir host. The **reservoir host** is an animal, an insect, or a human whose body is capable of sustaining the growth of a pathogen. Many pathogens require a reservoir host to provide nutrition and a place to multiply.

The presence of the pathogen in the reservoir host may cause an infection in the host. At times, however, the host avoids full infection. A human **carrier** is a reservoir host who is unaware of the presence of the pathogen and so spreads the disease. The carrier exhibits no symptoms of infection. A human host also may have a subclinical case, which is a

FIGURE 6-1 The cycle of infection must be broken at some point to prevent the spread of disease caused by pathogens.

manifestation of the infection that is so slight that it is unnoticeable. The host experiences only some of the symptoms of the infection or milder symptoms than in a full case. A wide range of diseases can be manifested subclinically.

An infection in the reservoir host may be either endogenous or exogenous. An **endogenous infection** is one in which an abnormality or a malfunction in routine body processes has caused normally beneficial or harmless microorganisms to become pathogenic. A bladder infection caused by *Escherichia coli* bacteria (commonly known as *E. coli*) is an endogenous infection. *E. coli* are beneficial bacteria normally found in the intestinal tract, but when introduced into the bladder via the urethra, *E. coli* can cause a bladder infection. An **exogenous infection** is one that is caused by the introduction of a pathogen from outside the body. A wound infection that occurs as the result of a healthcare worker transferring staph bacteria from her hands to a surgical site is an example of an exogenous infection.

Means of Exit

The next step in the cycle of infection is the pathogen's exiting from the reservoir host. Common routes of exit include

- Through the nose, mouth, eyes, or ears.
- In feces or urine.
- In semen, vaginal fluid, or other discharge through the reproductive tract.
- In blood or blood products from open wounds.

Means of Transmission

To reproduce after it has exited from the reservoir host, the pathogen must spread to another host by some means

CAUTION: HANDLE WITH CARE

Respiratory Hygiene and Cough Etiquette

With the recent increase in widespread respiratory disease outbreaks like severe acute respiratory syndrome (SARS) and H1N1 influenza, the CDC identified the need to establish a set of guidelines to protect patients and their families in the health-care setting. These guidelines include

- Educating healthcare workers, patients, and their families about cough etiquette.
- Posting cough etiquette signs.
- Posting signs reminding patients to report flu symptoms.
- Controlling the source of transmission by covering coughs with a tissue and properly disposing of the tissue.
- Coughing or sneezing into your elbow or sleeve if no tissue is available.
- Using proper hand hygiene consistently.
- Separating patients with respiratory infections so they are at least 3 feet away from other patients in waiting areas or asking them to wear a mask.

of transmission, either direct or indirect. Direct transmission occurs when the pathogen moves immediately from one host to another (through contact with the infected person or with the discharges of the infected person, such as saliva or blood).

Indirect transmission is possible only if the pathogen is capable of existing independently of the reservoir host. In this case, the pathogen survives until a new host encounters it and the pathogen takes up residence in that new host.

Airborne Transmission Pathogens can be transmitted to a new host through the air. For example, microorganisms may enter the respiratory tract of a new host by inhalation. Respiratory diseases such as influenza, or flu, are often transmitted this way.

Pathogens may be inhaled from a variety of sources, such as soil particles or secretion droplets from a sneeze or cough. When people inhale contaminated soil particles, fungal diseases may be contracted. If contaminated droplets are inhaled, diseases including influenza, chickenpox, and tuberculosis may be contracted. Because pathogens can spread relatively rapidly through airborne transmission, they may cause large epidemics among susceptible people. See the feature *Caution: Handle with Care* for more information on respiratory hygiene and cough etiquette.

Bloodborne Transmission Pathogens also can enter a new host through contact with blood or blood products. Bloodborne pathogens may be transmitted in a variety of ways:

- Indirectly—when pathogens are transferred through blood transfusions, needlesticks, or improperly sterilized dental equipment
- Directly—when the contaminated blood of one person comes into contact with another person's broken skin or mucous membrane, or when a pregnant woman transmits a disease to her fetus across the placenta

Transmission During Pregnancy or Birth If a mother becomes infected during her pregnancy, she can pass

on pathogens to the fetus. An infection may be transmitted while the fetus is in the mother's uterus, which may result in damage to the fetus. This transmission is a form of bloodborne transmission.

Some bloodborne infections that produce only mild symptoms in the mother may be devastating to the fetus (for example, rubella). Other infections, such as herpes, gonorrhea, syphilis, or streptococcal infections, may infect the baby during passage through the birth canal. An infection that is present in a child at the time of birth is said to be congenital.

Foodborne Transmission A new host may be exposed to pathogens by ingesting contaminated food or liquids. Food can become contaminated when it is handled by an infected person who has poor hygiene habits, such as a customer at a self-service salad bar who did not wash his hands. The amount of contamination needed in a food to make someone ill varies. People who produce less stomach acid may become infected with a smaller dose of pathogens than those with higher acid production because stomach acid kills many microorganisms. An example of a pathogen transmitted by ingestion is a strain of *E. coli*, which can cause severe food poisoning.

Vector-Borne Transmission A living organism that carries microorganisms from an infected person to another person is known as a **vector**. The most common carriers are insects such as fleas, flies, mosquitoes, and ticks.

- Fleas carry the organism responsible for plague. Though the number of cases in the United States is very low, plague has been identified as a possible bioterrorism agent.
- Common houseflies carry pathogens from garbage and feces on their bodies and feet. When they land on food, they mechanically transfer these microorganisms to the food.
- Mosquitoes are carriers of several diseases of importance in the United States. They carry the organisms responsible for West Nile virus and malaria.

- Ticks carry the microorganisms responsible for Lyme disease and Rocky Mountain spotted fever.

Transmission by Touching Direct or indirect contact through touch is another method of transmitting infection. Direct transmission occurs through contact with an infected person's mucous membranes. Sexually transmitted infections are spread through the direct contact of one mucous membrane with another (in the penis, vagina, urethra, mouth, or anus) during sexual activity.

Indirect transmission occurs through contact with **fomites**. A fomite is any inanimate reservoir of pathogenic microorganisms. Examples of fomites include drinking glasses, door-knobs, shopping cart handles, pencils, and almost any surface or object that can temporarily hold microorganisms. So any object that can be contaminated by an infected person and then can transmit the infective agent to a susceptible host is considered a fomite.

Means of Entrance

Just as the pathogen needs a means of exit from the reservoir host, it also needs a means of entrance into the new host. Pathogens can enter a new host through any cavity lined with mucous membrane, such as the mouth, nose, throat, vagina, or rectum. They also can enter through the ears, eyes, intestinal tract, urinary tract, reproductive tract, or breaks in the skin. Most pathogens can take advantage of any means of exit and entry. For example, the droplets from an infected child's sneeze can land on a toy in a common play area. The next child to pick up the toy can transfer the infected droplets to her own nose, spreading the infection.

Susceptible Host

A final requirement must be met for the infection cycle to remain intact. The person into whom the pathogen has been transmitted must be an individual who has little or no immunity to infection by that organism. This individual is called a **susceptible host**.

Susceptibility is determined by a variety of factors—some related to the host, some to the pathogen, and some to the environment. Factors related to the host include the following:

- Age
- Genetic predisposition to certain illnesses
- Nutritional status
- Other disease processes
- Stress levels
- Hygiene habits
- General health

Factors related to the pathogen include the number and concentration of pathogens, the strength (virulence) of the pathogen, and the point of entry. Environmental factors, such as the host's living conditions and exposure to hazardous substances, also affect susceptibility.

Once a new host has been infected, the cycle can continue. This host becomes the reservoir host and eventually transmits the pathogen to yet another host.

Environmental Factors in Disease Transmission

The climate, food, water, animals, insects, and people in a community may greatly influence the types and courses of infection that exist there. In a highly dense population, the infection rate may be higher than in a low-density population because pathogens spread more quickly from person to person when people are in closer proximity. Proximity is one reason for the increase in respiratory disease during seasons when people are indoors for long periods.

Animals can also play a role in infection, as infections related to pathogens are found in domestic and wild animals. Unpasteurized milk from an infected cow may cause disease. Some pathogens can infect both animals and people. Butchers, hunters, and people in occupations dealing with animals may be at greater risk than other individuals for infection by those pathogens.

The environment affects the incidence of diseases carried by insects. Whether a potentially disease-carrying insect is in a certain area depends on whether that area has the appropriate climate and environment the insect needs to live. For instance, ticks may carry Rocky Mountain spotted fever or Lyme disease.

Economic and political factors also influence the pattern of infection transmission. They help determine the cleanliness of an area, the availability of medical care, and people's knowledge about preventing infection. Other factors that influence infection transmission include the availability of transportation, urbanization, population growth rates, and sexual behavior.

Breaking the Cycle

The principles of **asepsis** must be applied to break the cycle of infection and its spread. Asepsis is the condition in which pathogens are absent or controlled. For example, killing all microorganisms by sterilizing a suture removal kit and reducing the number of microorganisms on your hands by thoroughly washing them are types of aseptic practice. In medical settings, where many people are hosts to pathogens and many others are susceptible, asepsis can break the cycle by preventing the transmission of pathogens.

Specific measures to help break the cycle of infection include

- Maintaining strict housekeeping standards to reduce the number of pathogens present.
- Adhering to government guidelines to protect against diseases caused by pathogens.
- Educating patients in hygiene, health promotion, and disease prevention.

Hand Hygiene

Transmission by touching is the most common means of transmitting pathogens. The single most important aseptic procedure for a medical assistant is proper hand hygiene. The two most common methods of hand hygiene in the medical office are handwashing with plain or antimicrobial soap and

water and hand disinfection with alcohol-based hand disinfectants (AHD). Consistent hand hygiene using appropriate methods protects the patient, your coworkers, and you from healthcare-associated infections.

Handwashing Aseptic handwashing removes accumulated dirt and microorganisms that could cause infection under the right conditions. Procedure 6-1 describes how to perform aseptic handwashing. In most cases, plain soap and water are adequate. There is some evidence that overuse of antimicrobial soap leads to antibiotic-resistant pathogens. For this reason, only use antimicrobial soap after assisting with exams and procedures where body fluids are present.

Alcohol-Based Hand Rubs An alternative to handwashing is the use of **alcohol-based hand disinfectants (AHD)**. These are gels, foams, or liquids that have an alcohol content of 60% to 95%. AHD are the preferred method of routine decontamination and may be safely used in most situations; however, conditions in which they should not be used include

- When hands are visibly dirty or contaminated.
- Before and after eating.
- After using the bathroom.
- If you suspect you have come in contact with spore-forming bacteria.

A number of factors can affect the effectiveness of AHD:

- The type of alcohol used
- The concentration of alcohol
- Whether the hands are wet when the product is applied
- The contact time
- The amount used

If your hands feel dry before the recommended amount of time has passed, you most likely did not use enough. You should reapply the AHD using a larger amount. Procedure 6-2 describes the proper use of an alcohol-based hand disinfectant.

FIGURE 6-2 Chipped nail polish has a much higher bacteria count than natural, unpolished nails.

© Medioimages/Photodisc/Getty Images RF

Fingernail Length Fingernails are a haven for pathogens. There is ample documentation that a large number of bacteria and some types of yeast can be cultured from underneath and around the nail, especially right next to the border of the skin and the nail. The CDC recommends that natural nail length be less than 1/4 inch.

Nail Polish and Artificial Nails The use of nail polish and artificial nails is discouraged in healthcare workers, as there is enough evidence that nail polish and artificial nails harbor pathogens. Although freshly applied nail polish has not been shown to contain increased numbers of bacteria and more research is needed, polish that is chipped has a much higher bacteria count than natural, unpolished or freshly polished nails (Figure 6-2). Healthcare workers who wear artificial nails or extensions have more gram-negative bacteria on their fingers than healthcare workers with natural nails. These increases are seen both before and after handwashing. The CDC recommends that healthcare workers not wear artificial nails or extensions when working with high-risk patients. The World Health Organization (WHO) recommends that healthcare workers not wear artificial nails when working with any patients.

► OSHA Bloodborne Pathogens Standard and Universal Precautions LO 6.3

You must know the laws that require basic practices of infection control, also called infection prevention, in a medical office and how to apply these laws in your office. Federal regulations related to infection control and asepsis were developed by the Department of Labor's Occupational Safety and Health Administration and described in the OSHA Bloodborne Pathogens Standard of 1991. These laws protect healthcare workers from health hazards on the job, particularly from accidentally acquiring infections. They also help protect patients and any other people who come into the medical office.

OSHA Bloodborne Pathogens Standard

To ensure that biohazardous materials do not endanger people or the environment, laws set forth in the OSHA Bloodborne Pathogens Standard of 1991 dictate how you must handle infectious or potentially infectious waste generated during medical or surgical procedures. According to these rules, any potentially infectious waste materials must be appropriately discarded or held for processing in biohazardous waste containers. These wastes include the following:

- Blood products
- Body fluids
- Human tissues
- Cultures

- Vaccines (special preparations administered to produce immunity)
- Table paper, linen, towels, and gauze containing body fluids
- Used scalpels, needles, sutures with needles attached, and other sharp instruments (known as sharps)
- Specula
- Inoculating loops
- Used gloves, disposable instruments, cotton swabs, and disposable applicators

Many medical offices use only disposable paper gowns, drapes, coverings, and towels. Some offices, however, use cloth linens, which must be laundered. Certain rules apply to the laundering of cloth linens that are soiled with potentially infectious materials.

Medical offices use outside, licensed waste management services approved by the Environmental Protection Agency (EPA) to dispose of medical waste. A waste management service can provide instructions for preparing items before they are taken away.

The disposition and handling of contaminated sharps are of special concern because these instruments can easily puncture the skin and expose you to extremely dangerous viruses. Used sharps must never be bent, broken, recapped, or otherwise tampered with. After use, place them in a rigid, leakproof, puncture-resistant biohazardous waste container for sharps. Procedure 6-3 demonstrates the correct method for using a biohazardous sharps container. Disposable and reusable sharps are kept in separate containers. Metal basins containing disinfectant are often used to store reusable sharps until they can be processed. The outside waste management company may supply containers for the disposable items, sterilize them on its premises, and discard them in the city trash dump or incinerate them. See the *Caution: Handle with Care* section for a discussion of the guidelines you must follow when disposing of biohazardous waste and potentially infectious laundry waste.

OSHA's laws for hazardous waste disposal, as well as other OSHA regulations about measures to prevent the spread of infection, provide a margin of safety, ensuring that medical facilities meet at least the minimal criteria for asepsis. These laws include requirements for training personnel, keeping records, housekeeping, wearing protective gear, and other measures.

Although federal laws exist, individual states have some discretion in applying them. You should become familiar with the laws in your state to ensure that you are helping your medical office comply. Any outside cleaning service used by the office also should be made aware of these standards. Penalties for failing to comply with regulations can be severe (see Table 6-1).

To be in compliance with the Bloodborne Pathogens Standard, an employer must meet these requirements:

- A written OSHA Exposure Control Plan must be created and updated annually or whenever procedures that require exposure to potentially contaminated material are added or changed. The plan must be available to all employees and to authorized OSHA authorities.
- Training must be provided to all employees describing the documentation mandated by the standard. This

TABLE 6-1 Infectious Waste Disposal: Penalties for Not Following Regulations, as Set Forth by OSHA

Type of Violation	Characteristics of Violation	Penalties for Violation
Other than serious violation	Direct relationship to job safety and health but would probably not result in death or serious physical harm	Fine of up to \$7,000 (discretionary)
Serious violation	Substantial probability that death or serious physical harm could result; employer knew, or should have known, of the hazard	Fine of up to \$7,000 (mandatory)
Willful violation	Violation committed intentionally and knowingly	Fine of up to \$70,000 with a \$5,000 minimum; if violation resulted in death of employee, additional fine and/or up to 6 months' imprisonment
Repeated violation	Substantially similar (but not the same) violation found upon re-inspection; not applicable if initial citation is under contest	Fine of up to \$70,000
Failure to correct prior violation	Initial violation not corrected	Fine of up to \$7,000 for each day the violation continues past the date it was supposed to stop

documentation includes the symptoms, methods of transmission, and epidemiology of infectious diseases caused by bloodborne pathogens. Employees must also be instructed in the use of personal protective equipment, universal precautions, and engineering controls designed to prevent exposure. Procedures to follow in the event of exposure or emergency situations also must be part of the training. New employee training is required before the worker can perform a task that might pose a risk of occupational exposure and then on a yearly basis. Additional training is required when a new task or procedure is introduced that may change the employees' occupational exposure risk.

- The employer must make the hepatitis B vaccine available at no charge to all employees who are at risk for occupational exposure. Employees must either receive the vaccination or decline it in writing. The employer must maintain documentation of vaccinations and refusals. Employees who initially decline the vaccine are free to reverse their decision at any point during their employment.

Universal Precautions

OSHA requires medical professionals to follow specific "universal blood and body fluid precautions" as set forth by the

CAUTION: HANDLE WITH CARE

Proper Use of Biohazardous Waste Containers and Handling of Infectious Laundry Waste

Biohazardous waste containers are available in a variety of designs. Frequently, more than one design is used in the clinical setting. These containers are often provided by outside sterilization and waste management companies. Examples of biohazardous waste containers include

- Bags or containers that are red or have a biohazardous waste label (for any material contaminated with blood or body fluids, such as used dressings or gloves).
- Boxes with biohazardous waste labels (sometimes lined with red bags and used for disposable gowns, examination table covers, and similar items that may be contaminated with blood or body fluids).
- Rigid, leakproof, and puncture-proof sharps containers that are red or have a biohazardous waste label (for lancets, needles, and other sharp objects).

Every biohazardous waste container has a lid that you must replace immediately after use. In addition, you may not overfill the container, and you must replace it when it is two-thirds full. All biohazardous waste containers must have a fluorescent orange or orange-red label with the biohazard symbol and the word *BIOHAZARD* in a contrasting color (Figure 6-3). Red bags or red containers may be substituted for containers with biohazardous waste labels.

FIGURE 6-3 All biohazardous sharps containers must be rigid, leakproof, and labeled with the biohazard symbol.

© McGraw-Hill Education. David Moyer, photographer

You must follow these guidelines when handling biohazardous waste:

- Always wear gloves.
- Place biohazardous waste in the appropriate biohazardous waste container immediately or as soon as possible.
- Keep biohazardous waste containers close to the place where the waste material is generated.
- Keep the containers closed when not in use, close them before removing them from the area of use, and keep them upright to avoid any spills.
- If outside contamination of the primary container occurs, place that container in a secondary container to prevent leakage during handling, processing, storage, and transport.
- Drop—do not push—intact contaminated needles into the biohazardous waste container for sharps (Figure 6-4).
- To avoid accidental puncture wounds, never break off, recap, reuse, or handle needles after use.
- If there is a danger of biohazardous waste puncturing the primary container, place that container in a secondary container.
- Do not open, empty, or clean reusable sharps containers by hand.
- When they are two-thirds full, discard disposable sharps containers in large biohazardous waste containers.

FIGURE 6-4 A sharps disposal container is a receptacle for used needles, lancets, specimen slides, transfer pipettes, and other disposable pointed or edged instruments, supplies, and equipment.

© Leesa Whicker

Spills of hazardous chemicals or biohazardous materials can happen anywhere in the office. Immediately clean up spills or splashes of potentially contaminated material. Depending on the material, you may need to use special hazardous waste control products. Be sure to dry the area if appropriate, or clearly indicate that the area is still wet. When cleaning up spills, take the following measures:

- Place material in a biohazardous waste bag.
- Ensure that the bag is leakproof on the sides and bottom and can be closed tightly.
- Place the plastic bag in a cardboard box also marked with the biohazard symbol.

The outside waste management agency will pick up the box for incineration before disposing of it in a public landfill. Procedure 6-4 demonstrates the proper disposing of biohazardous waste.

Potentially infectious laundry waste also must be handled in a specific manner. OSHA has issued these regulations for handling this type of waste:

- Place contaminated laundry in a red laundry bag that is marked with the biohazard symbol, or recognizable to facility employees as contaminated material to be handled using standard precautions.
- Pack any laundry to be transported so that it does not leak in transit.
- Have the laundry washed in a designated area onsite or at a professional laundry facility.

Any laundry service the medical office uses should abide by all OSHA regulations. For example, anyone handling laundry must wear gloves and handle contaminated materials as little as possible.

Department of Health and Human Services' Centers for Disease Control and Prevention. These universal precautions prevent healthcare workers from exposing themselves and others to infections. Following universal precautions means assuming that all blood and body fluids are infected with bloodborne pathogens. universal precautions apply to the following:

- Blood and blood products
- Human tissue
- Semen and vaginal secretions
- Saliva from dental procedures
- Cerebrospinal, synovial, pleural, peritoneal, pericardial, and amniotic fluids, which bathe various internal structures in the body
- Other body fluids, if visibly contaminated with blood or of questionable origin in the body

Breast milk, although not on the list of fluids covered by universal precautions, is generally treated as such because it has been shown that mothers can pass along the human immunodeficiency virus (HIV) to their infants through breast milk.

Healthcare facilities now use **standard precautions**, which are a combination of universal precautions and rules to reduce the risk of disease transmission by means of moist body substances (known as Body Substance Isolation [BSI] guidelines). Standard precautions apply to the following:

- Blood
- All body fluids, secretions, and excretions except sweat
- Non-intact skin
- Mucous membranes

Standard precautions are used in healthcare facilities for the care of all patients. They are an important measure for preventing the transmission of disease in the healthcare setting.

As mentioned earlier, some types of pathogens can be transmitted when the host's infected blood comes in contact with another person's skin. Skin that has been broken from a

needle puncture or other wound and mucous membranes, such as those lining the nose and throat, are the areas that need the most protection. If a patient's (or coworker's) blood or body fluids come in contact with such areas, pathogens can be transferred from the patient's body to that of the medical worker.

OSHA outlines the routine safeguards to take when performing each medical procedure or task, depending on that task's level of risk. The degree of risk is determined by how much exposure to potentially infectious substances you are likely to encounter. When a procedure is explained, particular icons will be used to represent each of the OSHA guidelines. Figure 6-5 shows these icons.

OSHA divides tasks into the following three categories.

1. Category I tasks are those that expose a worker to blood, body fluids, or tissues or tasks that have a chance of spills or splashes. These tasks always require specific protective measures.
2. Category II tasks do not usually involve risk of exposure. Because they may involve exposure in certain situations, however, OSHA requires that precautions be taken.

FIGURE 6-5 These icons will appear at the beginning of each Procedure to let you know which OSHA guidelines you should follow. They represent (A) handwashing, (B) gloves, (C) mask and protective eyewear or face shield, (D) laboratory coat or gown, (E) reusable sharps container, (F) sharps disposal, (G) biohazardous waste container, and (H) disinfection.

3. Category III tasks do not require any special protection. These tasks, such as taking a patient's blood pressure, involve no exposure to blood, body fluids, or tissues. (Observe patients for open wounds before you touch them to perform such tasks.)

Category I Tasks A Category I task you might perform is assisting with a minor surgical procedure in the office, such as the removal of a cyst. This procedure requires that you wash your hands before and after the procedure and that you wear protective gloves, a mask and protective eyewear or a face shield, and protective clothing. After the procedure, you must follow the guidelines for dealing with disposable and nondisposable sharp equipment and decontaminating work surfaces.

Category II Tasks A Category II task you might perform is giving mouth-to-mouth resuscitation to a patient. Because blood is usually not visible in such situations, the task is not classified as Category I. Gloves are still recommended, however, although you may not have time to get them in an emergency. Because you will be exposed to saliva in such a procedure, OSHA recommends using disposable airway equipment and resuscitation bags (shown in Figure 6-6), which medical offices are required to supply.

OSHA recommends taking these precautions to decrease the risk of transmitting infectious diseases through mouth-to-mouth resuscitation. Of particular concern to healthcare workers are HIV, which causes AIDS, and the hepatitis B virus (HBV).

AIDS damages the body's ability to fight disease and is ultimately fatal in most instances. Hepatitis B is a highly contagious and potentially fatal disease that causes inflammation of the liver and sometimes liver failure. Healthcare workers become infected with these viruses at work every year. Hepatitis B infection occurs far more frequently on the job than does HIV infection.

Category III Tasks A Category III procedure you may perform is giving a patient medicated nose drops. This task involves tilting the patient's head and holding the dropper above the patient's nostril. Although you must perform aseptic handwashing before and after the procedure, there are no other protective requirements. Some Category III tasks require no

precautions. Examples of these tasks are instructing a patient in how to use a heating pad and how to take care of a cast for a broken leg.

Written Exposure Plan

In order to reduce the risk of bloodborne pathogen exposure, OSHA requires that every medical facility have a written exposure control plan (ECP). Employees who are at risk of bloodborne exposure must have access to the ECP. This plan must be reviewed with new employees at the onset of employment and with all employees on an annual basis. A written copy of the plan must be made available if an employee requests it. The ECP must include the following:

- Determination of employee exposure
- Implementation of exposure control methods, including universal precautions, engineering and work practice controls, personal protective equipment, and housekeeping
- Hepatitis B vaccination
- Postexposure evaluation and follow-up
- Communication of hazards to employees and hazard training
- Recordkeeping
- Procedures for evaluating circumstances surrounding exposure incidents

Exposure Incidents

The OSHA Bloodborne Pathogens Standard also specifies what to do in case of an exposure incident. An exposure incident is one in which a worker, despite all precautions, has reason to believe that he has come in contact with a substance that may transmit infection. Contact may occur when a medical worker accidentally sticks himself with a used needle. A puncture exposure incident is the most common kind of exposure.

The basic rules covering exposure incidents apply to all serious infections, such as HBV and HIV. The rules covering HBV also include vaccination.

When an exposure incident occurs, the physician or employer must be notified immediately. This prompt action is extremely important because quick and proper treatment can help prevent the development of many diseases, such as hepatitis B. Timely action also can prevent the worker from exposing other people to a potentially acquired infection. Reporting the incident helps to prevent the same type of accident from happening again.

After such an exposure, the employer must offer the exposed employee a free medical evaluation. The employer must refer the employee to a licensed healthcare provider who can counsel the employee about what happened as well as about how to prevent the spread of any potential infection. The healthcare provider also takes a blood sample and prescribes appropriate treatment. If the employee does not want to participate in the medical evaluation and treatment, he has the right to refuse it. If this occurs, the employee's refusal should be documented.

FIGURE 6-6 Resuscitation bags are used when a person requires mouth-to-mouth resuscitation. You must use one of these bags or another barrier device when performing mouth-to-mouth resuscitation.

© Stockbyte/Getty Images RF

If an employee who has not received the HBV vaccination and is not known to be immune is exposed to any infected person, especially someone who is HBV-positive or at high risk, it is recommended that the employee be tested for HBV and receive the vaccination if necessary. This vaccination may prevent infection. When the source person's HBV status is unknown and the person does not wish to be tested, the employee should be tested. If the source person agrees to be tested, the law requires that the employee be informed of the test results. The employee may agree to give blood but not to be tested. In such a case, the blood sample must be kept for 90 days in case the employee later develops symptoms of HBV or HIV infection and decides to be tested then.

The healthcare provider who performs the postexposure evaluation must give the employer a written report stating whether HBV vaccination was recommended and received and that the employee was informed of the results of any blood tests. Any additional information must be kept confidential.

Other OSHA Requirements

OSHA also requires that all healthcare workers who have occupational exposure to blood or other potentially infectious materials have the opportunity to receive the HBV vaccine, free of charge, as needed throughout employment. Within 10 days of a medical worker's starting a job, the doctor or employer is required to offer the worker the opportunity to receive this vaccination. The vaccine is recommended for all healthcare workers *unless*

- They have received it in the past;
- A blood test shows them to be immune to the virus; and/or
- There are medical reasons for which the vaccine is contraindicated.

In most cases, the employee is permitted to decline the vaccination if she signs a form accepting all the conditions. (A few employers require HBV vaccination as a condition for employment.) Even if the healthcare worker declines the vaccination when beginning employment, she still has the opportunity to receive the free vaccine and any necessary booster shots throughout her employment.

Needlestick Safety and Prevention Act In response to the Needlestick Safety and Prevention Act, which was signed into law in November 2000, OSHA revised the Bloodborne Pathogens Standard. The additional provisions to the standard are

- Healthcare employers must evaluate new safety-engineered control devices on an annual basis and implement the use of devices that reasonably reduce the risk of needlestick injuries.
- Healthcare facilities must maintain a detailed log of sharps injuries incurred from contaminated sharps.
- Healthcare employers must solicit input from employees involved in direct patient care to identify, evaluate, and implement engineering and **work practice controls** (controlling injuries by altering the way a task is performed).

In an effort to reduce needlestick injuries, the National Institute for Occupational Safety and Health (NIOSH) has specific recommendations for employers and employees regarding **engineered safety devices**, devices specifically designed to isolate or remove the hazard, and work practice controls. NIOSH recommendations for employers include the following:

Engineering Controls

- Eliminate the use of needles where safe and effective alternatives are available.
- Implement the use of engineered safety devices and evaluate their use on a regular basis.

Needlestick Prevention Programs

- Analyze sharps injuries to identify hazard trends in the workplace.
- Ensure employees are properly trained in the proper use and disposal of sharps.
- Adapt work practices that involve sharps to make them safer.
- Make safety awareness in the workplace a priority.
- Have established procedures for reporting all needlestick injuries.
- Evaluate prevention procedures and provide feedback to employees.

NIOSH recommendations for employees include the following:

- Avoid using needles if a safe alternative exists.
- Participate in choosing engineered safety devices.
- Use the engineered safety devices provided by your employer.
- Do not recap needles if possible.
- Before beginning a procedure, make sure you have a means of safe sharps disposal close by and ready for use.
- Dispose of used needles promptly and appropriately.
- Promptly report all sharps-related injuries.
- Advise your employer if you see sharps hazards in the workplace.
- Participate in bloodborne pathogen training.

▶ Transmission-Based Precautions **LO 6.4**

In addition to strict adherence to standard precautions, there may be situations that require an additional level of precaution you must take in order to protect yourself, the facility staff, and other patients from exposure to infectious disease. For this reason, the CDC has developed guidelines known as **transmission-based precautions**. These guidelines are meant as a supplement to standard precautions when caring for patients with suspected or confirmed infection.

Transmission-based precautions include three categories:

- Contact precautions
- Droplet precautions
- Airborne precautions

Contact Precautions

Contact transmission is transmission by touching and is the most common means of spreading infectious diseases. The two subgroups of contact transmission are direct and indirect. As you learned earlier in the chapter, direct contact involves the spread of microorganisms from person to person by touching without an intermediate object. Microorganisms are spread indirectly by touching contaminated surfaces and objects.

Applying Contact Precautions You must use contact precautions with patients who have any of the following conditions or diseases:

- Stool incontinence/severe, uncontrolled diarrhea
- Draining wounds
- Uncontrolled secretions
- Decubitus ulcers (pressure sores)
- Ostomy tubes
- Generalized rash

Contact precautions include

- Washing your hands before and after touching the patient.
- Wearing gloves.
- Wearing a gown if considerable contact is expected.
- Washing hands after removing gloves.
- Disinfecting the exam room with EPA-registered disinfectant.

Droplet Precautions

Transmission of microorganisms by contact with secretions from the nose, throat, airways, lungs, and digestive tract is known as droplet contact. Droplets from coughs and sneezes can carry up to 3 feet from the source (Figure 6-7). Follow droplet precautions when assisting with patients suspected of having influenza, pertussis (whooping cough), mumps, respiratory syncytial virus, norovirus, and *Neisseria meningitidis* (a bacterium that causes meningitis).

Applying Droplet Precautions Patients suspected of being infected with a pathogen transmitted by droplets should

FIGURE 6-7 Uncovered coughs and sneezes can spread droplets for several feet.

James Gathany/CDC

be placed in an exam room as quickly as possible. If you do not have an open exam room, ask the patient to put on a face-mask and place the patient as far away from other patients as possible. When caring for a patient with influenza or other droplet-transmitted infection, put on a mask before entering the room. If the patient is coughing or sneezing uncontrollably and substantial spraying of respiratory droplets is expected, you should also wear gloves, a gown, and goggles or a face shield. Wash your hands before and after touching the patient or contacting respiratory secretions. Ask the patient to wear a mask when leaving the exam room and instruct her in respiratory hygiene and cough etiquette. Always clean and disinfect the exam room before allowing the next patient to enter.

Airborne Precautions

Some microorganisms are able to float in the air for substantial distances. For this reason, special airborne precautions must be taken if a patient is suspected of being infected with any known pathogen capable of being transmitted through the airborne route. The most common pathogens transmitted by the airborne route include tuberculosis, measles, chickenpox, and in some cases herpes zoster (shingles).

Applying Airborne Precautions Because airborne pathogens float in the air, anyone in the vicinity of an infected patient can easily be exposed. For this reason, it is important to isolate the patient as soon as possible. Have the patient enter through a different entrance than other patients, avoiding the reception area. Place the patient in a special airborne infection isolation room (AIIR), if one is available. If this type of room is not available, you should give the patient a face-mask, close the door to the exam room, instruct the patient to keep the mask on, and change it if it becomes wet. The health-care practitioner treating the patient will most likely transfer the patient to a facility equipped with special isolation rooms and fit-tested respirators. While caring for a patient with a suspected airborne pathogen, be sure to perform hand hygiene before and after patient contact and wear a mask, gloves, and a gown. Have the patient wear a mask at all times. After the patient leaves the room, keep the room empty for at least an hour, depending on the ventilation rate of the room. If you must enter the room before the prescribed time, you must use respiratory protection.

► OSHA-Required Education and Training

LO 6.5

In order for healthcare personnel to adhere to infection control policies and procedures, they must be properly trained. This training must be comprehensive and ongoing, and the trainers must have documented and demonstrated competency related to the task. Employers are required to provide infection control training at the onset of employment and then on a regular basis (usually yearly) or when a policy or procedure changes or there is a change in circumstances, such as an outbreak of influenza. Training should include the scientific rationale for infection control procedures. Understanding the rationale

helps healthcare workers perform the procedures correctly and alter them safely to specific situations when necessary. Anyone working in a healthcare facility who could be reasonably expected to come in contact with an infectious agent must be trained. This includes any contract worker from an outside agency, such as students participating in on-site training, housekeeping personnel, and equipment maintenance personnel who repair and maintain clinical equipment. This training must include

- Proper PPE selection and use.
- Job-specific infection prevention.

Improvement in adherence to infection control procedures and subsequent reduction in **healthcare-associated infections (HAI)** has been documented. Research shows that periodic assessment and feedback regarding healthcare workers' adherence to infection control practices in addition to education results in better adherence to those practices. Reduction in the transmission of infectious disease requires that not only healthcare workers understand how to break the chain of infection but also patients and their families. Patients and family members should be given information on standard precautions, respiratory hygiene, cough etiquette, and the importance of vaccination.

PROCEDURE 6-1 Aseptic Handwashing

Procedure Goal: To remove dirt and microorganisms from under the fingernails and from the surface of the skin, hair follicles, and oil glands of the hands

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissues.

Materials: Liquid soap, disposable brush or nail cleaner, and paper towels

Method:

1. Remove all jewelry (plain wedding bands may be left on and scrubbed).
2. Turn on the faucets using a paper towel and adjust the water temperature to moderately warm. (Sinks with knee-operated faucet controls prevent contact of the surface with the hands.)

FIGURE Procedure 6-1 Step 2 Using a paper towel to turn on the faucet reduces the possibility of cross contamination.

© McGraw-Hill Education

3. Wet your hands and apply the recommended amount of liquid soap. Use a clean, dry paper towel to activate soap pump. Liquid soap, especially when dispensed with a foot pump, is preferable to bar soap.

RATIONALE: *There is less available area for dirt to accumulate on a liquid soap dispenser than on bar soap, and there is a smaller chance of dropping the soap dispenser into the sink or onto the floor.*

4. Work the soap into a lather, making sure that all surface areas of both hands are lathered. Rub vigorously in a circular motion for 2 minutes. Keep your hands lower than your forearms so that dirty water flows into the sink instead of back onto your arms. Your fingertips should be pointing down. Interlace your fingers to clean between them, and use the palm of one hand to clean the back of the other. It is important that you wash every surface of your hands.

RATIONALE: *Microorganisms are found on every surface of the hand and, if not washed away, can be transferred to the patient.*

5. Use a single-use disposable nailbrush or plastic, single-use nail cleaner under running water to dislodge dirt around your nails and cuticles.

RATIONALE: *Microorganisms under the nails are not directly subjected to the running water and must be dislodged so that they can be washed away.*

6. Rinse your hands well, keeping your hands lower than your forearms and not touching the sink or faucets.

FIGURE Procedure 6-1 Step 6 Keep your hands lower than your forearms and avoid touching the sink when rinsing after an aseptic handwash.

© McGraw-Hill Education

7. With the water still running, dry your hands thoroughly with clean, dry paper towels.
8. Turn off the faucets using a clean, dry paper towel. Discard the towels.

PROCEDURE 6-2 Using an Alcohol-Based Hand Disinfectant

Procedure Goal: To use an alcohol-based hand-cleansing substance to reduce pathogens on the hand surfaces and prevent recontamination

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: 60% to 95% alcohol-based foam, gel, or liquid rub

Method:

1. Remove all jewelry (plain wedding bands may be left on).
2. Pump the recommended amount of AHD onto the palm of the hand.

RATIONALE: *You must use enough AHD to cover all surfaces of the hands and there must be enough so that it does not dry too quickly.*

3. Rub the hands together vigorously, ensuring the alcohol comes in contact with all surfaces, including backs of hands, between fingers, and fingernails.

RATIONALE: *Microorganisms are found on every surface of the hand and, if not washed away, can be transferred to the patient.*

4. Continue to rub the solution in a rotary fashion until it is evaporated and the hands are dry (10–15 seconds). Do not wave hands to hasten drying.

RATIONALE: *Once they evaporate, AHD have no effect on pathogens.*

PROCEDURE 6-3 Using a Biohazardous Sharps Container

Procedure Goal: To ensure safe use of a sharps disposal unit

OSHA Guidelines:

Materials: Approved sharps container and gloves

Method:

1. Wash your hands and put on gloves.
2. Ensure that biohazardous waste containers are close to the place where the waste material is generated.

RATIONALE: *To avoid accidental puncture wounds or exposure to biohazardous waste*

3. Hold the article by the unpointed, or blunt, end.
4. Drop the object directly into an approved container. (If you are using an evacuation system, do not unscrew the needle. Drop the entire system with the needle attached and the safety device engaged into the receptacle.) The container should be puncture-proof, with rigid sides and a tight-fitting lid.

RATIONALE: *To avoid needlestick injuries*

5. Place sharps in an appropriate biohazardous waste container immediately or as soon as possible.
6. Keep containers closed when not in use. Close them before removing them from the area or use and keep them upright to avoid spills.
7. Place the container in a secondary container if the outside of the primary container becomes contaminated.
8. Drop—do not push—intact contaminated needles into the biohazardous waste container for sharps.

RATIONALE: *To avoid accidental puncture wounds*

9. Never break off, recap, reuse, or handle needles after use.

RATIONALE: *To avoid accidental puncture wounds*

10. Do not open, empty, or clean sharps containers.
11. Discard sharps containers that are two-thirds full in large biohazardous waste containers. Depending on your office's procedures, the container and its contents may be sterilized before further disposal, or they may be collected by an authorized waste management agency.
12. Remove the gloves and wash your hands.

PROCEDURE 6-4 Disposing of Biohazardous Waste

Procedure Goal: To correctly dispose of contaminated waste products, including sharps and contaminated cleaning and paper products

OSHA Guidelines:

Materials: Biohazardous waste containers, gloves, and waste materials

Method:

1. Wash your hands and put on gloves.
2. Carefully deposit the biohazardous materials in a properly marked biohazardous waste container. A standard biohazardous waste container has an inner plastic liner (either red or orange and marked with the biohazard symbol) and a puncture-proof outer shell (also marked with the biohazard symbol).

3. Never “dump” the contents of one biohazardous waste container into another.

RATIONALE: *Doing so puts you at risk of exposure to biohazardous materials.*

4. If the container is full, secure the inner liner and place it in the appropriate area for biohazardous waste.

RATIONALE: *Biohazardous waste must be held in an area separate from regular waste and trash.*

5. Remove the gloves and wash your hands.

S U M M A R Y O F L E A R N I N G O U T C O M E S	
LEARNING OUTCOMES	KEY POINTS
6.1 Identify OSHA’s role in protecting healthcare workers.	The US Department of Labor created OSHA to protect the employees’ safety in the workplace. Through the creation and enforcement of standards such as the Bloodborne Pathogens Standard, Hazard Communication, and the Needlestick Safety and Prevention Act, OSHA serves to protect healthcare workers from hazards.
6.2 Illustrate the cycle of infection and how to break it.	In order for an infection to occur, these five elements must be in place: a reservoir host, a means of exit, a means of transmission, a means of entrance, and a susceptible host. The most effective means of breaking the cycle of infection is by using aseptic techniques. These include maintaining strict housekeeping standards, adhering to government health guidelines, and educating patients in hygiene, health promotion, and disease prevention.
6.3 Summarize the Bloodborne Pathogens Standard and universal precautions as described in the rules and regulations of the Occupational Safety and Health Administration (OSHA).	Laws set forth in the OSHA Bloodborne Pathogens Standard of 1991 dictate how you must handle infectious or potentially infectious waste generated during medical or surgical procedures. According to these rules, any potentially infectious waste materials must be discarded or held for processing in biohazardous waste containers.
6.4 Describe how transmission-based precautions supplement standard precautions.	Transmission-based precautions are meant to supplement standard precautions by adding an additional level of precautions. These include contact precautions, droplet precautions, and airborne precautions.
6.5 Summarize OSHA’s education and training requirements for ambulatory care settings.	All ambulatory care settings must train employees and contract workers in the proper selection and use of PPE and job-specific infection prevention. This training must be done when the worker is hired and on a regular basis after that. In addition, patients and their families should be given information about preventing the spread of infection.

Recall Shenya Jones from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding her case.

1. What aseptic technique practices would be most important with this patient?
2. Whom do these aseptic technique practices protect?
3. Why is it important that Dr. Williams do a wound culture?

EXAM PREPARATION QUESTIONS

1. (LO 6.1) The general duty clause requires
 - a. That every employee perform every duty in the office
 - b. An employer to maintain a safe workplace
 - c. That each employee follow OSHA regulations
 - d. That safety plan duties be well defined
 - e. That healthcare workers not wear artificial nails when working with any patients
2. (LO 6.2) A bladder infection caused by *Escherichia coli* would be considered what type of infection?
 - a. Vector-borne
 - b. Exogenous
 - c. Opportunistic
 - d. Endogenous
 - e. Foodborne
3. (LO 6.4) A set of guidelines set forth by the CDC that are meant to supplement standard precautions are known as
 - a. Transmission-based precautions
 - b. Training guidelines
 - c. Respiratory hygiene
 - d. OSHA supplemental procedures
 - e. NIOSH recommendations
4. (LO 6.4) Droplet precautions pertain to someone who has which of the following?
 - a. Ostomy tube
 - b. Stool incontinence
 - c. Draining wound
 - d. Generalized rash
 - e. Influenza infection
5. (LO 6.2) Which of the following is the *most* common means of transmitting pathogens?
 - a. Ingesting food
 - b. Sneezing
 - c. Coughing
 - d. Sexual contact
 - e. Touching
6. (LO 6.2) Which of the following would be considered a fomite?
 - a. Mosquito
 - b. Pencil
 - c. Sneeze
 - d. *E. coli*
 - e. Mucus
7. (LO 6.5) OSHA requires that all workers have initial training in PPE selection and
 - a. Respirator use
 - b. Job-specific infection prevention
 - c. Sharps control
 - d. Microbiology
 - e. Equipment handling
8. (LO 6.3) Exposure to which of the following would be considered an exposure incident?
 - a. Influenza
 - b. Mumps
 - c. HPV
 - d. HIV
 - e. Scabies
9. (LO 6.3) Which of the following would be considered a Category II task?
 - a. Performing oral surgery
 - b. Performing CPR
 - c. Taking vital signs
 - d. Measuring height
 - e. Controlling bleeding
10. (LO 6.3) Means of controlling injuries by altering the way a task is performed is known as
 - a. Universal precautions
 - b. Engineering controls
 - c. Personal protection
 - d. Work practice controls
 - e. Safety plan controls

SOFT SKILLS SUCCESS

You are a new graduate of a medical assisting program and have just been hired by an internal medicine practice with seven practitioners. This is a very busy office and you are excited to be working in the clinical area. Since you are new to the practice, you will shadow with Mary Benton, RMA. This morning is particularly busy and you have seen several patients with suspected influenza. After the morning patient session, Mary approaches you and says that you could save time by not washing your hands so much. She tells you that,

if you are wearing gloves, you don't have to wash your hands after you take them off. How do you respond to Mary, and what action should you take?

Safety and Patient Reception

7

CASE STUDY

PATIENT INFORMATION	Patient Name	DOB	Allergies
	Peter Smith	3/28/19XX	NKA
	Attending	MRN	Other Information
	Paul F. Buckwalter, MD	428-69-544	Mrs. Smith requests to speak privately with MD.

Peter Smith is a 73-year-old male with mild Type 2 diabetes. When he called to schedule today's appointment, he stated that he was feeling very anxious and fatigued and that he was having difficulty eating and sleeping. He arrives at the reception desk today, appearing "flat" in affect. After

© Image Source/Getty Images RF

he signs in, his wife whispers to you, "I want to talk with the doctor about him, before he sees the doctor." Once Mr. Smith sits down, you notice him lean over and try to pick up a magazine from a table. His chair tips onto two legs while he continues to try to reach the magazine.

Keep Mr. Smith in mind as you study the chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

 **ACTIVSim**

LEARNING OUTCOMES

After completing Chapter 7, you will be able to:

- 7.1** Describe the components of a medical office safety plan.
- 7.2** Summarize OSHA's Hazard Communication Standard.
- 7.3** Describe basic safety precautions you should take to reduce electrical hazards.
- 7.4** Illustrate the necessary steps in a comprehensive fire safety plan.
- 7.5** Summarize proper methods for handling and storing chemicals used in a medical office.
- 7.6** Explain the principles of good ergonomic practice and physical safety in the medical office.
- 7.7** Articulate the cause of most injuries to medical office workers and the four body areas where they occur.
- 7.8** List the design items to be considered when setting up an office reception area.
- 7.9** Summarize the housekeeping tasks required to keep the reception area neat and clean.
- 7.10** Relate how the Americans with Disabilities and Older American Acts have helped to make physical access to the medical office easier for all patients.
- 7.11** Describe the functions of the front office staff, including patient registration and accepting payments from patients.
- 7.12** Implement policies and procedures for opening and closing the office.

KEY TERMS

Americans with Disabilities Act (ADA)
color family
contagious
ergonomics

Globally Harmonized System of Classification and Labeling of Chemicals (GHS)

Hazard Communication Standard (HCS)
hazard label
infectious waste

Older Americans Act of 1965
Safety Data Sheets (SDS)

MEDICAL ASSISTING COMPETENCIES

CAAHEP

- X.C.4** Summarize the Patient Bill of Rights
- XII.C.1** Identify:
 - (a) safety signs
 - (b) symbols
 - (c) labels
- XII.C.2** Identify safety techniques that can be used in responding to accidental exposure to:
 - (a) blood
 - (b) other body fluids
 - (c) needle sticks
 - (d) chemicals
- XII.C.3** Discuss fire safety issues in an ambulatory healthcare environment
- XII.C.4** Describe fundamental principles for evacuation of a healthcare setting
- XII.C.5** Describe the purpose of Safety Data Sheets (SDS) in a healthcare setting
- XII.C.6** Discuss protocols for disposal of biological chemical materials
- XII.C.7** Identify principles of:
 - (a) body mechanics
 - (b) ergonomics
- XII.P.1** Comply with:
 - (a) safety signs
 - (b) symbols
 - (c) labels
- XII.P.2** Demonstrate proper use of:
 - (a) eyewash equipment
 - (b) fire extinguishers
 - (c) sharps disposal containers
- XII.P.3** Use proper body mechanics
- XII.P.5** Evaluate the work environment to identify unsafe working conditions

ABHES

4. MEDICAL LAW AND ETHICS

- b. Institute federal and state guidelines when releasing medical records or information
- f. Comply with federal, state, and local health laws and regulations as they relate to healthcare settings

5. PSYCHOLOGY OF HUMAN RELATIONS

- c. Intervene on behalf of the patient regarding issues/concerns that may arise, i.e. insurance policy information, medical bills, physician/provider orders, etc.

9. CLINICAL PROCEDURES

- a. Practice standard precautions and perform disinfection/sterilization techniques
- g. Recognize and respond to medical office emergencies
- j. Make adaptations with patients with special needs

10. MEDICAL LABORATORY PROCEDURES

- c. Dispose of biohazardous materials

► Introduction

In general, the medical office is divided into two broad, functional categories: The “back office” is the clinical area where patient care takes place and the “front office,” including the reception area, is where business and nonclinical tasks take

place. Whether you are working in the clinical area or the administrative area, safety should be foremost in your mind. Patients and staff members can fall or cut themselves and be exposed to numerous safety hazards. As a medical assistant, you have an important responsibility to remove or correct the hazards—physical, chemical, and biohazardous—that

might cause injury to patients, healthcare practitioners, or staff members. In addition to safety, it is important to create an atmosphere that reflects on the quality of care patients can expect to receive. A carefully designed, well-maintained, and safe patient reception area ensures a pleasant and comfortable experience for patients while they wait to receive medical care and sets the stage for a successful interaction between the patient and the entire medical staff.

In this chapter, you will learn basic safety, including the components of a safety plan, OSHA Hazard Communication, and electrical, fire, and chemical safety. You will also be introduced to the many considerations related to the design and furnishings for the reception area of the medical office. The type of practice and the patient population's special needs are major influences, so you will explore the Americans with Disabilities and the Older Americans Acts. The roles of reception staff and what they need to accomplish in these roles will also be covered.

► The Medical Office Safety Plan LO 7.1

Minimizing risk to patients, physicians, and staff by creating a safe environment in the medical office is essential. Both the administrative and clinical areas in an office environment contain many potential hazards. Having an established, routinely updated safety plan is a good first step in hazard awareness. Awareness and understanding of potential dangers facilitate the removal or correction of these hazards.

Every medical office must have a comprehensive written safety plan that is easily accessible to all employees and updated annually. Every employee is responsible for becoming familiar with and following the safety plan's policies and procedures. This plan must contain but is not limited to the following:

- OSHA Hazard Communication
- Electrical safety
- Fire safety
- Emergency action plan
- Chemical safety
- Bloodborne pathogen exposure
- Personal protective equipment
- Needlestick prevention

► OSHA Hazard Communication Standard LO 7.2

OSHA's **Hazard Communication Standard (HCS)** was originally designed to keep workers safe by requiring that all workers have the right to know what chemicals they were exposed to during the course of their job. In 2012, the standard was updated with the intention that workers have a right not only to know but also to understand the dangers of any chemicals to which they may be exposed. To this end, the HCS has been aligned with the United Nations **Globally Harmonized System of Classification and Labeling of Chemicals (GHS)**. The update includes changes to the information sheets that accompany each chemical, the **Safety Data Sheets** (formerly called Material Safety Data Sheets), and to the **hazard labels** required for each chemical container. Chemical

manufacturers and importers are now required to determine the hazards of the chemicals they produce. This includes the health and physical hazards and classification of chemical mixtures. This update will improve the consistency of chemical hazard information by standardizing the way it is communicated, thus improving chemical safety in the workplace.

The new standard requires each employer to:

- Train all employees on the revised standard.
- Have a written communication program.
- Provide employees with easy access to Safety Data Sheets for any chemical used in the facility.
- Keep a master list of hazardous chemicals in the facility.
- Ensure that any chemical kept in a secondary container be properly labeled.

Safety Data Sheets

Safety Data Sheets (SDS) are information sheets for every hazardous chemical. The format of these sheets has been standardized so that workers can quickly find information about hazardous chemicals in case of an accident or emergency. All Safety Data Sheets contain 16 sections. General information about the chemical is contained in sections 1–8, and additional, more technical information is found in sections 9–16.

The mandatory contents of each SDS include the following sections:

1. Identification—including the chemical, its intended uses, and contact information of the supplier
2. Hazard(s) Identification—the chemical's hazard, including the hazard classification (for example, "flammable"); a signal word, hazard statement, pictogram, and precautionary statement
3. Composition/Information on Ingredients—all ingredients contained in the product
4. First-Aid Measures—the initial care that should be rendered after exposure, including routes of exposure, symptoms, and special treatments if needed
5. Fire-Fighting Measures—proper extinguishing equipment, specific hazards resulting from the chemical during a fire, and necessary special protective equipment
6. Accidental Release Measures—action that should be taken in case of spills, leaks, or releases, including containment and cleanup
7. Handling and Storage—handling and hygiene practices and storage requirements, including incompatible chemicals and ventilation requirements
8. Exposure Controls/Personal Protections—exposure limits, required engineering controls, and PPE necessary to reduce exposure
9. Physical and Chemical Properties—appearance, odor, pH, melting and boiling points, flash point, and solubility
10. Stability and Reactivity—reactivity data, stability under normal conditions, and other information regarding hazardous reactions
11. Toxicological Information—likely routes, effects from exposure, and symptoms

The nonmandatory contents of each SDS include the following sections:

12. Ecological Information—environmental impact if the chemical is released
13. Disposal Considerations—may include appropriate disposal, recycling, or reclamation of the chemical or its package
14. Transport Information—may include guidance for shipping by air, land, or sea
15. Regulatory Information—any regulations not found elsewhere on the SDS
16. Other Information—may include when the SDS was prepared or revised and changes made in the revision

Labels

As part of the alignment with the GHS, all labels on hazardous chemicals must provide quick and simple graphic information about the chemical. Figure 7-1 is a sample of the revised hazardous chemical label. All hazardous chemical labels must include the following:

- Manufacturer's name and address
- Product identifier (name, batch number, and so on)
- Signal words (Danger, Warning, and so on)
- Hazard Statement
- Precautionary Statement (prevention, response, storage, and disposal)
- Pictograms (must be banded in red) (Figure 7-2 illustrates the OSHA-approved pictograms required on hazard labels)

Biohazard Labels In addition to containers with hazardous chemicals, all containers used to store waste products,

blood, blood products, or other specimens that may be contaminated with bloodborne pathogens are considered biohazardous. They must be clearly marked with the biohazard symbol, as shown in Figure 7-3. The biohazard symbol label must be bright orange-red and clearly lettered so that no one can mistake the meaning of the warning. Labels should be securely attached to containers.

In addition to individual biohazard labels that identify particular containers, warning signs must be posted in the laboratory itself. These signs, such as the one shown in Figure 7-4, identify the presence of biohazardous material and list important safeguards to follow.

Electrical Safety

LO 7.3

Because the equipment used in the medical office can make the office especially vulnerable to electrical hazards, it is critical that you know how to respond to an electrical accident. In addition to familiarizing yourself with the location of circuit breakers and emergency power shutoffs, practice these safeguards, which reduce electrical hazards:

- Avoid using extension cords. If they must be used, be sure the circuit is not overloaded. Tape extension cords to the floor to avoid tripping.
- Frayed electrical wires, overloaded outlets, and improperly grounded plugs present a danger of electric shock and fire. Contact a licensed electrician to remedy these problems. Repair or replace equipment that has a broken or frayed cord.
- Dry your hands before working with electrical devices.
- Do not position electrical devices near sinks, faucets, or other sources of water. Be sure electrical cords do not run through water.

FIGURE 7-1 The revised hazardous chemical label gives quick, simple, and graphic information about the chemical.

GHS Pictograms and Hazard Classes		
		
▪ Oxidizers	▪ Flammables ▪ Self Reactives ▪ Pyrophorics ▪ Self-Heating ▪ Emits Flammable Gas ▪ Organic Peroxides	▪ Explosives ▪ Self Reactives ▪ Organic Peroxides
		
▪ Acute Toxicity (severe)	▪ Corrosives	▪ Gases Under Pressure
		
▪ Carcinogen ▪ Respiratory Sensitizer ▪ Reproductive Toxicity ▪ Target Organ Toxicity ▪ Mutagenicity ▪ Aspiration Toxicity	▪ Environmental Toxicity	▪ Irritant ▪ Dermal Sensitizer ▪ Acute Toxicity (harmful) ▪ Narcotic Effects ▪ Respiratory Tract ▪ Irritation

FIGURE 7-2 Pictograms are required on every hazardous chemical label and give graphic information about the chemical or chemicals inside the container.

► Fire Safety

LO 7.4

Fire is a safety hazard anywhere, but it is especially likely where there is sophisticated, high-voltage medical equipment such as an X-ray machine. Any electrical instrument in the exam room, however, is a potential fire hazard. Other potentially hazardous items are gas tanks and flammable chemicals. As discussed in this section, you should practice fire safety by

taking action to prevent it and knowing what action to take in the event of a fire.

Fire Prevention

Be aware of anything that might cause a fire in the exam room, examples of which are outlined in the following bullets. If you cannot correct the situation yourself, report the hazard to your supervisor.

FIGURE 7-3 The biohazard symbol identifies material that has been exposed to potentially contaminated substances such as blood, blood products, or other body fluids. This symbol is used wherever there is a possibility of exposure to biohazardous substances.

FIGURE 7-4 The biohazard warning sign alerts personnel to the presence of potentially contaminated substances and advises them about safety guidelines.

- *Extremely flammable materials, including alcohol and some disinfectants.* Supplies such as paper table coverings also can ignite and spread flames quickly in the event of a fire. Check to make sure that all flammable items are stored and disposed of properly to minimize fire danger. Also, keep flammable liquids away from any heat source. If you are not sure whether a chemical is flammable, read the manufacturer's label or Safety Data Sheet.
- *Smoking.* Smoking should not be permitted anywhere in a medical facility. In addition to causing health problems, smoking is a fire hazard. "No Smoking" signs should be posted prominently throughout the office.
- *Inoperative smoke detectors.* Make sure that smoke detectors throughout the office are working properly. Replace batteries promptly. If smoke detectors are wired into the building's electrical system, report any malfunction to the building manager. If possible, alarms should have sound and visual modes.

Working in the physician's office laboratory may sometimes require that you use a flame. These special precautions are essential in such circumstances:

- If you must use an open flame, extinguish it immediately after use.
- When using an open flame, keep your hair, clothing, and jewelry away from the flame source.
- If you must use a chemical in a procedure that requires an open flame, double-check the SDS to identify the fire risk level for that chemical. If necessary, take a fire extinguisher to the area in which you will be working.
- Never lean over an open flame.
- Never leave an open flame unattended.
- Turn off gas valves immediately after use. If you must use an open flame in the vicinity of a gas valve, always double-check to be sure the gas is off. Make sure there is adequate ventilation.

In Case of Fire

Despite the precautions that you and your coworkers take, a fire may break out. Be prepared to use fire safety equipment and to evacuate the building safely. The paragraphs that follow provide specific information on using fire safety equipment and carrying out emergency action plans and drills.

Using Safety Equipment The number of fire extinguishers in the office depends on the office's size and its number of rooms. Regardless of the total number of extinguishers, you should locate an all-purpose fire extinguisher in or close to each exam room. The office manager or safety officer should have the fire extinguisher professionally serviced once a year to ensure its effectiveness. It is important that each employee learns how to use a fire extinguisher. Procedure 7-1 describes the proper method for handling a fire emergency. OSHA recommends that employees know the "PASS" system:

- Pull the pin.
- Aim at the base of the fire.
- Squeeze the trigger.
- Sweep side to side.

Posters with the "PASS" acronym are available from OSHA.

If there is a fire blanket in the exam room, be sure that you know how to use it and that it is stored for easy access in an emergency. To use a fire blanket to smother burning clothing, wrap the victim in the blanket and roll him on the floor. You also can contact your local fire department for more information about fire safety training.

Emergency Action Plans and Drills

Every employee must be prepared to take appropriate action during a fire emergency. An emergency action plan that outlines the employees' responsibilities is needed in order to reduce panic in an emergency and to reduce the likelihood of

FIGURE 7-5 An evacuation route is clearly outlined on a map and posted throughout the office.

severe bodily injury. Participation in periodic fire drills is an essential part of this plan. The other important components of an effective emergency action plan are outlined in the paragraphs that follow.

Name of the person or persons responsible for reporting the fire and overseeing the entire operation. Ideally, two people are responsible for this task—a primary and a secondary. In the event the person with primary responsibility is out of the office, the person who is second on the list takes primary responsibility for reporting and overseeing.

Building evacuation routes. Maps of the office floor plan should be located throughout the office and marked with the current location and nearest exit. The route between the current location and the nearest exit should be highlighted or outlined on the map. See Figure 7-5. All exits should have a well-lit and easy-to-see exit sign. Halls leading to the exit should have emergency lighting so they remain lit in the event of a power failure. Halls also should be clutter free at all times. Exit routes should be large enough to accommodate all evacuees, including those with disabilities.

Evacuation procedure. Several employees should be responsible for ensuring that patients and staff are appropriately evacuated from the building. Patients in exam and procedure rooms may have special needs. Large medical practices may need to create different zones within the office. Each zone should have two individuals in charge of that specific area. Zones in the patient reception areas might be handled differently than zones in the clinical areas. Those responsible for evacuation should be the last to leave and should perform a quick search of bathrooms, break rooms, and other areas to ensure everyone has left the building. Two employees should be responsible for removing the book containing the SDS and handing it over to the first responders at the scene. Having designated areas outside the building to assemble the evacuees makes accounting for employees and patients easier.

A plan for accounting for all employees and patients after the evacuation is completed. Conduct a head count or roll call of all employees. To account for patients in the office, use the check-in roster. Give the name of any missing employee or patient to the person in charge. Quick action is a matter of life or death if someone is trapped in the building during a fire emergency.

Emergency action plan drills. Practice the emergency action plan on a regular basis and conduct unannounced drills so that each individual better understands her role. Having an emergency action plan drill allows for evaluation and refinement of the plan. You don't want to find out your plan doesn't work in the middle of a true emergency.

Local emergency contacts. Dialing 911 is the most common way to report an emergency; there may be other internal numbers if your facility is large. A list of fire and EMS numbers should be readily available at all times and updated regularly. The contact list also should include the name and number of the person (such as the office manager or the safety officer) who may have additional information regarding individual employee duties.

Developing and maintaining a relationship with local emergency authorities is vital. Trained fire personnel can often identify hidden workplace hazards and advise you in correcting them. Most local fire departments will come to your office and assess for fire hazards at your request.

▶ Chemical Safety

LO 7.5

A number of chemicals are used in a physician's office, and although most of these are found in the clinical lab area, they may be delivered to your office through the administrative office. If you are responsible for accepting a shipment containing chemicals, you must handle the package appropriately and make sure it is delivered to the proper person in the office. If laboratory personnel are not present when the order arrives, you must make certain that the chemical is properly

stored. The SDS is a good source of information regarding proper chemical storage and handling; consult the SDS and the packing slip on the container if you have questions.

If you are working in the lab, familiarize yourself with the SDS and hazard label of every chemical you will use during a procedure. If the SDS indicates the need for special equipment or conditions to use a chemical safely, be sure you meet the requirements before beginning to work with the substance. General precautions as you prepare include the following:

- Store caustic chemicals and other hazardous substances below eye level to reduce the risk of upsetting the container and spilling the substance into your eyes.
- Wear protective gear to prevent harm to your skin or damage to your clothing. (Be sure to properly remove the protective gear before leaving the laboratory.)
- Always carry chemical containers with both hands as you gather supplies.
- Make sure you work in a properly ventilated area.

When you are ready to begin work, adhere to these guidelines:

- If you must smell the chemicals you are using, do not hold them directly under your nose. Instead, hold them a few inches away and fan air across them and toward your nose.
- Work inside a fume hood if the chemical vapor is hazardous.
- Wear a personal ventilation device when working with certain chemicals, as specified by the SDS.
- Never combine chemicals in ways not specifically required in test procedures.
- Mouth pipetting is prohibited at all times.
- If you are combining acids with other substances, always add the acid to the other substance. Adding substances to the acid increases the risk of splashing.
- If you encounter a spill of an unknown chemical substance, do not pour any other chemicals on it. Clean it up following strict hazardous waste control procedures. Never touch an unknown substance with your bare hands.

If there is an eyewash station in your lab, OSHA recommends that you know where it is and be able to find it with limited or no vision. See Figure 7-6. All employees who may incur splashes or splatters should be trained in its use. The eyewash station should be checked monthly to make sure it is working properly. Procedure 7-2 demonstrates the proper use of an eyewash station.

► Ergonomics and Physical Safety LO 7.6

The medical office is a busy place, and it is sometimes easy to ignore basic safe practice when rapidly faced with multiple tasks. However, unsafe practice can have long-lasting effects on your health and quality of life. Protecting yourself from ergonomic and physical hazards ultimately reduces office costs by limiting unnecessary sick time. A safe employee is a valuable employee.

Ergonomics

Scientists study the way people work; this study is known as **ergonomics**. People who perform repetitive tasks often

FIGURE 7-6 Eyewash station.
© Aaron Roeth Photography

develop work-related musculoskeletal disorders. Workplace injuries also may be the result of poor posture while performing a task such as leaning over to lift a patient from a wheelchair instead of bending your knees or positioning your arms too far above the computer keyboard when keying information. Good ergonomic practice (sometimes called body mechanics) is designed to reduce the likelihood of injury at work. The CDC's National Institute for Occupational Safety and Health (NIOSH) has specific recommendations for reducing work-related musculoskeletal injuries:

- Do not overextend your reach when attempting to grasp supplies. Use only approved equipment, such as stepladders or stools, to reach high shelves. Do not climb onto chairs, desks, or tables to reach anything.
- When lifting an object, squat close to the object. Keep your back straight but not rigid. Lift the item by pushing up with your legs, not by pulling with your back. Hold the load firmly with both hands, close to your body. If necessary, put on a back-support belt before attempting to move heavy loads.
- When transferring a patient, always bend at the knees to lift and ask for assistance if you are not sure you can lift or move the patient by yourself. When performing the

transfer, move the patient's wheelchair as close to the exam table as possible to reduce the distance the patient must be moved. Lock the wheels of the wheelchair. Remove the wheelchair footrests if possible. Have the patient help as much as possible. If a transfer device is available, use it. Transfer devices include gait belts, sliding boards, pivot discs, and sling-type transfer equipment.

- Adjust your seat to the correct position to prevent back strain.
- If you are using a computer, take frequent breaks to reduce eyestrain and hand cramping.

Your employer has the responsibility to provide a safe work environment, including equipment designed to reduce injury and workstations that adjust to the worker. Many employers offer training seminars for reducing work-related injuries. It is your responsibility to follow safe practice when using equipment or performing tasks where there is a possibility of work-related injury.

Physical Safety

There are many ways to ensure physical safety in the medical office. You must understand and apply all the appropriate safeguards. Because accidents can happen, however, post emergency numbers in multiple locations throughout the office. Once each quarter, make sure the numbers are accurate and up-to-date.

Some safeguards come under the heading of common sense, meaning their application requires no special knowledge. These include:

- Walk, do not run, in the office.
- Prevent falls by wiping or mopping up spills immediately.
- Clear the floor of dropped objects.
- If the floor is carpeted, make sure there are no snags or tears that could cause someone to trip and fall.
- Spilled medications, chemicals, and other substances pose a threat to young children, who may ingest anything they find on the floor. Destroy and dispose of medications that are accidentally dropped on the floor.
- Be careful when carrying objects through the facility, especially when approaching blind corners.
- Close all cabinets, closet doors, desks, and worktable drawers.
- Routinely inspect the furniture in the exam room and reception area. Make sure there are no rough edges or sharp corners on the examining table, countertop, chairs, or other furniture.
- Electrical cords and medical and office equipment cables should run along the walls and be taped or fastened down securely.
- Never use damaged equipment or supplies, such as cracked or chipped glassware.

If you are asked to work in the laboratory, being aware of the laboratory environment will help you protect your health and well-being. Other safeguards to practice in the laboratory include

- Do not eat or drink in the laboratory, and do not store food there. Never use laboratory supplies, such as beakers or flasks, for eating or drinking.

- Do not put anything in your mouth while working in the laboratory. (Some people have a habit of chewing on the end of their pencils, for example.)
- Do not apply makeup or lip balm or insert contact lenses in the laboratory.
- Familiarize yourself with the location of the first-aid kit. If you are responsible for the kit in your area, check it weekly to make sure it is adequately stocked with supplies and that expiration dates on medications have not passed. See Figure 7-7.
- Familiarize yourself with the location and operation of the emergency eyewash and shower stations.

Additionally, in your efforts to promote safe practice in the laboratory, always wear appropriate protective gear and clothing. Use heat-resistant mitts or gloves to prevent burns. Wear sturdy, low-heeled, closed-toe shoes with rubber soles to prevent injury if you drop or spill something and to avoid slipping. Do not wear dangling jewelry or loose clothing that could get caught in laboratory equipment. Keep hair pulled back or covered for the same reason.

When you work with laboratory equipment, always follow manufacturers' guidelines. For example, wait for centrifuges to stop spinning before you open them.

Many laboratory materials and supplies require special handling and precautions, which include:

- Do not attempt to grasp bottles, jars, or other containers if your hands or the containers are wet.
- Close containers immediately after use.
- Clean up spills immediately.
- Clean up broken glass with a broom. Do not handle the debris. If the material is biohazardous, use tongs or forceps to pick up the glass. Package the pieces in a sturdy container with a label identifying the contents.

FIGURE 7-7 First-aid kit.

► Preventing Injury in the Front Office

LO 7.7

In addition to taking care of patients, medical assistants also must be aware of their environment in the medical office and how it affects their ability to perform the job effectively.

The medical office environment's many work functions require many physical tasks. Examples are using the computer, carrying and unpacking boxes, filling copy machine trays, and helping patients with impairments. The associated movements are often performed using repetitive motions, like typing, lifting, bending, stooping, and sitting.

The most common office-related injuries are those occurring to office workers, including medical assistants, who spend much of their workday seated at a computer station. Common injuries or conditions involve the forearm, wrist, hand, and back. Table 7-1 contains ergonomic excerpts from an OSHA computer station checklist to use in prevention of these common injuries.

The ideal medical office environment is an efficient, safe, and caring place for patients, visitors, and staff. You will find the *Caution: Handle with Care* feature helpful in preventing carpal tunnel syndrome (CTS), as well as identifying the symptoms and treatments for CTS, should it occur.

TABLE 7-1 OSHA Computer Workstations Checklist

1. Head and neck to be upright, or in-line with the torso (not bent down/back).
2. Head, neck, and trunk to face forward (not twisted).
3. Trunk to be perpendicular to floor (may lean back into backrest but not forward).
4. Shoulders and upper arms to be in-line with the torso, generally about perpendicular to the floor and relaxed (not elevated or stretched forward).
5. Upper arms and elbows to be close to the body (not extended outward).
6. Forearms, wrists, and hands to be straight and in-line (forearm at about 90 degrees to the upper arm).
7. Wrists and hands to be straight (not bent up/down or sideways toward the little finger).
8. Thighs to be parallel to the floor and lower legs to be perpendicular to floor (thighs may be slightly elevated above knees).
9. Feet rest flat on the floor or are supported by a stable footrest.
10. Backrest provides support for your lower back (lumbar area).
11. Seat width and depth accommodate the specific user (seat pan not too big/small).
12. Seat front does not press against the back of your knees and lower legs (seat pan not too long).
13. Seat has cushioning and is rounded with a "waterfall" front (no sharp edge).
14. Armrests, if used, support both forearms while you perform computer tasks and they do not interfere with movement.
15. Keyboard/input device platform(s) is stable and large enough to hold a keyboard and an input device.
16. Input device (mouse or trackball) is located right next to your keyboard so it can be operated without reaching.
17. Input device is easy to activate and the shape/size fits your hand (not too big/small).
18. Wrists and hands do not rest on sharp or hard edges.
19. Top of the screen is at or below eye level so you can read it without bending your head or neck down/back.
20. User with bifocals/trifocals can read the screen without bending the head or neck backward.
21. Monitor distance allows you to read the screen without leaning your head, neck, or trunk forward/backward.
22. Monitor position is directly in front of you so you don't have to twist your head or neck.
23. Glare (for example, from windows, lights) is not reflected on your screen, which can cause you to assume an awkward posture to clearly see information on your screen.
24. Thighs have sufficient clearance space between the top of the thighs and your computer table/keyboard platform (thighs are not trapped).
25. Legs and feet have sufficient clearance space under the work surface so you are able to get close enough to the keyboard/input device.
26. Document holder, if provided, is stable and large enough to hold documents.
27. Document holder, if provided, is placed at about the same height and distance as the monitor screen so there is little head movement, or need to re-focus, when you look from the document to the screen.
28. Wrist/palm rest, if provided, is padded and free of sharp or square edges that push on your wrists.
29. Wrist/palm rest, if provided, allows you to keep your forearms, wrists, and hands straight and in-line when using the keyboard/input device.
30. Telephone can be used with your head upright (not bent) and your shoulders relaxed (not elevated) if you do computer tasks at the same time.
31. Workstation and equipment have sufficient adjustability so you are in a safe working posture and can make occasional changes in posture while performing computer tasks.
32. Computer workstation, components, and accessories are maintained in serviceable condition and function properly.
33. Computer tasks are organized in a way that allows you to vary tasks with other work activities, or to take micro-breaks or recovery pauses while at the computer workstation.

CAUTION: HANDLE WITH CARE

Carpal Tunnel Syndrome

As the number of computers used in the home and workplace has escalated in recent years, the number of cases of carpal tunnel syndrome also has risen dramatically. Carpal tunnel syndrome is a hand disorder often associated with computer use. The term for this condition comes from the name for a canal (the carpal tunnel) located in the wrist. Several tendons pass through this tunnel, allowing the hand to open and close.

Carpal tunnel syndrome results from repetitive motion, such as keyboarding, for hours at a time. This motion may cause swelling to develop around the tendons and carpal tunnel. The swelling compresses the nerve. The people most likely to develop this disorder are workers whose jobs require them to perform repetitive hand and finger motions.

Symptoms

The symptoms associated with carpal tunnel syndrome include

- Tingling or burning in the hands or fingers.
- Weakness or numbness in the hands or fingers.
- Hands that go to sleep frequently.
- Difficulty opening or closing the hands.
- Pain that stems from the wrist and travels up the arm.

Tips for Prevention

If you use a keyboard for extended periods, you should practice proper techniques, as outlined in the following bullets, to prevent carpal tunnel syndrome (Figure 7-8).

- While seated, hold your arms relaxed at your sides. Make sure your keyboard is positioned slightly higher than your elbows. As you input, keep your elbows at your sides, and relax your shoulders.
- Use only your fingers to press keys and do not use more pressure than necessary. Use a wrist rest and keep your wrists relaxed and straight.
- When you need to strike difficult-to-reach keys, move your whole hand rather than stretching your fingers. When you

need to press two keys at the same time, such as “Control” and “F1,” use two hands.

- Try to break up long periods of keyboard work with other tasks that do not require computer use.

Tips for Relieving Symptoms

If you have carpal tunnel syndrome symptoms, try these suggestions for relief:

- Elevate your arms.
- Wear a splint on the hand and forearm.
- Discuss your symptoms with a physician, who may prescribe medication.

FIGURE 7-8 Maintaining proper posture and hand position helps avoid straining of the neck, back, arms, and eyes when using a computer.

Special Safety Precautions Some patients, such as children and people with disabilities, may be particularly susceptible to accidents in your office. You need to take special precautions to ensure their safety.

Children Follow these precautions when assisting children:

- Keep sharp instruments out of the reach of children.
- Store toxic items in high cabinets.
- Keep all medications and objects out of the reach of young children because children are likely to pick up items and put them in their mouths and could choke or be poisoned.
- Keep children's toys and books in the reception area or exam room picked up and stored safely when not in use.

- Toys should be washable and made of safe materials.
- Sanitize toys that children put in their mouths daily; sanitize other toys weekly.
- If well children and sick children use the same reception area or exam room, sanitize and disinfect toys after sick children play with them.
- Periodically check toys for sharp edges that might cause cuts.
- Ensure toys do not have small parts or pieces that could cause choking if swallowed.

Patients with Physical Disabilities Patients with disabilities are more likely than other patients to fall. Some patients may use walkers or canes for support, whereas others

may simply be unsteady on their feet. Follow these recommendations when assisting patients with physical disabilities:

- Provide assistance as needed with disrobing prior to an exam or redressing afterward.
- Never leave severely disabled patients alone in an exam room. Check office policies for guidelines regarding appropriate chaperones for patients with disabilities.

In addition, keep in mind that patients with vision impairments may have difficulty seeing obstacles, stairs, and other potential hazards. Safe flooring and handrails in the reception area, bathroom, hallways, and exam room help ensure the safety of patients with impaired mobility or vision.

► Design of the Reception Area LO 7.8

The word *reception* means the place or event where one is greeted. In the medical office, *reception* describes the area where the patient enters the practice, informs the staff of his or her presence by “signing in,” receives a greeting, and waits to be seen. Avoid using the term *waiting room*, since waiting is only one function and the term does not have a positive association. Although the practice manager is usually responsible for the office design, awareness of the aspects that affect the design is valuable knowledge for any medical assistant. The primary consideration in the design is the type of practice. For example, the furnishings, colors, and patient flow patterns of a pediatric office will differ from those of an internal medicine office.

Size and Schedule

After identifying the type of practice, size is the next factor. Knowledge of the number of practitioners and the number of patients anticipated daily is important. Knowing when individual physicians plan to utilize the space is equally important. For example, one surgeon in the practice may have office hours on Mondays, Wednesdays, and Fridays and perform surgeries on Tuesdays and Thursdays. Another surgeon may perform surgeries in the morning and see patients in the afternoon. These differences in physician scheduling allow better utilization of space and relative ease in planning for the reception size. Other offices may have staggered hours where one physician will see patients between 7:00 a.m. and 3:00 p.m. and another physician in the practice will see patients from 11:00 a.m. to 7:00 p.m. This is challenging, since more space is needed during the 4 overlap hours than the remainder of the day. Dealing with overlapping office hours and other time and space issues is often part of the medical assistant’s role.

Utilization of Space

Utilization of space differs by type of practice. For example, an orthopedic office or geriatric office where a significant number of patients will need room for wheelchairs and walkers requires more open space for mobility and devices than does a cardiologist’s office. There may be the false assumption that pediatric offices need a smaller reception area, since the patients are smaller, but this is incorrect for a few reasons. First, a caregiver always accompanies the pediatric patient. Second, children require play space. Third, pediatric offices may need separate

“well child” and “sick child” areas in an attempt to avoid cross-contamination from sick to well patients.

Overcrowding in a reception area is undesirable for patient comfort and for the potential of disease transmission. The reception area, which allows the patient to sit while waiting to be seen, is usually separated from the functional areas of the practice by a high counter and a sliding window (Figure 7-9). These areas should be HIPAA-compliant so the patient at the counter cannot overhear staff talking to or about other patients and cannot view an open computer screen or paper record.

Décor

Colors and fabrics are the primary elements that make up a room’s décor. Colors can be used throughout the room—on walls, furniture, carpeting, and other items. Fabrics are used primarily on furniture and draperies.

When using several colors, it is important to decorate in color families to avoid a jarring, unprofessional look. A **color family** is a group of colors that work well together. In general, colors fall within two basic areas: cool and warm. Using all cool colors—such as white, blue, and mauve—creates a more harmonious impression in the reception area than mixing cool colors with warm ones such as red, orange, and hot pink. When choosing the color family, consider the mood you want to create, as studies demonstrate that the use of color affects mood. For example,

- Red increases heart rate and blood pressure.
- Blue causes the body to produce calming chemicals.
- Green is easy on the eyes and relaxing.
- Light browns are warm and inviting.
- Black and dark browns are associated with power and depression.
- White is related to cleanliness and purity.

Traditionally, the pediatric office incorporates primary colors for a lively atmosphere (although the use of red should

FIGURE 7-9 The receptionist’s desk and window are part of every patient reception area and allow for privacy during patient check-in.

© Thinkstock Images/Getty Images RF

be limited). Obstetric offices are often decorated in pastels; geriatric offices often use soft colors in beige tones. Other offices tend to use popular decorator color palettes like earth tones and jewel tones (Figure 7-10). Colors may also reflect the cultural preferences of the dominant patient population. You might also want to consider the effect of color when choosing your scrubs or other office attire.

Fabrics, too, add to the atmosphere in the room. Heavy fabrics like velvet or brocade are more formal, whereas lightweight or sheer fabrics create a soft, delicate appearance. Patterns on fabrics or wallpaper can immediately change the mood of the room. No matter what the design, fabrics should be easy to clean and maintain.

Many medical offices are carpeted for greater appeal and improved noise reduction. Carpeting, available in a variety of colors and patterns, also provides a comfortable cushion when people walk through the office. Carpeting should be easy to clean and durable enough to handle a large volume of patient traffic. Scatter rugs, which can cause injuries if someone slips on or trips over them, should be avoided.

Furnishings

Chairs should be comfortable but have a straight back to allow the patient to get up easily, especially in obstetric, geriatric, and orthopedic offices. Many attractive stain-resistant cloth fabrics are available for medical use. Choose chairs and tables with rounded—not sharp—corners to avoid injuries.

Arranging Furniture The furniture arrangement can make the office seem comfortable or uncomfortable. If furniture is too close together, patients do not have sufficient space to move around easily or to stretch their legs. They may feel cramped. To ensure that patients have adequate room, a good rule of thumb is to allow 12 square feet of space per person. By this measurement, a 120-square-foot room (10 feet by 12 feet) can accommodate 10 people comfortably.

FIGURE 7-10 Decorator colors and furniture groupings make for a comfortable reception area.

© John Connell/Corbis RF

The furniture arrangement should allow maximum floor space. Patients should be able to stretch out their legs when seated and to walk around the reception area if they wish. Placing chairs against the wall usually produces the greatest amount of floor area. Additional seating in the middle of the room can be placed back-to-back to conserve space. Seats should be grouped so that families or friends can sit together. Remember to reserve room for patients in wheelchairs and to allow enough space for wheelchairs with extended leg supports. Also, keep in mind that some patients value their privacy; placing single chairs or small groups of chairs in corners of the room offers patients some measure of privacy, if needed.

Specialty Items Accessories or specialty items can make the reception area more comfortable and inviting. The following are additional items to be considered when selecting or modifying medical office furnishings:

- Artificial plants and floral arrangements are preferred due to allergies, poisons, and the potential for microbes associated with living plants; these should be kept dust-free.
- Aquariums are popular and soothing but require upkeep. Some offices employ a service to care for the aquarium; others have virtual aquariums.
- Heavy objects like large aquariums should be built into a wall if possible or securely fastened and stabilized to avoid injury. Likewise, large pictures, shelving, and bookcases should be securely fastened to walls.
- Toys and toy pieces should be easily and frequently disinfected and be larger than would fit into a small child's mouth. Balls and other throwing toys are dangerous in the medical environment.

Although specialty pieces can enhance the room's décor, they should be kept to a minimum. Too many pieces can create a cluttered look. Try to select specialty items that will be pleasing or helpful to patients. A clock is one example. Another useful item is a coat rack, which helps prevent clutter by providing a place for coats, umbrellas, and briefcases. Avoid accessories like scented candles or potpourri that may be offensive to some people or cause allergic reactions.

Other Considerations

Lighting Most medical offices use fairly bright lighting in the reception area, allowing patients to see their surroundings easily. Subdued lighting, like that sometimes used in restaurants, could be hazardous, as it may cause patients to trip over or bump into hard-to-see objects. In addition, bright lighting is essential for reading—a common activity in the patient reception area. Bright lighting also conveys an impression of cleanliness. Be aware, however, that extremely bright light can be harsh on the eyes and create an annoying glare.

Room Temperature Patients will be uncomfortable if the reception area is too hot or too cold. In an uncomfortable setting, waiting time can seem much longer than it really is, so maintaining an average, comfortable temperature is important.

To ensure a comfortable versus an uncomfortable temperature, keep the thermostat at a temperature that feels comfortable to you and to the office staff. You might periodically survey patients to see if they are comfortable and adjust the setting accordingly. Many elderly people feel cold because of lowered metabolisms. You may want to increase the temperature setting for a geriatric practice or if the office sees a large number of elderly patients. The room temperature in the reception area may be a bit cooler than in the examination rooms, where patients may be required to disrobe.

Music Many medical offices pipe soothing background music through speakers to the reception area as well as elsewhere in the office. Because the music is meant to calm patients, it should be chosen accordingly. Classical music, light jazz, and soft rock are appropriate choices, whereas heavy metal and rap music are not. Some offices use prepared compact discs. Others tune in to an “easy listening” local (or satellite) radio station.

Educational/Entertainment Materials

Practice-appropriate educational and entertainment materials are more likely to be read by patients if the materials are placed on tables close to the seating. While wall and countertop racks are appropriate and conserve space, keep some materials on tables for easier access by the elderly and differently abled (Figure 7-11). Magazines, newspapers, and other reading material also may be present. The publications should be relatively current and reflect the interests and languages of the populations served. Materials should be neatly arranged, tasteful, and not torn or dirty. Avoid tabloids. Some

large-print editions should be available for elderly and other sight-impaired patients.

Magazines and Books Choosing the right mix of reading material to interest all patients is a challenge. You probably have been in offices that have wonderful selections, and in an equal number of offices that do not. Try to have varied types of reading material to accommodate your patients’ broad range of interests. If your office sees teen and younger patients, be sure to include reading material for their interests, too.

You or someone on the office staff should be sure to screen publications for medical content so that you can alert physicians to articles that might stimulate patient questions. Make sure magazines are current. There is nothing worse than having a patient reception area full of outdated or worn magazines.

Patient Information Packet Many offices today compile a patient information packet to inform new patients about the practice. The packet can be designed in many ways, from a simple flyer to a formal folder with pockets to hold individual sheets of information. Topics covered in the packet can range from billing and insurance processing policies to biographical information on each physician in a group practice. The *Patient Education* chapter will discuss how to develop the contents of a patient information packet.

Medical Information Medical brochures are another type of reading material commonly found in the reception area. Patients may be interested in information that pertains to their general health or to specific conditions, particularly those that are treated by your physicians. Brochures on a variety of topics are available to medical offices either free of charge or for a nominal fee. These brochures are usually produced by nonprofit associations that specialize in a disease or condition (such as the American Cancer Society) and by pharmaceutical companies.

Before displaying pamphlets and brochures in the reception area, both you and the physicians may want to review them for medical accuracy and to prepare for any questions patients may have.

Bulletin Board Many reception areas contain bulletin boards that highlight area support group meetings and offer other current information. To encourage patients to look at the bulletin board, change the format and content frequently. Tailor items on the bulletin board to patient interests. Other, more general items for display on any physician’s bulletin board might include the following:

- Office policies and procedures for patients such as no smoking or eating in the patient reception area, late or missed appointment policies, and patient payment information
- Government reports on drug and nutrition information
- Pamphlets or flyers from nonprofit healthcare organizations such as the American Heart Association and requests from the American Red Cross or local blood bank for blood donors
- Flyers on upcoming health fairs, including blood pressure or other health screening opportunities

(a)

(b)

FIGURE 7-11 (a) Magazine racks save space, but do not forget to have (b) some reading material on tables for elderly or differently abled patients.

© Fuse/Getty Images RF, © Indeed/Getty Images RF

- Newspaper or magazine articles on interesting medical issues pertinent to the practice specialties
- Community notices for food drives or similar charity events
- Current information about practice staff and their accomplishments

Finally, the bulletin board is an ideal place to display the office brochure. Put some extra copies of the brochure in an open envelope tacked to the bulletin board to encourage patients to take one home. To keep the bulletin board up to date, all time-sensitive materials, such as notices about a class or seminar, should be removed as soon as the date of the scheduled event has passed (Figure 7-12).

Television and Videos

Although reading remains the traditional pastime in patient reception areas, watching television and DVDs is a common activity in physician offices across the country. Many patient reception areas now include a television, which can be tuned to regular or satellite news or entertainment stations or can play preselected videos. Physicians may provide informative healthcare videos of general interest to their patients or videos that meet the more specific interests of the practice. Videos are helpful for patients with limited reading ability and can be helpful if customized for non-English speakers.

Accommodating Children

A pediatric reception area caters to a unique age group of patients. To accommodate this specialized clientele, in addition to regular chairs, child-size chairs may also be available. Playhouses or play furniture, such as small tables, are also appropriate choices. The use of bright colors and storybook characters can also help to make the décor appealing to young children. It is important to make the setting feel familiar and comfortable. The reception desk may stock rolls of stickers or other inexpensive prizes to give to young patients after they have seen the doctor. As mentioned earlier, many pediatric offices have

found it helpful to include two reception areas—one for well visits and one for children who are potentially **contagious**—to separate the sick children from those who are well.

Because children—even sick ones—do not usually like to sit still for long periods, you may want to consider including toys, games, videos, and books in the pediatric reception area. If this reception area separates sick children from well children, the “well” side may include more active entertainment, like an indoor slide or playhouse, while the “sick” side may provide quieter games and activities, like books and puzzles.

Choose toys carefully. You do not want children—even well ones—to be too active in the reception area because they might disrupt other patients and their families. Avoid balls, jump ropes, and other toys meant for outside use. Puzzles and blocks are good choices because they encourage quieter play. All toys should be easy to clean (a bleach-water solution or nonaerosol disinfectant can be used) and, for safety and health reasons, should not include stuffed animals. Stuffed animals are not appropriate because they are difficult to keep clean and can be a source of infection. Their small parts can also pose a choking hazard. You might informally ask parents and children if they like the play items or if they would prefer other types of toys. Procedure 7-3 explains how to set up a pediatric reception area.

► The Importance of Cleanliness

LO 7.9

No matter how tastefully it is decorated, the reception area will be unappealing if it is not clean. Patients expect a physician’s office to maintain a high standard of cleanliness. The perception is that a messy or dirty reception area or patient bathroom reflects a practice that does not meet minimum standards for cleanliness. A practice with a spotless, attractive reception area reassures patients that they have chosen a practice with high standards of cleanliness. Another reminder of these high standards is the availability of alcohol-based hand rubs for patient use in the reception area (as well as in patient treatment areas) with directions for their use.

Housekeeping

Keeping the patient reception area neat and clean usually falls within the medical assistant’s duties. In most cases, you will be responsible for supervising the work of a professional cleaning service. In a small medical office, you may be required to clean the area yourself, using appropriate antibacterial agents and a vacuum. Cleaning should occur daily, with emergency cleanups as needed.

Because professional services generally clean in the evening after business hours, you will probably not be present while the housekeeping staff is working. You may be asked to provide feedback to the cleaning company, however. It also may be your responsibility to outline the tasks you expect workers to complete, including any special requests.

One way of communicating with the cleaning staff is to create a Cleaning Communications Notebook. Arrange with the cleaning staff to leave the notebook open every evening in the same place. Date all entries. Write short, concise directions about any special requests for cleaning. Describe the nature of any stain so the service can best treat it. Sign each entry.

FIGURE 7-12 Keep the office bulletin board neat, current, and uncluttered so the information remains of interest to the patients.

© Rob Melnychuk/Getty Images RF

Be sure to comment when something is done especially well. Like all of us, your cleaning staff likes to hear when they have done a particularly nice job.

Tasks Although housekeeping tasks vary from office to office, basic routines are applicable to areas like the patient reception room. The *Caution: Handle with Care* section gives more information about maintaining a clean reception area.

Whether or not the office employs a professional cleaning service, you or another staff member will need to check for cleanliness throughout the day. As patients spend time in the office, items may become soiled or be moved out of place. Taking time between patient appointments or at midday to spot-clean small areas that no longer appear “spotless” and to neaten items will help keep the patient reception area pleasing to the eye.

Equipment If you, and not a professional service, are responsible for cleaning, the person in charge of the office budget will approve the purchase of cleaning equipment and supplies. Examples of cleaning equipment include handheld and upright vacuums, mops, and brooms. Supplies include trash bags, cleaning solutions, cleaning rags, and buckets. It is a good idea to have some basic cleaning materials on hand in case an emergency cleanup job is needed during office hours. Always wear gloves when doing cleaning of any kind and use OSHA guidelines for safety. Be sure to also obtain the SDS

for any cleaning materials stored in the office and insert the sheets in the office SDS binder.

Removing Odors

Odors are particularly offensive in a medical office because people who are sick are often affected more severely by strong odors. Because patients are in the office for a scheduled appointment, they cannot suddenly leave to escape the odor. Some odors that may occasionally be present in a medical practice include those of urine, feces, vomit, body odors, and laboratory chemicals. A good ventilating system with charcoal filters can help minimize odors. If the system has temporary high-speed blowers, they can be activated as well. Disinfectant sprays and deodorizing sprays also may help, but deodorizers should be used sparingly, as more and more people are developing allergies to many of the scents used to mask odors.

One odor that can be prevented is smoke. Display “Thank You for Not Smoking” signs prominently in the patient reception area. Many offices, particularly those located in large buildings or attached to hospitals, are “nonsmoking zones.” Smokers who visit these offices must leave not only the office but the grounds, too, if they insist on smoking. This common rule is simply because not only does smoking produce an offensive odor, it also may affect the health of other patients in the reception area. People with asthma or other breathing disorders, or who are feeling unwell for any reason, are

CAUTION: HANDLE WITH CARE

Maintaining Standards of Cleanliness in the Reception Area

Cleanliness is (and should be) one of a medical office’s hallmarks. Not only is cleanliness required in the examination and testing rooms, it is also expected in the patient reception area. A messy patient reception area reflects badly on the practice. Patients may think, “If they don’t care about this, what else do they not care about?” Maintaining standards of cleanliness helps ensure that the reception area is presentable and inviting at all times.

As a medical assistant, you may be involved—along with the physician, office manager, and other staff members—in setting the office’s cleanliness standards. Standards are general guidelines. In addition to setting standards, you will need to specify the tasks required to meet each standard. You also may want to create a checklist of the tasks required to meet all of these standards.

The following list outlines standards you may want to consider. Specific housekeeping tasks for meeting those standards are included in parentheses.

1. Keep everything in its place. (Complete a daily visual check for out-of-place items. Return all magazines to racks. Push chairs back into place.)
2. Dispose of all trash. (Empty trash cans. Pick up trash on the floor or on furniture.)
3. Prevent dust and dirt from accumulating on surfaces. (Wipe or dust furniture, lamps, and artificial plants. Polish doorknobs. Clean mirrors, wall hangings, and pictures.)

4. Spot-clean areas that become dirty. (Remove scuffmarks. Clean upholstery stains.)
5. Disinfect areas of the reception area if they have been exposed to body fluids. (Immediately clean and disinfect all soiled areas.)
6. Handle items with care. (Take precautions when carrying potentially messy or breakable items. Do not carry too much at once.)

After the standards have been established, type and post them in a prominent place for the office staff (but not the patients) to see. The cleaning activities checklist may be posted, but the person responsible for cleaning the office also should keep a copy. It is everyone’s duty to keep the office looking clean and presentable.

A schedule of specific daily and weekly cleaning activities also should be posted. Less frequent housekeeping duties, like laundering drapes, shampooing the carpet, and cleaning windows and blinds, can be noted in a tickler file so that they will be performed on a regular basis.

It is always a good idea to have a second staff member responsible for periodically working with the medical assistant on housekeeping responsibilities. That person also may be responsible for handling cleaning duties when the medical assistant is away from the office.

particularly sensitive to smoke and strong odors. It is up to the healthcare facility and its employees to protect their health while in the medical office and its grounds.

Infectious Waste

There may be times when you will need to clean up infectious waste. **Infectious waste**, also known as biohazardous waste, is waste that can be dangerous to those who handle it or to the environment. Infectious waste includes human waste, human tissue, and body fluids such as blood and urine. It also includes any potentially hazardous waste generated in the treatment of patients, such as needles, scalpels, cultures of human cells, and dressings.

Although infectious waste is not commonly generated in the patient reception area, it can happen—for example, when a patient vomits or bleeds on the rug or on furniture. If that situation should occur, you must clean up the waste promptly. Remember, infectious waste must be handled in accordance with federal law and following OSHA guidelines. Your office may choose to purchase commercially prepared hazardous waste kits for use in cleaning up spills. After cleaning infectious waste from the patient reception area, deposit it in a biohazard container. Disinfect the site to eliminate possible contamination of other patients. Refer to the chapter *Infection Control Fundamentals* to review OSHA guidelines and standard precautions.

► Office Access for All

LO 7.10

The path patients must take to get from the parking area or street to the office and then back out again is called the office access. Some offices have easier access than others, but ease of access is important to your patients, particularly those who are older or differently abled (see Figure 7-13).

Parking Arrangements

Although some patients walk to the medical office or take public transportation, the majority of patients will probably travel by their personal vehicles. Patients who drive to the office need a place to park.

FIGURE 7-13 All patients should have access to ample parking and easy access to the office.

© McGraw-Hill Education. David Moyer, photographer

The office can offer either on-street parking or a parking lot or parking garage. On-street parking requires patients to fend for themselves. They may have to put money into parking meters, and parking spaces may be difficult to find. Both the money required and the potential problems in finding parking spots limit the ease with which patients can gain access to the office.

On the other hand, a free parking lot or parking garage improves office access. Parking lots and garages should be well lit for safety. The number of spaces needed depends on the number of patients scheduled for a specified time period and the average amount of time they spend in the facility. If patients generally spend an hour at the facility and 10 patients are scheduled per hour, then you will need no fewer than 10 parking spaces. Keep in mind that you will need to account for patients who spend more time in the office, and you will need a parking space for each staff member. Periodically reevaluate the office's parking needs because they may change over time. All offices must also provide handicapped parking spaces for patients. Visit http://www.adaptiveaccess.com/handicap_parking.php for more information on handicapped parking. You will read more about patients with special needs later in the chapter.

Entrances

The entrance to the office should be clearly marked so that patients can find the office easily. The name of the practice and of the physician(s) should be on the door or beside the door. Just outside the doorway should be a doormat to help control the amount of dirt tracked into the office. If the office door opens directly to the outside, people inside will feel a sudden change in temperature each time the door is opened in hot or cold weather. A foyer or double-door arrangement helps minimize the weather's effects by keeping the office at a consistent, comfortable temperature. All doorways must be wide enough to accommodate patients using wheelchairs and walkers. Hallways should be well lit and without obstructions.

Safety and Security

Safety and security are important concerns in any public building, and they are especially important for a medical office. To ensure both patient and staff safety, including protection from hazardous wiring or poorly lit hallways, there are guidelines for businesses, some of which pertain to the patient reception area. The medical office also must be secure from burglary.

Building Exits Make sure you and the office staff members are familiar with *all* building exits. As you learned earlier in the chapter, it may be necessary to leave the office quickly, as during a fire, flood, or other emergency. Refer to the instructions in Emergency Action Plans and Drills, discussed earlier, for more information about office exits and evacuating the office.

Security Systems No matter where the medical office is located, a security alarm system is a wise investment, even if security personnel patrol the office building. A security alarm system offers valuable protection for the confidential patient information housed in a medical office. After the alarm system is installed, all office staff members should thoroughly familiarize themselves with it. They should be able to arm and

disarm it easily and know what to do if it is accidentally activated. Each staff member should have her or his own individually assigned security access code. This number is required to authorize locking or unlocking the system. Like a credit card, bank, or other security PIN (personal identification number), it should never be shared.

Considerations for Patients with Special Needs

Some patients who come into the medical office will be disabled; that is, they were born with or have acquired a condition that limits or changes their abilities. A more positive way to refer to these patients who are differently abled is the use of the term *special needs*. For example, people who are paralyzed from the waist down have special needs; so do people who are visually impaired. This does not mean that these people cannot perform the same tasks that other people can; they may simply need special accommodations to do so. With some forethought and planning, the office can appropriately accommodate special needs patients. Ensuring wheelchair access through doors and hallways, as mentioned earlier, is just one way. Using ramps instead of steps, as shown in Figure 7-14, allows easier access not only for wheelchair users but also for others who have limited mobility. Allowing additional space in the reception area for wheelchairs, walkers, crutches, and guide dogs accommodates several types of special needs patients. Procedure 7-4, found at the end of the chapter, explains how to organize the patient reception area to meet the special needs of patients who are physically challenged. For more information on meeting the needs of the differently abled, visit the Adaptive Access website at <http://www.adaptiveaccess.com/index.php>.

Americans with Disabilities Act Individuals with special needs are often singled out for their differences and are sometimes discriminated against. For example, if a company building does not have access ramps for wheelchairs, workers in wheelchairs cannot qualify for jobs there. This would

FIGURE 7-14 Ramps allow people using wheelchairs and other assistive devices easier access to the office.

© Patrick Clark/Getty Images RF

violate the **Americans with Disabilities Act (ADA)**, which prevents discrimination based solely on a person's physical or mental disability.

Passed in 1990, this federal act is sometimes referred to as the civil rights act for people with disabilities, since it forbids discrimination based on physical or mental disabilities. The intent of the ADA is to provide equal access and reasonable accommodation in several important areas, including employment, facilities, sports, and education. The two sections involving medical practices are employment (discussed in the *Practice Management* chapter) and facilities. The following are required and reasonable facility accommodations:

- Handicapped parking
- Wheelchair ramps
- Wheelchair-accessible doors, halls, and bathrooms
- Handrails in halls and bathrooms
- Handicapped bathrooms including toilets, sinks, and room for a wheelchair to turn
- Braille elevator floor indicators
- Large-print patient forms
- Devices to communicate with the hearing impaired, as discussed in the *Telephone Techniques* chapter

Service Animals A service animal may accompany a patient with special needs (Figure 7-15) into a medical office or facility. The dog is the most common service animal, but cats, monkeys, and even miniature ponies are in use. Service animals wear a special vest that identifies them and they should have a certification. Remember that these animals are not pets and should not be distracted while “on duty.” Service animals are well behaved and calm unless their charge appears to be threatened.

FIGURE 7-15 Service animals should not be disturbed or distracted when working.

Vision and Hearing Impairments Although they should, there are still many offices that do not make special accommodations for patients with vision or hearing impairments. As a medical assistant, you can do your part in the office by posting prominent signs in the reception area with information that patients need to know. A staff member should offer to assist patients with hearing or vision impairments as needed from the reception area to the examination room when it is their turn to see the doctor.

Patients who are hearing impaired may request the presence of a certified sign language interpreter to assist in communicating with the medical staff. If requested, federal law requires that the office provide and pay for this interpreter.

It is also helpful, but not required by law, to provide a device, also known as a telecommunications device for the deaf (TDD), for hearing-impaired patients. This specially designed telephone, formerly called a TTY (teletypewriter), looks very much like a laptop computer with a cradle for the receiver of a traditional telephone. The receiver is placed in the cradle and the hearing-impaired patient can then type the communication on the keyboard. The message can be received by another TDD or relayed through a specialty relay service.

Some states offer a relay service for patients with hearing impairments or speech disabilities. When an individual accesses this service through the TDD, the service then places the call using voice. It is important to understand that a relay service could call a medical office to make an appointment for a patient. The medical assistant needs to be careful to respond appropriately and not mistake the call as an unwanted marketing call. You will read about TDD in more detail in the *Telephone Techniques* chapter.

Preparing the Reception Area for a Child with Autism In a medical office, you will most likely have patients who have an autism spectrum disorder (ASD). Individuals with ASD have difficulty with communication and social interactions. Children with ASD are often affected by changes in routine or schedule and new environments and may have severe reactions to sensory overload from loud noises or bright lights. For this reason, patients with ASD may need special accommodations when visiting a medical facility. As a medical assistant, you can make the visit to the healthcare facility easier by

- Scheduling the appointment first thing in the morning or last in the afternoon.
- Reducing the number of other patients and staff the patient encounters.
- Keeping the lights in the reception area low.
- Turning the volume of music down or off in the room where a patient with ASD is located.
- Taking the patient to the exam room as soon as possible.
- Alerting the healthcare practitioner that the patient is ready.
- Using visual aids and stories to explain procedures.

Older Americans Act of 1965 The fastest-growing segment of the American population is the elderly. Like those who are differently abled, many elderly people face

discrimination. One reason for the discrimination may be that with age come medical conditions and disorders that create physical limitations.

Congress passed the **Older Americans Act of 1965** to eliminate discrimination against the elderly. Among other benefits, the act guarantees elderly citizens the best possible healthcare regardless of ability to pay, an adequate retirement income, and protection against abuse, neglect, and exploitation.

What does the Older Americans Act mean for the medical office reception area? If the practice serves elderly patients, the office staff must be sensitive to their special needs. The patient reception area should be as comfortable as possible for patients with arthritis, failing eyesight, and other common ailments of the elderly. Make sure there are a few straight-backed chairs located near the front door and near the examination rooms. These chairs are easier to get into and out of than soft sofas and offer greater back support than low chairs or couches with sinking cushions. In addition, arms on chairs provide support when sitting and standing for patients who are unsteady.

Place reading materials within easy reach of the chairs so that elderly patients do not have to get up from their chairs for them. Have large-print books and magazines available, if possible, for patients with poor eyesight. You also might offer magnifying glasses for patients who like to use them. In addition, make sure that the print on all office signs is large and easy to read. As stated earlier, the patient reception area and restrooms should be well lit to help everyone, including elderly patients, see more clearly.

Special Situations Patients in a medical practice are usually a diverse group of people. Their interests, needs, and medical conditions can have an impact on the design of the reception area.

Patients from Diverse Cultural Backgrounds The United States has long been called a melting pot because of its mixture of people and cultures. Each culture lends its own special qualities, and together the cultures combine to create a unique blend of people called Americans.

You may work in a neighborhood that has a distinct culture or one in which many cultures are represented. To help patients feel comfortable, make the reception area reflect aspects of the local cultural backgrounds whenever possible. This effort will help patients feel more welcome.

Suppose, for example, that the medical office where you work serves many Latino patients. Posting signs in Spanish and English acknowledges the fact that both languages are spoken in that neighborhood. Providing reading materials, such as newspapers and magazines, in a second language—for both adults and children—is another way to show respect and interest. Decorating the office for Spanish holidays in addition to American ones demonstrates that you care about what is important to patients. Displaying artwork created by local artists and artisans is another idea.

Patients Who Are Highly Contagious Patients may have to come into the physician's office when they are highly contagious. This fact is a concern for all patients, but it is

especially critical for patients who are immunocompromised. The immune system of an immunocompromised patient is not functioning at a normal level. Because these patients do not have the normal ability to fight off disease, they are at greater risk than the average person for becoming sick. Patients undergoing chemotherapy and patients with AIDS, for example, have compromised immune systems. Follow transmission-based precautions when dealing with any patient who is highly contagious.

► Functions of the Reception Staff **LO 7.11**

The person who works at the *front desk* is commonly called the receptionist. The receptionist's main function is to greet people, register them, give them direction, and answer the phone. In the past, people have taken the receptionist for granted, but truly, the receptionist is one of the most important people in the practice. Just as the reception area décor gives the patient his first impression of the office itself, it is the receptionist who gives the first impression of the office staff and sets the perception of the care the patient will receive from the medical staff. The multiple tasks the receptionist is responsible for provides the very basis for the patient's medical care and for the overall positive impression you wish to convey to your patients. It is her attitude and communication skills that create this positive (or negative) first impression. This staff member, who is frequently an administrative medical assistant, should immediately acknowledge and greet the arriving patient with a smile and pleasant voice. If the receptionist is on the phone, looking up at the patient with a smile and head nod is appropriate to acknowledge the patient and let him know she will be with him shortly. This small gesture will convey that the office staff is attentive and put the patient at ease from the start of the appointment.

Patient Registration and HIPAA

Patient registration is often referred to as patient check-in or sign-in. In many offices, upon arrival, patients are asked to “sign in” to notify staff that they are there. Two commonly used forms of check-in or sign-in are the paper version and the digital or electronic version. Both may include the arrival time, the appointment time, and the practitioner's name. As you read earlier, under HIPAA, personal health information (PHI) is considered private and confidential; however, the rules do state that sign-in sheets are allowable, as long as the reason for the visit is not included on the sign-in sheet. If the physician specialty is of a confidential nature (such as psychology or drug treatment), it is suggested that sign-in sheets not be used—by the very nature of seeing the practitioner, an “assumption” about the nature of the visit can be made.

If an electronic sign-in is utilized, two methods are approved:

- Providing a digital pad (similar to electronic debit or charge)
- Use of a computer in the reception area for patients to input information

Once the patient has signed in, the receptionist will provide him or her with appropriate forms. Returning patients may receive a copy of their information to update. Some offices will interview the patient, line-by-line, and input this information directly into the system. This method is usually more time-consuming than

having the patient provide hard copy and then inputting directly from the form. Regardless of which method is used, the information given should be reviewed with the patient.

New patients receive a complete new patient registration packet that includes

- Demographic/insurance coverage form.
- Authorizations for release of information to insurance carriers, assignment of benefits, and financial responsibility.
- Notice of Privacy Practices.
- Health history.
- Information regarding the payment and other policies of the practice.

The forms must be completed and signed. The patient's or insured party's insurance card and a picture identifier, such as a driver's license, are copied or scanned. The picture identifier is one method to help reduce healthcare fraud, by preventing a friend or family member who may not have health insurance from “borrowing” another insurance card. The ID should be checked every time the patient comes into the office. You will explore medical identity theft in more detail a bit later in this chapter. From the demographic and health information provided by the patient, the medical assistant initiates a medical record or electronic health record. The record may be totally electronic or a combination of electronic health record and hard-copy financial information or electronic financial information and paper health record. The components of the medical record are covered in the *Medical Records and Documentation* and *Electronic Health Records* chapters. When all forms are completed and signed, the appropriate clinical staff member is notified that the patient is ready to be seen.

Payment

Another reception responsibility is collecting the patient's insurance copayment, which is usually done prior to the visit. The amount of the copayment, if applicable, is usually shown on the patient's insurance card. Depending on the office, acceptable payment methods are cash, check, debit cards, and charge cards. Third-party checks should never be accepted, and any personal checks should be written for the exact amount. Cash and checks are kept in a cash drawer that is locked when the reception desk is unmanned. In some offices, the patient will return to the reception area after the visit and may make any payments due at that time. All financial transactions will be discussed in depth in the chapter *Patient Collections and Financial Management*. Follow-up and referral appointments are often also scheduled at the front desk. Once all patient transactions are completed, the receptionist should extend a pleasant farewell to all patients.

Observation and Updates

Another function of the front desk staff is to be observant. As discussed earlier, some patients should not sit in the main reception area. These include patients who are

- Having chest pain (adults).
- Experiencing shortness of breath.
- Bleeding.

- Feeling faint (syncope), dizzy, light-headed.
- Vomiting.
- Experiencing an undiagnosed or contagious rash.

If a patient complains of any of these symptoms, or if you notice a change in a patient's status, immediately notify a member of the clinical staff, who will determine where to place the patient. If you are concerned about the condition of any patient, do not hesitate to ask the clinical staff for advice.

As mentioned earlier in the chapter, the receptionist (or any office staff member) should address spills, trash, and any potential hazards—such as frayed cords, broken furniture, or tears in rugs—as quickly as possible. If the reception area becomes overcrowded, “traffic control” is required. Ensure chairs are not occupied with personal items and determine if there is room in treatment areas. Keeping patients updated if appointments are running late is another important function of the front office staff. If the wait time is significant, giving patients the option of rescheduling their appointments shows respect for the patient's time.

The Identity Theft Prevention Program

In many instances, HIPAA and medical identity theft go hand in hand. The person in the practice with the dual responsibility is generally the privacy or compliance officer. A three-pronged approach for the medical office's prevention program is recommended:

1. Prevention—implementing sound electronic and other security systems maintaining HIPAA compliance
2. Detection—staff training on what to look for and electronic “red flagging” such as automatic on-screen identification of a difference in date of birth
3. Mitigation—ensuring medical records of the perpetrator and the authentic patient are not co-mingled; the medical assistant should know what to look for in suspicious behaviors and both how to report such behaviors and how to find out if suspicious behavior by the patient has been previously reported

Opening and Closing the Office LO 7.12

You are learning that efficiency in the medical office is a result of good organization and adherence to office policies and procedures. These policies include establishing set procedures for opening and closing the facility. This is generally the responsibility of the staff member in the reception area. Following a set routine and using specially designed check sheets ensure no process is overlooked. Some offices perform specific tasks when opening the office, like restocking supplies, and other offices perform these tasks at closing. Let's take a general look at both of these procedures.

Beginning the Day

The person opening the office arrives approximately 30 minutes prior to the scheduled time for office operations to begin. Safety is a consideration. Be aware of the activity outside the office door such as persons in the parking area, elevators, or hallways. If you feel uncomfortable, notify the facility's security or await the arrival of another staff member. Laboratory specimens, such as blood, obtained by staff for delivery to reference laboratories are often placed in a special container on the office door or in the vicinity. Upon arrival in the morning, ensure the specimens were picked up from the previous day. Do not completely turn your back while unlocking the door. Once inside, deactivate the security system.

The first priority is accessing the answering service or answering machine to determine if any staff member may have called in with an emergency, patients have canceled appointments, patients need a same-day appointment, or hospitals reported patients seen during the night. Convey this vital information to the correct staff member as soon as possible. Other tasks may be to turn on a fax machine or coffee machine. Some offices divide the responsibility for the administrative areas and the clinical areas. Table 7-2, provides a general guideline for opening the medical office.

TABLE 7-2 Daily Checklist for Opening the Office

Daily Checklist for Opening BWW Medical Associates, PC						
	W/E _____					
	M	T	W	Th	F	S
1. Security system is disarmed.						
2. Voicemail/answering service messages are retrieved.						
3. Messages are routed and ready for callback.						
4. Computers are turned on.						
5. Appointments and insurance rosters are checked.						
6. If needed, charts are pulled and paperwork is attached.						
7. Equipment is working properly.						
8. Rooms are supplied and ready.						
9. Refrigerator temperature is checked.						
10. Emergency supplies, including O ₂ , are checked.						
11. Reception area is in order and patient education material is available.						
12. Lab specimens from the day before were picked up.						

TABLE 7-3 Daily Checklist for Closing the Office

Daily Checklist for Closing BWV Medical Associates, PC	W/E _____					
	M	T	W	Th	F	S
1. Computers are logged off and shut down.						
2. Contaminated supplies/equipment are properly disposed of or tagged for cleaning/sterilization.						
3. Areas are restocked.						
4. If needed, patient charts are pulled/reviewed for next day and all test results are available.						
5. Laboratory specimens are in pick-up receptacle.						
6. All office equipment is turned off (including kitchen).						
7. Reception area is neat and organized.						
8. Calls are forwarded to voicemail/answering machine.						
9. Medical records are secured.						
10. All doors and windows are locked.						
11. Security system is armed.						

Ending the Day

Table 7-3 includes typical duties for ending the day efficiently, which is just as important as beginning the day efficiently. It completes the day's responsibilities and sets the stage for the next day.

A person closing the office that has extended or split hours may not be the same person who opened the office, so cooperation and good communication are essential between staff members. Turn off equipment, such as the coffeemaker and the fax machine, if that is the office policy. Check exam rooms to be sure supplies are well stocked for the next day and give the reception room one last "look" to be sure it is neat and presentable for the morning patients. Ensure that confidential information is not in view for any cleaning or security personnel who may enter the office after hours. Notify the answering service that the office is closing or turn on the answering machine. Ensure laboratory specimens are placed in the proper container for pick-up. Activate the security system (Figure 7-16).

Be alert when exiting the building for any unusual or suspicious activity. Refer to Procedure 7-5, Opening and Closing the Medical Office, for practice on these procedures. Following consistent policies and procedures guarantees that important tasks are not forgotten and, in this case, ensures that the office, its equipment, medications, and its private information remain safe and secure at all times.

FIGURE 7-16 Arming the office security system is usually the final task to end the workday.

PROCEDURE 7-1 Handling a Fire Emergency

Procedure Goal: To ensure safe use of a fire extinguisher during a fire emergency

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Fully charged fire extinguisher that has been professionally serviced on a yearly basis

Method:

1. In the case of an open fire or continuous smoke, pull the fire alarm or call emergency services to alert the local fire authorities.
2. Move patients out of the area.
3. Remove the fire extinguisher from its stored location.

4. Assess the fire. If it is too large, do not attempt to extinguish the fire. Leave the building immediately and wait for the fire department to arrive.

RATIONALE: *You must determine if you can easily contain the fire so that you know whether to have everyone leave the building.*

If the Fire Cannot Be Easily Contained

5. Calmly and quickly ask each employee to follow the established fire plan.
6. Remove all patients to the outside of the building; ensure patient comfort and safety at all times.

If the Fire Is Small and Easily Contained

7. Hold the fire extinguisher upright.
8. Pull the safety pin on the fire extinguisher.

FIGURE Procedure 7-1 Step 8 To activate a fire extinguisher, pull the safety pin.

9. Aim at the base of the fire.

FIGURE Procedure 7-1 Step 9 You should aim at the base of the fire, not the flames. The source or fuel of the fire is at the base.

10. Squeeze the trigger.

FIGURE Procedure 7-1 Step 10 Once you are aiming at the base of the fire, squeeze the lever to deliver the extinguishing agent.

11. Sweep side to side until the fire is out.

FIGURE Procedure 7-1 Step 11 Sweep back and forth at the base of the fire until it is out.

12. Do not reenter the area until the fire department assesses and clears the area.

RATIONALE: *A professional firefighter should assess the area to ascertain if there is a danger of the fire reigniting.*

PROCEDURE 7-2 Maintaining and Using an Eyewash Station WORK // DOC

Procedure Goal: To ensure safe use of eyewash station following a splash or splatter accident

OSHA Guidelines:

Materials: Eyewash station. This may be plumbed or free-standing. Eyewash safety inspection record, gloves, moisture-proof lab coat, and goggles or face mask.

Method:

On a Weekly Basis

1. Check that the path to the eyewash station is clear and no more than 10 seconds from the hazard.
2. Ensure that the eyewash sign is easily visible.
3. Make sure the covers are in place.

RATIONALE: To ensure there are no contaminants on the eyewash

4. Ensure that the unit comes on in 1 second and stays on once it is activated.
5. Check the flow of the eyewash to ensure it has sufficient flow to wash the eye but is not so strong it will damage the eye tissues. Approximately 0.4 gallon per minute is required for an eyewash and 3 gallons per minute is required for an eyewash/facewash station.
6. Check that the temperature of the water is above 60°F and below 100°F.
7. Flush the system for 1 minute.

RATIONALE: To remove any particulate matter such as sediment from standing water that may have collected in the water line

8. Complete the Safety Inspection record attached to the eyewash station.

DATE	BY	DATE	BY
Jan 12	Juanita	Jan 19	Steven

FIGURE Procedure 7-2 Step 8 The safety inspection record should be completed each week.

During a Splash or Splatter Emergency

9. Help the victim to the eyewash station.
10. Activate the system.
11. If the eyewash is a plumbed unit, have the victim lean into the eyewash, keeping her eyes continuously open. You may have to don gloves and gown and assist the victim by holding her eye or eyes open.
12. Continuously flush the eyes for at least 15 minutes or the length of time recommended on the SDS if applicable.
13. Alert the physician or EMS.

RATIONALE: So that the victim receives prompt and appropriate postexposure care

PROCEDURE 7-3 Creating a Pediatric Reception Area

Procedure Goal: To create an appropriate environment for children in the patient reception area of a medical (pediatric) practice

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Children's books and magazines, games, toys, nontoxic crayons and coloring books, television and DVD player, children's DVDs, child- and adult-size chairs, child-size table, bookshelf, boxes or shelves, decorative wall hangings, or educational posters (optional)

Method:

1. Place all adult-size chairs against the wall. Position some of the child-size chairs along the wall with the adult chairs.

2. Place the remainder of the child-size chairs in small groupings throughout the room. In addition, put several chairs with the child-size table.
3. Put the books, magazines, crayons, and coloring books on the bookshelf in one corner of the room near a grouping of chairs.
4. Choose toys and games carefully. Avoid toys that encourage active play, such as balls, or toys that require a large area. Make sure that all toys meet safety guidelines. Watch for loose or small (smaller than a golf ball) parts. Toys should also be easy to clean.

RATIONALE: Helps ensure safety in the patient reception area

5. Place the activities for older children near one grouping of chairs and the games and toys for younger children near another grouping. Keep the toys and games in a toy box or on shelves designated for them. Consider labeling or color-coding boxes and shelves and the games and toys that belong there to encourage children to return the games and toys to the appropriate storage area.
6. Place the television and DVD player on a high shelf, if possible, or attach them to the wall near the ceiling.

Keep children's DVDs behind the reception desk, and periodically change the video in the DVD player.

RATIONALE: *Doing so helps ensure safety in the patient reception area, as DVDs and video equipment are easily damaged or destroyed by young patients. Young patients also may be harmed in trying to reach the equipment.*

7. To make the room more cheerful, decorate it with wall hangings or posters.

PROCEDURE 7-4 Creating a Reception Area Accessible to Patients with Special Needs

Procedure Goal: To arrange elements in the reception area to accommodate patients with special needs

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Ramps (if needed), doorway floor coverings, chairs, bars or rails, adjustable-height tables, magazine rack, television/DVD player, large-type and Braille magazines

Method:

1. Arrange chairs to create gaps that allow substantial space along walls and near other chair groupings for wheelchairs. Keep the arrangement flexible so that chairs can be removed to allow room for additional wheelchairs if needed.
RATIONALE: *To meet all the requirements of the Americans with Disabilities Act*
2. Remove any obstacles that may interfere with the space needed for a wheelchair to swivel around completely. Also, remove scatter rugs or any carpeting that is not attached to the floor. Such carpeting can cause patients to trip and creates difficulties for wheelchair traffic.
RATIONALE: *Helps ensure safety in the patient reception area*
3. Position coffee tables at a height and location accessible to people in wheelchairs.
4. Place office reading materials, such as magazines, at a height accessible to people in wheelchairs (for example, on tables or in racks attached midway up the wall).
5. Locate the television and DVD within full view of patients sitting on chairs and in wheelchairs so that they do not have to strain their necks to watch.

6. For patients who have a vision impairment, include large-type and Braille reading materials.

7. For patients who have difficulty walking, make sure bars or rails are attached securely to walls 34 to 38 inches above the floor, to accommodate requirements set forth in the Americans with Disabilities Act. Make sure the bars are sturdy enough to provide balance for patients who need it. Bars are most important in entrances and hallways, as well as in the bathroom. Consider placing a bar near the receptionist's window for added support as patients check in.

RATIONALE: *To meet all the requirements of the Americans with Disabilities Act*

8. Eliminate sills of metal or wood along the floor in doorways. Otherwise, create a smoother travel surface for wheelchairs and pedestrians with a thin rubber covering to provide a graduated slope. Be sure that the covering is attached properly and meets safety standards.

RATIONALE: *Helps ensure safety in the patient reception area*

9. Make sure the office has ramp access.

RATIONALE: *To meet all the requirements of the Americans with Disabilities Act*

10. Solicit feedback from patients with physical disabilities about the accessibility of the patient reception area. Encourage ideas for improvements. Address any additional needs.

RATIONALE: *Doing so lets patients know that their comfort and well-being are important to you.*

PROCEDURE 7-5 Opening and Closing the Medical Office

Procedure Goal: To ensure readiness and to receive and care for patients in an efficient, organized, and safe manner

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Checklist for opening and closing the office (Tables 7-2 and 7-3 may be used as samples), pen, telephone, and pad of paper

Method:

1. Using Table 7-2, Daily Checklist for Opening the Office, as a guide, simulate the functions of opening the office. Enter the week ending date.

RATIONALE: *Using a checklist ensures no task is inadvertently skipped.*

Daily Checklist for Opening BWW Medical Associates, PC	W/E					
	M	T	W	Th	F	S
1. Security system is disarmed.						
2. Voicemail/answering service messages are retrieved.						
3. Messages are routed and ready for callback.						
4. Computers are turned on.						
5. Appointments and insurance rosters are checked.						
6. If needed, charts are pulled and paperwork is attached.						
7. Equipment is working properly.						
8. Rooms are supplied and ready.						
9. Refrigerator temperature is checked.						
10. Emergency supplies, including O ₂ , are checked.						
11. Reception area is in order and patient education material is available.						
12. Lab specimens from the day before were picked up.						

FIGURE Procedure 7-5 Step 1 Use a daily checklist when opening the office.

- Begin by disarming the security system.
- Telephone the answering service to pick up messages or set the office answering machine or voicemail system to answer calls. Document any messages and notify the appropriate person of the call.
- Conduct each task on the form, placing your initials in the column for the correct day of the week.

RATIONALE: *It is important to know who performed each task in case questions arise.*

S U M M A R Y O F L E A R N I N G O U T C O M E S

LEARNING OUTCOMES	KEY POINTS
7.1 Describe the components of a medical office safety plan.	The medical office safety plan should include OSHA's Hazard Communication; electrical, fire, and chemical safety; emergency action plans; bloodborne pathogen exposure plans; PPE; and needlestick prevention plans.
7.2 Summarize OSHA's Hazard Communication Standard.	The US Department of Labor created OSHA to protect the employees' safety in the workplace. Through the creation and enforcement of standards such as the Bloodborne Pathogens Standard, Hazard Communication, and the Needlestick Safety and Prevention Act, OSHA serves to protect healthcare workers from hazards.
7.3 Describe basic safety precautions you should take to reduce electrical hazards.	To reduce electrical hazards in the medical office, you should avoid using extension cords, repair or replace damaged cords, avoid overloading circuits, ensure that all plugs are grounded, dry your hands before using electrical devices, and keep electrical devices away from sinks or other sources of water.
7.4 Illustrate the necessary steps in a comprehensive fire safety plan.	A comprehensive fire safety plan must include fire prevention strategies, actions to take in the event of a fire, building evacuation routes and plans, fire drills, and local emergency contacts.
7.5 Summarize proper methods for handling and storing chemicals used in a medical office.	When using chemicals in the medical office, you should always wear protective gear, carry the container with both hands, work in a well-ventilated area, never combine chemicals unless it is specifically required in the test procedures, always add acid to water if the procedure requires that you combine chemicals, and properly clean up spills immediately.
7.6 Explain the principles of good ergonomic practice and physical safety in the medical office.	In order to protect yourself from work-related musculoskeletal disorders at work, you must follow the principles of good body mechanics. Your physical safety at work depends on understanding and applying appropriate workplace safeguards, including never running in an office, taking care when carrying objects through the facility, closing cabinets and drawers, and following appropriate safety procedures in the lab.
7.7 Articulate the cause of most injuries to medical office workers and the four body areas where they occur.	Most office-related injuries are those associated with repetitive motions, such as typing, lifting, bending, stooping, and sitting. Common injuries or conditions involve the forearm, wrist, hand, and back.
7.8 List the design items to be considered when setting up an office reception area.	The size of the space you have to work with and the schedule of the physicians seeing patients must be considered first. Utilize the space to give as much room and privacy as possible. The décor should include a color family to suit the practice type. Furnishings should be comfortable but easy to get in and out of and easy to clean. Lighting should be appropriately bright to avoid accidental falls. Accessories like wall hangings, aquariums, coat racks, and magazine racks should complement the décor but not make the room feel cluttered. Current magazines and other reading materials on multiple topics should be available to entertain and inform the patient. TV and/or informational DVDs also may be played. If the practice sees children, special accommodations to entertain them also must be made.

LEARNING OUTCOMES	KEY POINTS
7.9 Summarize the housekeeping tasks required to keep the reception area neat and clean.	Housekeeping tasks for the reception area include overseeing the professional cleaning staff (if one is employed), keeping everything in its place, disposing of trash, preventing visible dust and dirt on surfaces, spot-cleaning areas that become soiled, disinfecting areas exposed to body fluids, and handling items with care. OSHA guidelines should be followed in all aspects of keeping the office neat and clean. Standards of office cleanliness should be created and posted for all staff to see.
7.10 Relate how the Americans with Disabilities and Older American Acts have helped to make physical access to the medical office easier for all patients.	The Americans with Disabilities Act and the Older Americans Act both prevent discrimination based solely on a person's physical or mental disability or his or her age. Both of these acts mandate accessibility for the differently abled, including, but not limited to, adequate parking for vehicles with and carrying assistive devices such as wheelchairs, ramps instead of stairs, wider doorways and hallways, well-lit areas throughout the office, large-print instructions, and Braille markings for elevators and other instructions.
7.11 Describe the functions of the front office staff, including patient registration and accepting payments from patients.	The front office staff greet people, register them, give them direction, observe and report when patients should be transferred quickly to the clinical area, and answer the phone. They may also accept payment for patient visits.
7.12 Implement policies and procedures for opening and closing the office.	Maintaining specific policies and procedures for opening and closing the office ensures the necessary tasks are completed daily in a uniform manner. This results in an efficient and prepared medical office each day.

CASE STUDY CRITICAL THINKING

© Image Source/Getty Images RF

Recall Peter Smith from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding his case.

1. How should you respond to Mrs. Smith's request that she be allowed to speak with Dr. Buckwalter privately?
2. Summarize your role as the "first person" Mr. Smith (and all patients) sees as he enters the office.
3. What action should you take to prevent Mr. Smith and possibly other patients from falling while trying to reach the magazines on the table?

EXAM PREPARATION QUESTIONS

1. (LO 7.8) When designing the reception area for a medical practice, the first consideration should be the
 - a. Color
 - b. Furnishings
 - c. Patient education material
 - d. Type of practice
 - e. Music
2. (LO 7.2) Which of the following are the sheets that must accompany every hazardous chemical?
 - a. GHS
 - b. HCS
 - c. SDS
 - d. OSHA
 - e. ADA

3. (LO 7.9) Which federal agency produces guidelines for maintaining office cleanliness and the SDS for cleaning solutions?
 - a. HIPAA
 - b. ADA
 - c. OSHA
 - d. FDA
 - e. DEA
4. (LO 7.10) A violation of the ADA might be not permitting
 - a. Smoking
 - b. Pharmacy refills
 - c. Charge cards
 - d. Service animals
 - e. Beverages in the reception area
5. (LO 7.2) OSHA requires that every facility keep a master list of hazardous chemicals in the facility. This is part of
 - a. Global System of Hazardous Chemicals
 - b. Hazmat Standard
 - c. DOT Safety Rule
 - d. Chemical Convention Rule
 - e. Hazard Communication Standard
6. (LO 7.7) Which injury may be caused by repetitive motions using a computer?
 - a. Eye strain
 - b. Scoliosis
 - c. Arthritis
 - d. Whiplash
 - e. CTS
7. (LO 7.4) PASS is an acronym for a system outlining the proper use of which of the following?
 - a. Fire extinguisher
 - b. Chemical hood
 - c. Gas-fed open flame
 - d. Alcohol-based hand disinfectant
 - e. Evacuation plan
8. (LO 7.2) Which of the following requires that all employees receive workplace hazard training?
 - a. Standard precautions
 - b. Emergency action plans
 - c. Needlestick prevention regulations
 - d. Hazard Communication Standard
 - e. Bloodborne Pathogens Standard
9. (LO 7.11) When the physician is running very late, the receptionist should
 - a. Inform patients they will be seen soon
 - b. Offer refreshments while the patients are waiting
 - c. Cancel appointments
 - d. Provide patients with the option to reschedule appointments
 - e. Avoid eye contact with waiting patients
10. (LO 7.6) The study of the way people work is known as
 - a. Economics
 - b. Kinesiology
 - c. Ergonomics
 - d. Posturing
 - e. Accommodation

SOFT SKILLS SUCCESS

You are working in the front office of a medical facility. The office is very busy; the reception area is full of patients waiting to be seen and you are currently on the phone when a man walks in and says he has to see the doctor immediately. You notice that the man is about 60 years old and appears very pale, is sweating, and is clutching his chest. What action should you take?

Office Equipment and Supplies

CASE STUDY

EMPLOYEE INFORMATION	Employee Name	Position	Credentials
	Miguel A. Perez	Administrative MA	CMA (AAMA)
EMPLOYEE INFORMATION	Supervisor	Date of Hire	Other information
	Malik Katahri, CMM	6/21/20XX	15th of month: order paper & administrative supplies for office

Miguel A. Perez is the CMA (AAMA) for BWW Medical Associates, PC, a busy medical practice, and he is the first to arrive each morning. This morning, as Miguel walks through the office, turning on the lights, he notices the fire extinguisher hanging on the wall. He makes a mental note to call the maintenance company today to notify them that the expiration date on the extinguisher is this month. They will replace the old one with a new extinguisher. Miguel quickly checks the late-night pick-up specimen boxes, notes the specimens left last evening were picked up by the lab, and removes the lab reports left in the box by the lab. He switches on the copier/scanner and makes sure the paper tray is full. The copier is leased and BWW Associates is billed monthly based on the number of copies made during the month. He will call the leasing company with the number

© Karen Moskowitz/Getty Images

today. He has an automatic reminder set up on his computer to do this on the 30th of each month. Next, Miguel turns on his computer and reviews his calendar and task list for the day. He has received e-mail from another practice asking about a new referral and an e-request for medical records. He prints out two computerized appointment listings for the day, placing

one in the front office and one in the back office for easy reference. Because medical records in the office are computerized, he is grateful paper charts no longer need to be pulled. He takes a quick look around the administrative office to identify any items that need to be restocked, and he restocks the supply of pens and forms at the reception desk. He then scans the reception area to make sure it is neat and ready for the day.

Keep Miguel in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

LEARNING OUTCOMES

After completing Chapter 8, you will be able to:

- 8.1** Identify common types of computers.
- 8.2** Describe computer hardware components and explain the functions of each.
- 8.3** Describe the types of software applications commonly used in the medical office.
- 8.4** Summarize the options available for learning computer software programs.
- 8.5** Recall the steps involved in selecting new or upgrading existing office computer equipment.
- 8.6** Outline the basic care and maintenance required for the office computer system.
- 8.7** Identify several reasons security is particularly important in the computerized office.
- 8.8** Explain the function of other types of administrative medical office equipment.
- 8.9** Outline the steps to be taken in deciding whether new office equipment is needed.
- 8.10** Explain the difference between a maintenance contract and a service contract.
- 8.11** Define vital, periodic, and incidental supplies.
- 8.12** Outline the steps in performing a supply inventory.
- 8.13** List the items that should be considered when choosing a vendor for supply ordering.

CAAHEP

- V.C.8** Discuss applications of electronic technology in professional communication
- VI.C.9** Explain the purpose of routine maintenance of administrative and clinical equipment
- VI.C.10** List steps involved in completing an inventory
- VI.C.11** Explain the importance of a data back-up
- VI.P.8** Perform routine maintenance of administrative or clinical equipment
- VI.P.9** Perform an inventory with documentation

ABHES

7. Records Management

- a. Perform basic keyboarding skills (i.e. Microsoft Word, etc.)
- b. Utilize Electronic Medical Records (EMR) and Practice Management Systems

8. Administrative Procedures

- e. Maintain inventory equipment and supplies
 - (1) Perform routine maintenance of administrative equipment

► Introduction

The modern medical office requires many different types of administrative equipment in order to function effectively and smoothly. In fact, it is fair to say that a medical office today without a computer, its related software, and other administrative equipment is like a car without gasoline. Your role as a medical assistant includes learning how to evaluate, purchase or lease, operate, and maintain this essential equipment.

Imagine how difficult it would be to function in our current culture's complex office environment without computers for claims submission, patient billing, payroll, bank deposits, and, of course, e-mail. Medical office staff also depend on copiers, scanners, and/or fax machines, adding machines, and paper shredders to accomplish daily tasks efficiently. Going hand-in-hand with this equipment are the administrative supplies like paper and toner, as well as everyday consumable supplies like pens, pencils, highlighters, staples, paper clips, and tape.

In this chapter, you will learn about the use and maintenance of many important pieces of administrative medical office equipment. You also will become proficient in the

process of keeping an inventory of not only the equipment in the medical office but also the basic supplies needed to keep the office running efficiently.

► Computers

LO 8.1

Computer skills are essential for most career choices, and medical assisting is no exception. As a medical assistant, understanding the fundamentals of computers and their uses is a must. This knowledge will enable you to perform many office tasks with ease. The more you know about computers, the more easily you will be able to solve or avoid computer problems. In this section, we will take a closer look at computers and other electronic devices commonly used in the medical office.

Personal computers can be found in homes, offices, and schools. They are ideal for these settings because they are small, self-contained units. Because users have different needs, personal computers are available in several different types. A network is a system that links several (or even 100s) of computers together in which one of the computers commonly acts as server to store shared information such as the office database management system.

Desktop

The most common type of personal computer in the medical office, a desktop model fits easily on a desk or other flat surface. The system unit of many desktop models is housed in a tower case, which can be placed on the floor next to the desk to allow more surface area at the workstation (Figure 8-1).

Laptop and Notebook

A laptop computer is small, about the size of a magazine, and weighs only a few pounds. Laptops operate either on battery power or on an AC adapter. Using laptops and notebook computers, physicians and other healthcare professionals can instantly communicate with the medical office computer, accessing data and information from other locations. With more and more offices utilizing electronic health records, laptops and notebooks are extremely popular in offices because they are mobile and can be moved between exam rooms. Because of this mobility, offices must be very sure to use encryption software for any patient-based information that is accessible via any mobile device, including laptops.

Subnotebook and Tablet PC

Subnotebooks, which have screens measuring 14 inches or less, are smaller than laptops but larger than handheld computers. Subnotebooks are now quickly being replaced by tablet PCs. These are slate-shaped mobile computers equipped with touch screen and/or graphics table technology. This allows users to operate the computer with a stylus, a digital pen, or simply the user's finger, instead of a keyboard or mouse. Again, to protect patient information, passwords and encryption software must be utilized on any "portable" device.

Personal Digital Assistant (PDA)

PDAs are less common in medical offices and other healthcare facilities. Doctors may use them to look up medications and other reference information. They also may enter data that are transferred into a patient's chart.

FIGURE 8-1 The desktop computer is the most common computer type in the medical office.

© Tetra Images/Getty Images RF

Cell Phones and the Internet

Cell phone use is so widespread that imagining your life without one may be near to impossible. The days of having a land-line connection in your home, complete with an actual handset and separate phone for dialing, are almost a thing of the past. Cell phones are now most often used personally and not professionally. However, for research purposes, cell phone capabilities have increased exponentially in the last several years and will continue to expand. Smartphones using Android™ technology or Apple's iPhones allow users to access the Internet and perform multiple applications in addition to simply making phone calls and sending text messages. They truly are "computers held in your hand." Cell phones will be discussed in more detail in the *Telephone Techniques* chapter.

Computers used in a medical setting usually have access to the Internet but are also frequently linked on an intranet. An intranet is a network system that connects local machines. The intranet allows information such as the office database management system to be shared locally. Database management systems contain patient-based information, and patient health information must be protected. Encryption software must be used for any patient-based information that is accessible via any mobile device, including laptops, tablets, and cell phones (Figure 8-2).

FIGURE 8-2 To protect patient health information, cell phones and other mobile devices must use encryption software when this information is accessed.

► Components of the Computer LO 8.2

When most people talk about computer components, they are referring to the computer hardware, or its physical components, which include the monitor, keyboard, and printer. Computer hardware components are responsible for performing each of four main functions: inputting data, processing data, storing data, and outputting data. In order to work, unless the office is set up with wireless capability and wireless devices are purchased, hardware devices must be connected by a cable, such as a USB or serial cable. Let's look at the four main types of computer hardware—input devices, processing devices, storage devices, and output devices—and their respective role in the medical office.

Input Devices

For a computer to handle information like patient records, the data must first be entered, or input. Several types of input devices—keyboards, touch screens, pointing devices, modems, and scanners—may be used to enter data into the computer. After this information is entered, it can be displayed on the monitor, processed, printed, or stored.

Keyboard The keyboard is the most common input device. Most keyboards have several additional key types.

When you use the keyboard, it is important to position your hands properly to avoid injury. Refer to the *Safety and Patient Reception* chapter for more information on how to prevent and cope with carpal tunnel syndrome, a condition resulting from repetitive motion such as using a computer keyboard.

Pointing Device Many software programs require both a keyboard and a pointing device to enter information into the computer. The three common types of pointing devices are the mouse, the touch pad, and the touch screen.

- A *mouse*, the most common pointing device, has two or three buttons on top and sometimes a rolling ball on the bottom. A laser mouse detects movement through a laser and does not have a ball. As you move the mouse across a flat surface or mouse pad, you cause a light-sensing device on the bottom to move. This controls an arrow on the screen that points at the desired button or on-screen object. Then you push one of the buttons on the mouse to access a function, like opening a file.
- A *touch pad* is a form of pointing device common on laptops and notebooks. It is a small, flat device that is highly sensitive to the touch. To move the on-screen arrow, you simply slide your finger across the touch pad. To click on an item, you tap your finger on the touch pad.
- A *touch screen* is a monitor screen that is illuminated at the touch of a pen, wand, or finger. When an object is touched on the screen, the touch itself acts as a pointing device and conveys information to the computer. Touch screens are increasingly being used in clinical and hospital settings, as they are now commonly found with notebooks, iPads, and smart phones.

Modem A modem is used to transfer information from one computer to another over telephone lines. Because modems

allow information to be transferred both to and from a computer, they are considered input/output devices. Modems are essential for any medical office that needs to transfer files electronically, as when submitting insurance claim forms. Modems can be internal, external, or wireless. The three standard types of modems are cable modems, digital subscriber line modems, and fax modems.

- A cable modem is a modem that operates over cable television lines to provide fast Internet access.
- **Digital subscriber line (DSL)** modems operate over telephone lines but use a different frequency than a telephone frequency. This type of modem allows computer Internet access and telephone use at the same time.
- A fax modem allows the computer to send and receive files much as a fax machine does. A fax modem is not quite as versatile as a regular fax machine, as the information being sent must first be input into the computer. In addition, without the use of a scanner, you cannot use a fax modem to send a patient record with handwritten notes on it.

Scanner A scanner is a device used to input printed matter and convert it into a readable format for the computer. Scanners are useful in the medical office because patient reports (from another doctor, hospital, or outside source) can be easily entered into the computer and, often, directly into the patient medical record. This makes it possible to move into a paperless medical system. Using a scanner is much faster than keying, or inputting the information with a keyboard. Three types of scanners are available:

- Handheld scanners are generally the least expensive but are more difficult to use and produce lower-quality results than the other two types.
- A single-sheet scanner feeds one sheet of paper through at a time and looks similar to a single-sheet printer.
- A flatbed scanner is the easiest to use and produces the highest-quality input. It works much like a small photocopier: The paper lies flat and still on a glass surface while the machine scans it. Today, most photocopiers are configured with a scanning capability and can transmit the images of scanned documents directly into computers.

Processing Devices

There are two major processing components inside the system unit, or computer cabinet: the motherboard and the central processing unit. The *motherboard* is the main circuit board that controls the other components in the system. The **central processing unit (CPU)**, or microprocessor, is the primary computer chip responsible for interpreting and executing programs. The CPU is considered the most important piece of hardware in a computer system because it interprets instructions from software programs. Without a functioning CPU, the software programs will not run. Processing devices for cell phones and other mobile devices are very small electronic “chips” found inside the device.

Storage Devices

One of the computer's main tasks is to store information for later retrieval. The computer uses memory to store information either temporarily or permanently. Several types of drives are used for permanent information storage.

Memory Computers use two types of memory to store data: **random-access memory (RAM)** and **read-only memory (ROM)**. RAM is temporary, or programmable, memory. While you are working on a software program, such as Microsoft® Word, the computer is accessing RAM. In general, the more RAM that is available, the faster the computer will perform. As software programs become more sophisticated, they require more RAM.

ROM is permanent memory. The computer can read it, but you cannot make changes to it. An example of ROM is Windows® 10, a computer operating system. The purpose of ROM is to provide the basic operating instructions the computer needs to function.

Hard Disk Drive The hard disk drive is where information is stored permanently for later retrieval. Software programs and important data are usually stored on the hard disk for quick and easy access. The amount of hard disk space needed to store software programs is increasing rapidly. The more software programs you want to store, the larger the hard disk you will need.

Removable Drives Removable drives consist of CDs, jump drives, tape drives, zip drives, and DVDs.

- **CD-ROM drive.** The term *CD-ROM* stands for “compact-disc—read-only memory.” CD-ROMs look like audio compact discs, but they contain software programs that often include video, sound, and other media, such as graphics, to convey information. CD-ROMs also can be used to back up information from the hard drive.
- **CD burner or recorder.** Most computers also have a CD recorder (CD-R), which allows information to be taken from one CD (or any other source) and copied to another CD.
- **External hard drive.** It is not uncommon in larger offices to use a separate computer hard drive as a backup, or to hire a company to back up the files nightly or weekly via the Internet, and store them in a separate facility.
- **Jump drive.** A jump drive—also called a flash drive, pen drive, key drive, memory key, flash key, or USB drive—is an externally attached drive that is small enough to be carried on a key chain yet holds 16 gigabytes or more of data. It provides easy portability for large bodies of data, and may be used for backup operations in a medical practice when stored off-premises. To protect any proprietary information stored on a removable drive such as a CD, DVD, or jump drive, the information should be encrypted in case the storage device is lost or stolen. Jump drives attach to the CPU via the USB ports found on the front, back, or side of the CPU device (see Figure 8-3).

FIGURE 8-3 Plugging a jump drive into the USB port of a CPU.

© JGI/Jamie Grill/Blend Images LLC RF

- **Zip drive.** A zip drive is a high-capacity floppy disk drive developed by Iomega™. Zip disks can hold up to 750 MB of data. Zip drives are durable, are relatively inexpensive, and may be used for backing up hard disks and transporting large files.
- **DVD.** DVD (digital video disc) is optical disc storage technology. It is similar to CD technology except it is faster and can hold more information. One double-sided, dual-layer disk can store about 8 hours of high-quality video.

Output Devices

Output devices are used to display information after it has been processed. A monitor and a printer are two output devices needed in the medical office.

Monitor The monitor displays currently active information, such as a word processing document, an Internet link, or e-mail. Most healthcare facilities use LCD (liquid crystal display) monitors, which provide for better privacy than older, bulkier models because they cannot be seen from the side.

Resolution refers to the crispness of the images and is measured in dot pitch. The lower the dot pitch, the higher the resolution. For example, a monitor with a 0.26 dot pitch displays sharper images than a monitor with a 0.39 dot pitch. Using a high-resolution monitor can help you avoid eye strain.

Printer A printer produces a *hard copy*—a readable paper copy or printout of information. You will need a printer to print out correspondence, patient reports, bills, insurance claims, and other documents. Printer resolution is noted in terms of dots per inch (dpi). The higher the dpi, the better the print quality. Printer output varies, depending on the printer type and model. The two most commonly used printers are laser and ink-jet.

- **Laser printers** are high-resolution printers that use a technology similar to that of photocopiers. They are the fastest type of printers, produce the highest-quality output, and

are now the most common type of office printer. Their cost has decreased as technology has improved.

- Ink-jet printers are nonimpact printers that form characters using a series of dots created by tiny drops of ink. Many ink-jet printers are capable of printing in both black ink and color. Because of their high-quality output and affordable prices, ink-jet printers are popular for small-office use.

Most offices have found it more economical to purchase or lease “all-in-one” devices. These function not only as the office printer but also as a fax machine, scanner, and photocopier (see Figure 8-4).

► Software

LO 8.3

The program, or set of instructions that tells the computer what to do, is known as its **software**. Computer software is generally divided into two categories: operating system and application software. The operating system controls the computer’s operation. Application software allows you to perform specific tasks, such as scheduling appointments.

Operating System

When you turn on a computer, the operating system starts working, providing instructions that the computer needs to function. Examples of operating system software include Microsoft® Windows® 10 and Linux. Most computers come pre-installed with Windows® 7, 8, or 10.

Operating system software is sometimes referred to as the platform for the system. Most medical practices use IBM-compatible personal computers, which are very suitable for businesses that use computers primarily to manipulate words. On the other hand, advertising agencies or design firms, which are extensively involved in graphics, visual images, or desktop publishing, tend to use Apple® (Macintosh—MAC) computers.

Windows This operating system uses a graphical user interface, or GUI (pronounced “gooey”), which uses **icons**, or graphic symbols (Figure 8-5) to represent the job to be done. In this example, the “print” command is identified by a tiny illustration of a printer. When the icon is clicked, the chosen document will be printed. Most of you have been using a

GUI interface for most of your lives, using your parents’ cell phones or a child’s computer learning system, such as those from LeapFrog®, to play (educational) games before you even knew what else a computer could be used for.

Another important benefit of the Windows® system is that it is capable of multitasking. This means it can run two or more software programs simultaneously. For example, you might have one screen open to enter information in the patient **database** (a collection of records created and stored in the computer) at the same time as you have a word processing program open while you complete a letter for a patient who needs a letter from his primary care physician stating that he is medically cleared to return to work.

FIGURE 8-4 An all-in-one printer-scanner-fax machine can be networked to multiple computers in the office.

© Getty Images RF

FIGURE 8-5 MS Word 2007 formatting toolbar with GUI icons, pointing out the Printer icon.

Applications

Most of the software sold in stores is application software like Microsoft® Office. Microsoft® Office includes word processing (Word), presentation software (PowerPoint), spreadsheets (Excel), database management (Access), and desktop publishing (Publisher). Medical Manager®, Medware®, Medasis, and MediSoft™ are practice management applications. These software packages are specifically designed to meet the needs of a medical practice. Standard computer practice management software packages can be purchased, and custom-made practice management software can be designed to meet the needs of a particular practice. Word processing, database, and accounting software are just a few examples of the wide variety of applications available.

Optical Character Recognition Optical character recognition (OCR) software enables the conversion of images to text so they can be treated like any other type of word processing document. An OCR system includes an optical scanner for reading text and state-of-the-art software for analyzing images. An OCR system enables an article or a patient file to be fed into an optical scanner, where it is transferred into an electronic computer file. It is then possible to manipulate and edit the file using a word processor.

Using Application Software

Computer software has been developed for nearly every office function imaginable. Using software, you can complete tasks with greater speed, accuracy, and ease than with a manual system. Learning how to use the software correctly, however, is the key to getting the most out of your computer system.

Word Processing In the medical office, as in any office, word processing is a common computer application. It has replaced the typewriter for writing correspondence and reports, transcribing physician notes, and performing many other functions. With word processing, a form letter can be merged with a patient mailing list to create letters that are personalized with patients' names without having to retype each letter.

Database Management A database is a collection of records created and stored on a computer. In a medical office, databases are used to store patient records such as billing information, medical chart data, and insurance company facts. These records can be sorted and retrieved in many ways and for a variety of purposes. You may be asked to find, add to, or modify information in a database. For example, you might use a database to determine all the patients covered by a particular insurance company. Microsoft Access® is a common database management software program.

Accounting and Billing Accounting and billing software is extremely useful in an office environment. It enables you to perform many tasks, including keeping track of patients' accounts, creating billing statements, preparing financial reports, and maintaining tax records. (You will learn more about billing and accounting functions in the *Insurance and Billing* and *Patient Collections and Financial Management* chapters.)

Appointment Scheduling Instead of writing in an appointment book, most offices use software to schedule appointments. Some scheduling packages allow you to enter patient preferences, like day of the week and time, and then to list available appointments based on that information. If the office system is on a network, scheduling software is particularly valuable because more than one user can access the appointment schedule at a time (Figure 8-6).

Electronic Transactions Many medical offices are now computerized and perform many transactions, such as insurance claim form submission and insurance payment posting, electronically. Procedures such as these, which formerly took minutes or hours, are now performed almost instantaneously. Instead of waiting for checks to come in the mail, credit card payments are accepted in the office and online. Insurance payments are deposited automatically into the office checking account. Instead of waiting for days for requested medical records, the office can receive them in seconds when sent securely using encrypted e-mail systems. We discuss many electronic procedures in greater detail in other chapters.

Communicating The ability to communicate and share information with other computer users and systems is important in many medical offices. This communication may take place through e-mail, online services, and the Internet.

- **E-mail.** E-mail allows for the sending and receiving of messages almost instantly through a network. Through e-mail, it is possible to communicate with computer users in your own office, across town, or on the other side of the world. The use of e-mail in a professional context, including appropriate formats and confidentiality, is discussed in more detail in the *Written and Electronic Communication* chapter. Just a reminder, the office e-mail system is for professional use only. It is not private. Anything you send through the office e-mail system may be accessed by your supervisor and/or the office IT department. Keep office e-mail communications professional at all times.
- **Online services.** These services, known as "listserve," provide a means for healthcare professionals to communicate with one another. Most online services contain forums that offer information and discussion groups focusing on a wide range of medical topics. Healthcare workers can learn about the latest medical research and technology or exchange ideas with others in their field. In addition, some online services provide access to medical databases like MEDLINE®, created by the National Library of Medicine. Users can search MEDLINE® for records and abstracts from thousands of medical journals around the world.
- **Internet.** The Internet is a global network of computers. E-health or medical information and products are easy to access worldwide via the Internet. Many large medical facilities, universities, and other organizations—such as the National Institutes of Health (NIH) and the Centers for Disease Control and Prevention (CDC)—provide medical resources, databases, and other information on the Internet. Table 8-1 describes a few popular credible medical resources available on the Internet.

TABLE 8-1 Medical Resources on the Internet		
Organization	Web Address	Description
American Medical Association	http://www.ama-assn.org	News announcements and press releases; articles from <i>JAMA</i> and other AMA journals; links to other medicine-related Internet sites
eMedicineHealth	http://www.emedicinehealth.com	Health resource center containing information about health issues and the latest treatments available
Health.gov	http://health.gov/	The Office of Disease Prevention and Health Promotion develops and coordinates high impact national disease prevention and health promotion activities, creating a healthier nation
MedlinePlus®	http://medlineplus.gov	A service of the US National Library of Medicine and NIH; site includes current health news, a medical encyclopedia, and directories for doctors, dentists, and hospitals
National Institutes of Health	http://www.nih.gov	Medical news and current events; press releases; biomedical information about health issues; scientific resources; links to Internet sites of related government agencies
National Library of Medicine	http://www.nlm.nih.gov	Internet site for world's largest biomedical library; research and developmental activities; connections to online medical information services
<i>New England Journal of Medicine</i>	http://content.nejm.org	Articles and abstracts; archives of past issues
WebMD Health®	http://www.webmd.com	Trustworthy, credible, and timely health information written by experts in medicine, journalism, and health communications

The Internet has also become a profitable marketing tool for medical practices. Medical websites can generate more new patients than paper advertising. Within the website,

doctors can include patient education, newsletters, referring provider forms, and other patient-related information. Additionally, patients can e-mail the medical office personnel to

ask questions and find out other pertinent non-PHI (protected health information).

► **Software Training** LO 8.4

Software programs may seem quite complex, especially at first. Most people need a period of training before they feel comfortable using the application. Several methods of training—some from outside sources and some provided by the software manufacturer—are available.

Classes

Many computer vendors offer training classes for the software packages they sell. In addition, community colleges and high schools sometimes offer adult education classes for a variety of applications, including word processing and communications. These classes may be at the beginner, intermediate, or advanced level.

Tutorials

Several software packages come with a *tutorial*, which is a small program designed to give users an overall picture of the product and its functions. The tutorial usually provides a step-by-step walk-through and exercises that allow you to try out your newly acquired knowledge. (See Figure 8-7.)

Documentation

Nearly all software manufacturers provide some type of documentation with their programs. Documentation is usually in

the form of written instruction manuals or online help that is accessed from within the program.

Technical Support

A software company’s technical support service is designed to assist you with problems that go beyond the scope of the user’s guide or manual. A call to technical support is important when you encounter a problem that cannot be solved by simple problem-solving techniques. By calling a toll-free number, you can access a knowledgeable team who will listen to the description of the problem and suggest solutions over the phone.

Before calling technical support,

- Check the system for errors to the best of your ability.
- Check your manual for answers. Ask your supervisor for assistance.
- Have the software registration number available.
- Be prepared to follow the technical support personnel’s instructions.
- Allow uninterrupted time to spend on the phone with the technical support person.
- Plan to call from a location that gives ready access to the problem computer.

Technical support is also helpful when you are upgrading software and can be a good source of information regarding the latest products and their applications. Some software companies automatically notify their customers of available upgrades.

FIGURE 8-7 Practice Fusion® provides tutorials, on-demand recorded webinars, and other forms of training to help new users learn and become proficient with their system.

► Selecting Computer Equipment LO 8.5

Most medical offices are computerized, so if the decision is made to upgrade the system, you may be a part of the decision-making process in selecting equipment. As a medical assistant who will be using the system, you may be asked for your input in selecting software, adding a network, or choosing a vendor.

The first step for helping in the selection process is to learn as much as you can about hardware and software. You can get information by taking an introductory computer class at an adult school or community college; by reading computer magazines or books; or by talking to friends, relatives, or coworkers who use computers.

Upgrading the Office System

Computer hardware is changing and improving at such a rapid pace that a system seems to become outdated almost as soon as it is purchased. In addition, more advanced software is introduced every day, and this software requires more advanced hardware in order to run, so an office system purchased only a year or two ago may need to be upgraded. Sometimes an upgrade simply requires replacement or addition of certain components. For instance, a laser printer can take the place of an ink-jet printer or portable computer devices may be added to allow healthcare providers to add information directly into the patient's medical record during the time of the visit. In other cases, such a solution is not possible or cost-effective, so an entirely new system must be purchased.

Selecting Software

Once the decision is made that a new software program, such as accounting software, is needed, research will have to be done to choose the specific software program to be purchased. To make an informed decision, you can read software reviews in computer magazines or trade publications. Check with other medical offices to get opinions on software packages. A crucial step in selecting software is to make sure the office computer system meets the minimum system requirements listed on the software box.

Adding a Network

A computer network enables users to share software programs and files and allows more than one person to work on the same patient's information at one time. While you are working on a patient's insurance claim, for example, another medical assistant might be inputting billing information. Some medical offices are virtually paperless, using a highly sophisticated network with a notebook or desktop computer in every examination room. Authorized personnel input information directly into patients' computerized records. If a doctor is in her office and a patient is waiting, a staff member at the front desk sends an e-mail message to the doctor's desktop computer (or cell phone) and a beep sounds as an alert. Networks also allow large medical facilities to communicate with employees via e-mail. For instance, an internal memo about changes in office policies may be sent by e-mail to all employees. For networks to operate, the computer must have either a network interface card or a

wireless connection to the network. Networks can be run with Windows®, Novell®, or Unix® network operating systems.

Virtual Private Networks

When a group of two or more computer systems are linked together, it is known as a network system. The computers in a **local-area network (LAN)** are geographically close together (for example, in the same building). The computers in a **wide-area network (WAN)** are farther apart and are connected by telephone lines. **Virtual private networks (VPNs)** are used to connect two or more computer systems. They are also constructed using public telephone lines and use the Internet as the medium for transporting data. VPNs use encryption and other security methods to ensure that only authorized users can access the network. This type of network makes it possible for physicians to access patient records in a secure manner from a variety of locations.

Choosing a Vendor

When purchasing computer equipment, you should look for a reputable vendor who not only offers a reasonable price but also provides training, service, and technical support. A first step might be to check with personnel in other medical offices that use a computer system. Find out which dealer they use and if they are satisfied with the system, salespeople, and support. You also can ask dealers for references from medical offices that have purchased systems from them. It is a good idea to get cost estimates from at least three vendors, and it is preferable to buy all hardware components from the same vendor.

Technology Advances

Computers are evolving at such a rapid pace that it is virtually impossible to predict the changes that will take place even in the next few years. Some important new technologies, however, have already been introduced in the medical office and will be improved in the near future. Telemedicine and speech recognition technology are only two examples of new computer technologies. Undoubtedly, more will be explored and developed every year.

Telemedicine *Telemedicine* refers to the use of telecommunications to transmit video images of patient information, such as CT scans or even teleconferences involving multiple care providers. These images are already used to provide medical support to physicians caring for patients in rural areas. The use of telemedicine and advancements in computer technology allow medical practices to quickly access vast amounts of current medical information.

Speech Recognition Technology Speech recognition technology enables the computer to comprehend and interpret spoken words through the use of a specialty software program. The user simply speaks into a microphone instead of inputting information with a keyboard or a scanner. Because every human voice is different, and the English language is vast and complex, this technology is, however, difficult to perfect. As speech recognition technology becomes more advanced, more accurate, and less expensive, it will likely gain widespread acceptance. It has a great deal of potential, including the ability to virtually eliminate the need for medical assistants to

transcribe physicians' notes. There are a variety of speech recognition software applications available for use.

► Computer System Care and Maintenance

LO 8.6

Like a car, a computer needs routine care and maintenance to stay in sound condition; the computer user's manual outlines the steps required. Also, a good general rule is not to eat or drink near the computer. Crumbs and spilled liquids can damage the system components and storage devices.

Care for the System Unit

The system unit should be placed in a well-ventilated location, with nothing blocking the fan in the back of the cabinet. To keep the system's delicate circuitry from being damaged by an electrical power surge, you should use a power strip with a surge protector. You plug the computer into the power strip and then plug the power strip into the electrical outlet. If a power surge should occur, the surge protector will absorb the power, not the computer system. Surge protectors can also be purchased with an attached battery backup that will protect the computer during a power outage. Basic care for the system components is outlined as follows:

- **Monitor.** A screen saver automatically changes the monitor display at short intervals or constantly shows moving images on the computer monitor or screen. All Windows® operating systems come equipped with screen savers. To protect their screens, many monitors "power down" after a certain period of inactivity. If no one uses the computer for 30 minutes, for example, the monitor screen goes blank. To resume using the computer after the screen saver has been activated or the monitor has powered down, you may need to simply touch any key or move the mouse. However, if the medical office has activated the "On resume, display logon screen" feature that is standard on Windows machines you may be required to enter your login information again. Also, adding a screen cover to a monitor when it is not in use will protect the monitor.
- **Printer.** Printer maintenance generally consists of replacing the ink cartridge or toner cartridge when required. When the cartridge needs to be changed, the ink on your printouts becomes very light and colors become faded. Some integrated computer and printer systems automatically provide a "Low Ink" message on the screen when printer cartridges need replacing. The message appears when the "Print" command is given. A graph indicates the amount of ink left in the cartridge. Ink can be ordered online through a link provided with the printer program. Replacement is usually a simple process, described in the printer manual.
- **Storage devices.** Jump drives and CD-ROMs are highly sensitive devices. Even a small "injury" may cause permanent damage or make it impossible to retrieve data. To avoid problems, handle and store these devices properly. A jump drive should be protected when it is not attached to the computer. Always put the cap back on when it is not attached to

the CPU or when you are transporting the drive to another location. When you handle a CD-ROM disc or pick it up, touch only the edges or the edge and the hole in the center; always be careful not to touch the flat surface of the disc. CD-ROMs should be stored in the clear plastic case (sometimes called a jewel case) in which they are packaged.

► Security in the Computerized Office

LO 8.7

Although security measures are important in any office, they are especially important in a computerized medical office. Great care must be taken to safeguard confidential files, make backup copies on a regular basis, and prevent system contamination. HIPAA and HITECH laws require that privacy and security procedures be in place to prevent the misuse of health information. These procedures also must ensure confidentiality.

Safeguarding Confidential Files

Much of the information collected in a medical office is confidential. Just as with paper records, confidential information stored on the computer should be accessible only to authorized personnel. Always take care that computer screens are not visible to patients or other unauthorized personnel, and use screen savers when not use. Log off or lock your computer when leaving your desk to minimize risk of unauthorized access in your absence. Three common ways to provide security in a computerized office are to employ passwords, to encrypt sensitive information when it is being transferred electronically or stored on a "removable" storage device, and to install an activity-monitoring system.

Passwords In many hospitals and physician offices, each employee who is allowed access to computerized patient files receives a password. The employee must enter the password into the computer when using the files. Access codes or passwords only allow the user into approved areas according to the individual's job description. When you receive a password, do not divulge it to anyone else. If an employee leaves or is terminated, the user account should be deleted. When you choose a password, do not use common ones such as your birthday. This is so important that many times specific guidelines for creating a password must be followed and commonly used formats, like birthdates, will not be accepted by the password program. It is also becoming a common requirement that passwords be changed every 60–90 days and cannot repeat previous (6) passwords. Passwords should contain a variety of numbers, symbols (if accepted), and both upper- and lowercase letters.

Encryption Software Encryption software allows personal information or other PHI to be encoded in such a way that only the person with the key (password) is able to open the document in its "decoded" format.

Activity-Monitoring System In conjunction with passwords, most healthcare facilities use a computer system that monitors user activity. Whenever someone accesses computer

records or an Internet site, the system automatically keeps track of the user's name and the files (or sites) that have been viewed or modified. In this way, if necessary, problems or security breaches can be traced back to specific employees.

Preventing System Contamination

Computer viruses constitute another important security issue in the computerized medical office. Viruses are programs written specifically to contaminate the hard disk by damaging or destroying data. They can be passed from computer to computer through shared, infected diskettes. Computer viruses also can be spread through infected files retrieved from online services, the Internet, e-mails, and electronic bulletin boards. Several software programs are available to detect and correct computer viruses. Most are fairly inexpensive but provide an invaluable service.

Antivirus Software and Firewalls There are literally hundreds of security vulnerabilities awaiting your computer system. You need to be concerned about everything on your computer from the operating system to the software applications. Antivirus software provides protection for your computer. It scans your system for viruses automatically and manually. If it finds a virus, it either destroys it automatically or alerts the user to respond by “cleaning” the file, thus destroying it. Antivirus software responds to spammers (persons who abuse e-mails by sending them in mass without permission), who often send malicious e-mails and files. If you do not know who sent you an e-mail, it is best not to open the file.

Firewalls (barriers to keep destructive forces away from your computer) also are called security protection. Firewalls are helpful in putting a stop to offensive Internet sites and potential computer hackers (a person who can get inside a computer legally or illegally and do anything) who are trying to gain access to your computer.

Computer Disaster Recovery Plan

When any business is dependent on computer technology for daily functioning, a computer disaster recovery plan for the business must be in place. A recovery plan offers a possible solution if the primary computer system should fail, or “crash,” making all information on the hard drive unavailable. Disaster recovery planning can be developed within an organization, or it can be purchased as a software application or a service.

In a medical practice, it is important to discuss the computer disaster recovery plan with the staff so that everyone knows the part he or she will play if the computer system fails. As devices, systems, and networks become more complex, there are simply more things that can go wrong. As a result, these plans have become increasingly important and sophisticated.

Although a computer disaster recovery plan will vary from practice to practice, all plans should include these elements:

- *Minimizing damage to equipment.* Automatic warnings are built into computer systems to indicate when a fatal error has occurred. Warnings also provide direction to help prevent information loss and minimize damage to the computer equipment.

- *Retrieving information.* As stated earlier in the chapter, it is essential to routinely back up the office files using either an automated or manual backup system. An example of an automated system is a second computer, networked to the first, to which information is regularly backed up in the event the primary computer system fails. With this type of backup, the operation of the office can continue while the primary system is repaired or replaced. An example of a manual electronic backup system is copying files to CDs and keeping these backups off site. An example of a paper backup system, which is less useful, is a handwritten list of patients and the procedures performed each day.

How often backups are made varies among medical offices; your supervisor will tell you the policy for your office. If the office staff is responsible for performing the backup, remember that storing the backups properly is just as important as making them. Backup files should not be stored near the original files. Ideally, they should be kept outside the medical office—perhaps at a storage site or lock box—for security in case of fire, burglary, or other office catastrophe. Backup systems are also vital. If the main system fails, the backup system will allow all the information to be retrieved and not permanently lost.

- *Guarding protected health information.* Even during an office emergency, like a computer failure, healthcare professionals are still required to carefully protect the privacy of patient records. If an electronic or manual backup system is implemented, safeguards to protect patient information must still be observed.

► Administrative Medical Office Equipment

LO 8.8

Using automated equipment enables you to perform a task more easily and quickly than doing it manually. For example, adding numbers on a calculator is a much faster process than doing it on paper. Many of the administrative tasks in a medical practice can be accomplished with the help of automated equipment, allowing you more time to perform other tasks.

Facsimile Machines

Although computerized offices most often use scanners and e-mail for critical communications, alternate methods must be used when e-mail is not accepted by the recipient of the information. A facsimile (fax) machine can be an efficient way to accomplish this. A fax machine scans each page of a document, translates it into electronic impulses, and transmits those impulses over the telephone line. When another fax machine receives the impulses, they are converted into an exact copy of the original document.

A fax machine in a medical office should have its own telephone line. A separate line ensures that transmission of incoming and outgoing faxes will not be interrupted and that the machine will not tie up a needed telephone line when sending or receiving information. Always keep in mind that faxed material may include protected health information.

For this reason, fax machines should never be placed in patient examination rooms or reception areas where unauthorized persons may be able to view incoming or outgoing documents. Only staff members with a “need to know” should have access to faxed and other confidential information. Because of the confidential nature of many faxes, all faxes should also be sent with a fax cover sheet that contains a **disclaimer**. This disclaimer should state that the material within the fax is intended only for the person to whom it is being sent and if the fax is received in error, to inform the sender and destroy the fax immediately (see Figure 8-8).

Benefits of Faxing A fax machine can send an exact copy of a document to a recipient within minutes. The cost for sending a fax is the same as for making a telephone call to that location. In addition, many fax machines have a copier function and can be used as an extra copy machine. The telephone for the fax also may be used as an extra extension for outgoing calls, if needed. Procedure 8-1, found at the end of the chapter, details the correct steps for using a fax machine.

Receiving a Fax Faxes can be received 24 hours a day if the fax machine is turned on and has an adequate paper supply

FIGURE 8-9 Typical office facsimile (fax) machine.
© Comstock Images/Alamy RF

(Figure 8-9). Today's fax machines have memories and can store and receive documents. If the fax machine is not already sending or receiving a fax, the fax telephone rings, or the machine buzzes briefly, signaling the start of a transmission. The transmission begins shortly thereafter, with the machine printing out the document as it is sent. When the document is completed, the machine may print a transmission report that includes the number of pages, the date and time, and the originating fax number.

Typewriters

Although typewriters are used very little in a medical practice, they may still be used to complete medical forms brought in by patients or sent from an insurance company if the office does not use electronic billing software. These forms can be completed more clearly when the information is typed instead of handwritten.

Most modern medical practices have eliminated typewriters altogether and, instead, use computers with word processing software and scanners to create and manipulate word documents.

Photocopiers

A photocopier, also called a copier or copy machine, instantly reproduces office correspondence, forms, bills, patient records, and other documents. A photocopier works by taking a picture of the document it is to reproduce and printing it on plain paper using a heat process. Photocopiers use either liquid or dry toner (a form of ink). Various kinds of paper can be used in the machine, including office stationery and colored paper. Many photocopiers accept different sizes of paper, from the standard 8 × 11 inch paper to 8 × 14 inch legal paper and even larger.

Photocopiers come in many models with varying features and speeds—from desktop machines for limited use to industrial

FIGURE 8-10 The office copier produces hard copies of documents.
© Total Care Programming, Inc.

models for continual heavy use. All styles are available through purchase or lease. Procedure 8-2, found at the end of the chapter, describes the correct method for using a photocopier machine.

Special Features In addition to the copier/scanner/fax combination machines, most copiers offer a wide range of special features. They may collate (assemble sets of multiple pages in order) and staple pages, punch holes, enlarge or reduce images, and produce double-sided copies (print on both sides of the page). Some also can adjust contrast and even track the cost of a job via a specific code input into the machine. Some photocopiers produce black-and-white copies as well as color copies. Some copiers can make transparencies (text and images printed on clear acetate), which physicians often use for presentations. Many copiers can also be networked to computers and act as both printers and copiers (see Figure 8-10).

One of the more useful features of photocopiers is the “Help” function. Selecting this function displays directions in plain English that explain how to fix a paper jam or deal with other routine copier problems. Some copiers are even programmed to indicate that service is needed.

Adding Machines and Calculators

For handling tasks such as patient billing, bank deposits, and payroll, many medical practices depend on adding machines and calculators. The difference between the two types of machines is minimal. Adding machines typically plug into an outlet and produce a paper tape on which calculations are printed. Calculators are more often battery or solar powered, with memory to store figures. Calculators are portable and usually do not produce a paper tape.

Routine Calculations Both adding machines and calculators are sufficient for most routine office calculations, such as basic arithmetic functions like addition, subtraction, multiplication, and division. More contemporary models perform such specialized functions as computing percentages and storing data. Some are even computerized.

Do remember that it is easy to hit an incorrect key or to key in a number twice when using an adding machine or a calculator. Always double-check all mathematical computations. If the machine produces a paper tape, check the numbers on the tape against the numbers you are adding. The paper tape is especially useful when adding a long series of numbers. Without a printed record, you must perform the same calculations again to make sure the total is correct.

Folding and Inserting Machines

Letter-folding equipment can help minimize the amount of time staff spends preparing large volumes of outgoing mail. Letter folders are also used for creating folded brochures. A medical practice may use folding and inserting machines for a variety of items, including invoices, newsletters, checks, statements, letters, and flyers.

Lower-end folding equipment requires letters to be fed manually. The speed of this machine is limited to the speed an individual can feed in letters, which is typically about 200 pieces per hour. An automatic feeder is required for faster folding. You will learn more about fold types and folding machines in the *Written and Electronic Communication* chapter.

Postage Meters

Every medical office uses the US Postal Service. Patient bills, routine correspondence, purchase orders, and payments are just some of the items typically sent by mail. The *Medical Records and Documentation* chapter will also provide additional information on mailing correspondence.

Although some medical offices use stamps, most use a postage meter. A postage meter is a machine that applies postage to an envelope or package, eliminating the need for postage stamps (Figure 8-11). A postage meter often has two parts: the meter, which belongs to the post office, and the mailing machine, which the practice can own. The meter actually applies the postage and the mailing machine (if available) seals the envelope.

Benefits of Using a Postage Meter Using a postage meter instead of purchasing stamps saves frequent trips to the post office. It also saves money for the office by providing the exact amount of postage needed for each item, instead of using a combination

of stamps, which can cause you to exceed the minimum required postage. Some postage meters can even imprint envelopes with the name of your medical practice or with a message at the same time postage is applied. The message appears immediately to the left of the postal mark, at the top of the envelope.

There are many types of postage meters available, from basic models for a small office to advanced models for large businesses. The latest machines include automatic date setting, memory to program a large mailing, and display alerts for low postage or the need for ribbon replacement. Some models can apply postage to parcels without the use of labels or tape. Procedure 8-3, at the end of this chapter, describes how to use a postage meter.

Prepaying for Postage To use a postage meter, you must prepay the postage. You can take your meter to the post office to add postage, use a postage meter service, or order postage online. A service maintains the postal account for you. Although the money in each account is the property of the US Postal Service, the provider manages the account and adds postage to the meter, as long as money is in your account with the service. Keeping the postage account current ensures that postage is always available and all mail is sent on a timely basis. This task may be one of your responsibilities. On any meter, you can check the amount of postage used and the amount remaining with the touch of a button. On some models, the meter must have \$10 or more for the machine to apply postage to an envelope or package.

Postal Scales

Besides the postage meter, a medical practice also needs a postal scale. Postal scales are a good investment because they show both the weight and the amount of postage required. Some postage meters include an electronic scale. If you need a postal scale but one is not available, you can use any scale that weighs in ounces. When using a simple scale, you can then translate the weight into the correct postage by using a current postal rate chart, available from the US Postal Service, which cuts down on mail being returned for inadequate postage.

Dictation-Transcription Equipment

Healthcare professionals are seldom known for their beautiful handwriting. For offices that do not have electronic medical records, handwritten notes can be difficult, if not impossible, to read. Medical assistants, although not professional medical transcriptionists, may be asked to transcribe recorded words into written text. Using dictation-transcription equipment is the most efficient way to complete this task. *Dictation* is another word for speaking; *transcription* is another word for writing. Together, they mean to transform spoken words into written form. Should transcription be included in your job description, you will need training on using this specialized office equipment.

Check Writers

Medical practice personnel need to write checks to pay for equipment, supplies, and payroll. This common office procedure can be automated by using a check writer, which is a machine that imprints checks. Procedure 8-4, located at the end of this chapter, details the correct steps for operating a check-writing machine.

FIGURE 8-11 The postage meter is a convenient and cost-efficient way to apply postage to correspondence and packages.

© McGraw-Hill Education. Mark Dierker, photographer

The safety advantage of using such a machine is that the name of the payee (the person receiving the check) and the amount of the check, once imprinted, cannot be altered. Numerous check-writing software packages can assist you, including QuickBooks, Checksoft, and VersaCheck.

Paper Shredders

Paper shredders cut documents into tiny pieces to make them unreadable. They are quite common in medical practices, as they allow protection of protected health information that is no longer required by the office. A paper shredder, like the one shown in Figure 8-12, is often used when confidential documents, such as patient records, need to be destroyed. The most common type of shredder cuts paper into ribbonlike strips, which differ in width, depending on the model. Other shredders cut the paper in two directions, forming small pieces. Some paper shredders offer additional options, such as an electronic eye that automatically starts the machine when paper is inserted and stops when it is done. Other features available are paper jam detection, automatic reverse, and automatic shutdown when the machine gets too hot.

How to Shred Materials A paper shredder is ready to use when it is turned on. To shred a document, insert it into the feed tray at the top of the shredder. The machine feeds the

paper through hundreds of knifelike cutters, instantaneously shredding the paper. A basket attached beneath the shredder catches the bits of paper. Different models can accommodate different amounts of paper through the cutters. Shredder baskets must be emptied periodically to allow room for additional shredded paper. Some shredders even signal when the basket

FIGURE 8-12 Using a paper shredder protects patient PHI when it is no longer needed.

POINTS ON PRACTICE

Recycling in the Medical Office, Hospital, Laboratory, or Clinic

You may easily incorporate recycling procedures into the daily routine of a medical office, hospital, laboratory, or clinic. Recycling may be required by state law. Some states levy large fines for noncompliance with recycling regulations. Purchase paper products that can be recycled, or those made of postconsumer recycled materials, and take care in disposing of them. Care should be taken to ensure HIPAA compliance when recycling paper. Shredding is the most effective way to comply with HIPAA regulations.

There are two essential aspects of recycling: disposal and purchasing. To create a complete recycling program, ensure that materials are disposed of properly and that purchased products have been made from recycled materials. Your town's recycling center provides guidelines for packaging recycled materials and for a pickup schedule as well as containers for recyclable materials and a list of paper materials that can and cannot be recycled. Follow regulations from OSHA and your office policy for disposal of biohazardous materials and other medical wastes. As discussed in the *Infection Control Fundamentals* chapter, these are disposed of in designed protective containers.

When purchasing items for recycling, look for the universal recycling symbol, which has three chasing arrows (Figure 8-13).

This symbol could mean that the product or package is made up of recycled materials or that the product or package is recyclable. Unless the package is made of 100% recycled materials, the law requires the package to display how much. Watch out

for claims that do not mean anything. Claims that a product or service is “environmentally friendly,” “environmentally safe,” “environmentally preferable,” or “eco-safe” or labels that contain environmental seals are unhelpful. These phrases alone do not provide the specific information you need to compare products, packaging, or services on their environmental merits. If you want to go “green,” look for claims that give some substance and additional information that explains why the product is environmentally friendly or has earned a special seal. For more about recycling, check the website of the Federal Trade Commission (<http://www.ftc.gov>) or the Environmental Protection Agency (<http://epa.gov>).

FIGURE 8-13 Check products for this symbol to determine if they are environmentally friendly.

is full. Avoid wearing loose-fitting clothing while operating a shredder to prevent an accident or personal injury.

When to Shred Materials Medical practices need to eliminate old patient records and other sensitive materials. These items cannot simply be thrown into the trash because of confidentiality problems. The shredder is an effective disposal solution. If records have incorrect information that has been corrected on subsequent documents, the old records are shredded to prevent incorrect information from being mistakenly placed in the patient's folder. A document that has been shredded cannot be put back together, so do not decide on your own to shred a document. The physician or office manager will set guidelines regarding when a document should be shredded. If you are not sure whether to shred a document, check with a senior staff member before beginning the process.

Shredding Vendors Many medical practices contract with a shredding company to come into the practice to remove and then shred designated materials. Using another company for this task does not relieve the medical practice of the responsibility for the confidential materials. The healthcare provider is still considered the **covered entity** and must comply with HIPAA law. It is important to contract only with companies that also abide by HIPAA confidentiality statutes.

► Purchasing Decisions for Office Equipment

LO 8.9

As the office medical assistant, in addition to your possible role in making purchasing decisions for computer equipment, you also may be involved in helping to select the most appropriate office equipment. You may be asked to investigate whether the practice needs a new photocopier or whether hiring a shredding company makes sense for the office. To make a sound decision about whether the office will benefit from such a purchase, you will need to conduct thorough research, documenting your findings for further discussion.

Evaluating Office Needs

The first step in evaluating the equipment needs of a health-care office is the research process. Make note of the equipment that is already available and consider the different tasks this equipment can perform. To obtain a complete list of office needs, ask other staff members for their ideas.

When considering the replacement of an old piece of equipment, ask what advantages the new piece of equipment offers over the current one. Create a list of equipment on hand and a list of any new products the office staff recommends. Compare the benefits offered by the new product to the capability of the currently used equipment. Many medical magazines review medical office equipment periodically and are good resources to consult in making your purchasing decisions. Go online to shop and compare products, features, and prices. Discuss with the office manager the budget for the equipment under consideration. Consider calling a supplier for more detailed information.

Contacting Suppliers Put together a list of the features you would like in your piece of equipment. Then contact suppliers who sell models that offer those features. You can call or e-mail the manufacturer directly to find out the name of a local vendor. Many manufacturers prepare brochures giving information about their products. Request that this information be sent to you.

Go online or look in the Yellow Pages for office supply stores and other companies that sell office equipment. Obtain product and pricing information on each model. For certain equipment, such as photocopiers, a sales representative will come to your office to demonstrate and discuss the product.

Evaluating Warranty Options Most products come with a warranty, which is a contract that guarantees free service and parts replacement for a certain period, usually 1 year. Warranties are valid only for specified service and repairs. They usually do not cover accidents, vandalism, acts of God (such as damage caused by floods or earthquakes), or mistreatment of the machine. In most cases, warranty repairs must be made at an authorized service center.

If you want more coverage than the warranty allows, consider buying an extended warranty. Extended warranties increase the amount of time that equipment is covered. For expensive equipment or parts, the additional cost of an extended warranty may be justified.

After you purchase a product, you must fill out the warranty card and mail it to the manufacturer. File the receipt in a safe place in the office where it can easily be retrieved.

Preparing a Recommendation After you have obtained all the information, you are ready to evaluate it. To compare and contrast the different models, construct a chart. Place the product model names in columns across the top. Down the left side, list factors that will influence the purchase decision: cost, warranty options (including the length of the warranty and the price of an extended warranty), special features, and delivery time. Then fill in the information. This chart will provide an easy-to-use summary of your research. Finally, analyze the list and choose the product that will best meet the office's needs. Meet with the physician or office manager to discuss your recommendation.

Leasing Versus Buying Equipment

Once the product has been selected, there is one more decision to make: whether to lease or buy it. When buying a product, the purchaser becomes the owner. Owners are free to do with the product anything they choose, which may include selling it to someone else.

For most large pieces of office equipment, like photocopiers, there is also an option to *lease* the equipment. Leasing, or renting, usually involves an initial charge and a monthly fee. On average, the initial charge is equal to about two monthly payments. The ownership of a leased piece of equipment is retained by the leasing company.

Lease Agreement A lease is for a specified time, after which time the equipment is returned to the seller per the lease agreement (Figure 8-14). Some leases allow purchase of

the equipment at the end of the rental period for an additional payment. The details of the purchase option are covered in the lease agreement.

Advantages and Disadvantages of Leasing When you lease a product, your office does not own it, but you have several advantages.

1. Leasing allows purchasers to keep more of their money. The initial cost of obtaining the machine is a fraction of the full cost of purchasing it. So the remainder of the money can earn interest in the bank or be used for other expenses. Leasing is advantageous when you do not have enough money to buy the equipment but need the services it provides. In addition, leasing allows businesses to update equipment every few years at the end of each lease period. Updating may not be as affordable if you buy equipment.
2. Often the company that leases the product is also responsible for servicing it.
3. In most cases, businesses are able to take lease payments as a tax deduction each year.

But leasing is not always the best solution—you will not own the equipment, so the office will not gain any equity for the money it is spending on it. It is important to weigh the

advantages of leasing against the advantages of buying equipment for your medical practice.

Whether you decide to lease or buy, always ask whether the price is firm or if there is room for negotiation. Many available discounted rates are not extended to a customer simply because the customer did not ask. Although some equipment prices are nonnegotiable, terms can sometimes be negotiated on more expensive pieces of equipment. Companies that lease office equipment are often flexible in determining the monthly payment. For example, equipment companies may accept smaller payments in the beginning of the rental or purchase agreement period and require larger payments near the end.

In a competitive market, some suppliers may match their competitors' prices. When purchasing several pieces of equipment at the same time, a supplier may be able to offer some savings on the total cost of the purchase or provide some service, such as free delivery, or an extension on the service contract.

► Maintaining Office Equipment LO 8.10

Office equipment (as with computers) must be regularly maintained to provide optimum service. Daily or weekly maintenance, such as cleaning the glass on the photocopier or replacing toner, can be performed by the office staff.

However, more extensive maintenance should be done by the equipment supplier. Consult the equipment manual for details about the care of each piece of equipment.

Equipment Manuals

The best source of information about maintaining a piece of equipment is the manual that comes with it. This booklet gives basic information about the equipment, including how to set it up, how it works, special features, and problems you may encounter. The information in an equipment manual is extremely valuable. If the manual is lost, call the manufacturer or research the Internet to obtain another one. Equipment manuals should be stored where they can be retrieved easily. Some large pieces of office equipment provide racks or slots on the side of the equipment for manual storage.

It is helpful to write the following information on the inside front cover of the equipment manual upon initial setup. If there is a problem with the equipment that requires a maintenance call, this valuable information will be quick and easy to retrieve.

- The date of purchase or lease
- The serial number of the equipment
- The phone number of the company contracted to repair the equipment

Maintenance and Service Contracts

Equipment suppliers provide standard maintenance contracts when office equipment is purchased. A maintenance contract specifies when the equipment will be cleaned, checked for worn parts, and repaired. A standard maintenance contract may include regular checkups as well as emergency repairs.

In addition, some suppliers offer a service contract, which covers services that are not included under the standard maintenance agreement, such as emergency repairs. In some cases, service contracts are combined with maintenance contracts in one document.

Make sure to keep track of all maintenance performed on your equipment. Many offices have a maintenance log, where staff members record the date and purpose of each service call. This log is helpful in identifying whether equipment should be replaced because of the need for frequent servicing.

Troubleshooting

Before calling the service supplier for service on any piece of equipment that appears to be malfunctioning, steps should be taken to determine if you can correct the problem yourself. This process is called “troubleshooting.” Resolving the problem can save you the cost of a service call that may not be covered by the standard agreement.

The first step in troubleshooting is to eliminate possible simple causes of a problem. For example, if the equipment is powered by electricity, make sure that it is plugged into a functioning outlet and that it is turned on. Are all doors and other openings in their correct positions? Are all machine connections firmly in place? If you cannot discover a simple cause for the problem, it is time to test the machine to determine what it is failing to do. In the case of a malfunctioning photocopier,

for example, try making a copy and note the response. Write down any error messages the machine provides.

Next, consult the equipment manual. Many manuals devote a section to troubleshooting. If you cannot find the solution after reading the manual, call the manufacturer or the place of purchase for additional assistance. Be prepared to explain the steps you have already taken toward resolving the problem.

Backup Systems

Earlier in the chapter, you read about the importance of having a backup system for the office’s computer system(s) and the information contained within it. It is also important to have a “backup plan” in case of other equipment failure. Occasionally, more than one piece of equipment can be affected by a single problem. For example, if the electricity goes off, all electrical equipment will go out at once. To avoid losing important information and records, it is important to have backup systems in place.

Telephones The use of cell phones in addition to traditional phones offers a backup to communication in the event that phone service is interrupted. Cell phones are also helpful during emergency weather conditions.

Electricity An emergency generator may supply emergency power for lighting in key hallways and exam rooms. Interior rooms and halls can quickly become very dark and hazardous when the electricity is unexpectedly cut off.

Battery Power Battery power backup is a key component of security and warning system backups. Audio warning signals sound when it is time to replace the batteries in smoke and security detectors. All batteries should routinely be replaced every six months.

Fire Extinguishers Fire extinguishers need to be serviced or replaced once a year to ensure maximum performance. The office may choose to contract with a local company to provide this annual maintenance evaluation.

Equipment Inventory

Office equipment, such as photocopiers, scanners, telephone systems, examination tables, ECG machines, lab equipment, and even reflex hammers and thermometers, is part of the medical office’s assets. As such, they must be maintained and inventoried on the practice assets and liabilities balance sheet.

Traditionally, medical office equipment inventory was done manually using a master inventory such as that shown in Figure 8-15. Information kept in the master inventory log often consisted of the following items:

- Name of the equipment, including the brand name
- Brief description of the equipment
- Model number and registration number
- Date of purchase
- Place of purchase, including contact information
- Estimated life of the product
- Product warranty
- Maintenance and service contracts

6. HYtech 17-inch LED monitor	03/10/15	\$200.00

FIGURE 8-15 Traditional equipment inventory, including the name and quantity of each equipment type.

With many medical offices now computerized, inventory control is no longer a manual process for these offices. Most practice management software programs for the medical office include some form of inventory control management. The information contained within the software may be the same as that in a manual system, but updates and changes are now computerized. Depending on the size of the office, bar codes, similar to those used in retail establishments, may be affixed to equipment to assist with tracking. If your office is computerized but does not run a full practice management program, there are also separate inventory control software packages available, such as Fishbowl and Intellitrack. Remember, when considering any software program, make purchasing decisions based not only on whether the program will suit the practice today but also whether it will be able to grow and expand with the practice tomorrow.

► Maintaining Medical Office Supplies

LO 8.11

Purchasing and maintaining the office supplies and equipment in a medical office is an essential skill in managing the office. You may be responsible for evaluating and recommending equipment and supplies, taking inventory of equipment and supplies, and negotiating prices with suppliers. When managing office supplies, your goal is to achieve efficiency, which is the ability to produce the desired result with the least effort, expense, and waste (Figure 8-16). Factors such as environmental friendliness—particularly with paper products—should be considered as well. For more information, see the feature *Points on Practice* feature on recycling supplies.

The word *supply* refers to an expendable item, or an item that is used and then must be restocked, like examination table paper. Ideally, office supplies are stored on labeled shelves.

Determining Responsibility for Organizing Supplies

The medical assistant is often responsible for organizing office supplies. In a small practice, one medical assistant may be able to handle this responsibility alone, but a practice with several physicians may require more help to manage supplies. When

FIGURE 8-16 Keeping an up-to-date, organized inventory of supplies is crucial to a well-run office.

© McGraw-Hill Education. David Moyer, photographer

two medical assistants handle this responsibility, one is often assigned to handle administrative items and the other to handle clinical (medical) supplies. In a very large practice, a third assistant might handle computer, copier, and fax supplies.

Categorizing Supplies

Most medical office supplies fall into two main categories: administrative and clinical. Examples of administrative supplies include items that are used in the office portion of the practice, such as stationery, insurance forms, pens, pencils, and clipboards. Clinical supplies are medically related and include alcohol swabs, tongue depressors, disposable tips for otoscopes, and disposable sheaths for thermometers.

General supplies are used by both patients and staff. Examples of general supplies include paper towels, liquid hypoallergenic soap, and facial and toilet tissue.

The Supply List As discussed earlier, if the office is computerized, it is likely that both the equipment and supply inventories are computerized. To assist with inventory management, many of these systems use a bar code or other method to allow usage be tracked. By scanning the bar code as a box of supplies is opened or used, the inventory amount is adjusted accordingly within the computer system. By monitoring these numbers, you will know when specific supplies require ordering to ensure that you never run out of crucial supplies.

Regardless of how the office supply inventory is maintained, a master supply list will need to be created and maintained. One helpful way to track administrative, clinical, and

general supplies is to subcategorize them in accordance with their importance within the practice. Many offices use three categories for this purpose: vital, incidental, and periodic use. The placement of supplies within each subcategory may vary depending upon the type of practice. For instance, an office specializing in pediatrics may consider the clinical supply of topical skin freeze as a vital supply for their young patients, but a cardiac office may consider it incidental. Table 8-2 lists some common supplies by their main category of administrative, clinical, or general. Think about the type of practice you

might like to work in and what subcategory (vital, incidental, or periodic) these supplies might fall into.

Vital Supplies These items are absolutely essential for the practice's functioning. They include paper examination table covers and prescription pads. Without these items, the physicians and other licensed practitioners would be unable to work in a clean examination environment or to readily prescribe medication for patients during office visits. Another type of vital supply is an item that requires a special

TABLE 8-2 Typical Supplies in a Medical Office

<i>Administrative Supplies</i>	
Appointment books, daybooks (still used in noncomputerized offices)	Insurance manuals
Back-to-school/back-to-work slips	Local welfare department forms
Clipboards	Patient education materials
Computer supplies	Pens, pencils, erasers
Copy and facsimile (fax) machine papers	Prescription pads
File folders, coding tabs	Rubber bands, paper clips
HIPAA forms (Notice of Privacy Practices, authorization forms, disclosure logs, request to inspect/copy medical records forms, request for amendment forms, acknowledgment of request for amendment forms)	Registration forms
History and physical examination sheets/cards	Social Security forms
Insurance forms, disability, HMO and other third-party payers, life insurance examination forms, VA and W/C forms	Stamps
	Stationery, appointment cards, bookkeeping supplies (ledgers, statements, billing forms), letterhead, second sheets, envelopes, business cards, notebooks, notepads, telephone memo pads
<i>Clinical Supplies</i>	
Alcohol swabs	Safety pins
Applicators	Silver nitrate sticks
Bandaging materials: adhesive tape, gauze pads, gauze sponges, elastic bandages, adhesive bandages, roller bandages (gauze and elastic)	Suture removal kits
Cloth or paper gowns and drapes	Sutures
Cotton, cotton swabs	Examination table covers
Culture tubes	Tongue depressors
50% dextrose solution	Topical skin freeze
Disposable sheaths for thermometers	Urinalysis test strips
Disposable tips for otoscopes	Urine containers (sterile and nonsterile)
Gloves: sterile and nonsterile examination	Injectable medications: diazepam (Valium), diphenhydramine hydrochloride (Benadryl), epinephrine (Adrenaline), furosemide (Lasix), isoproterenol (Isuprel), lidocaine (Xylocaine: 1%, 2%, and plain), meperidine hydrochloride (Demerol), morphine, phenobarbital, sodium bicarbonate, sterile saline, sterile water
Hemocult test kits	Other medications, chemicals, solutions, ointments, lotions, and disinfectants, as needed
Iodine or Betadine pads	
Lancets	
Lubricating jelly	
Microscope slides and fixative	
Needles, syringes	
Nitroglycerine tablets	
<i>General Supplies</i>	
Liquid hypoallergenic soap	Tampons and sanitary pads
Paper cups	Tissues: facial and toilet
Paper towels	

order, such as a printed form. Special orders take time to obtain, so they must be ordered well before supplies run low.

Incidental Supplies These supplies are needed in the office but do not threaten the office's efficiency if the supply runs low. Incidental supplies include staples and rubber bands, which can be purchased at a local stationery store.

Periodic Supplies These supplies require ordering only occasionally. For example, if your office uses appointment books, you will order them only once or twice a year, probably in small numbers. The urgency of ordering some periodic items can depend on the size of the office. A multiphysician office, for example, would require more copy paper than a single-physician office. Another example of a periodic item might be holiday cards to send to the physician's colleagues and patients.

Storing Office Supplies

Storing office supplies requires good organizational skills and attention to detail. Many people in an office use these supplies, so the items should be stored neatly and in an orderly way. In addition, it is important to store supplies safely to prevent loss or theft, damage, or deterioration.

Location In a small medical office, supplies are generally kept near the areas where they are used. For example, administrative supplies are usually stored behind or adjacent to the reception area, while clinical supplies are stored near the examination rooms. If the practice has a laboratory, pertinent supplies are stored in or near the laboratory. Offices with separate supply rooms offer more storage space.

Small medical offices may not have ample storage space, so it may be tempting to store boxes on the floor behind the air-conditioning unit, stacked up close to the ceiling, or in potentially hazardous locations, such as near a heat source. However, it is essential that supplies be stored according to the guidelines described by The Joint Commission (TJC).

Items may not be stored on the floor; instead, they must be raised off the floor, as on a crate or shelf, to avoid contamination by water. Items stored close to the ceiling are considered a fire hazard. TJC standards require that supplies stored on the top shelf of a closet or storage area be at least 18 inches below the ceiling.

Avoid storing any boxes or supplies near a water heater, air-conditioning unit, heater, or stove. Many expendable items and their packaging are combustible and can quickly become a fire hazard. Air-conditioning units may drip water on the floor. If boxes of expensive forms are stored nearby, they can quickly become ruined as water seeps unnoticed into the packaging.

Storage Cabinets Each storage cabinet should be labeled with a list of its contents. Keep all stock of one item together.

Finding supplies is easier if you keep small items at eye level. Put large, bulky goods, like reams of stationery, on lower shelves. Label boxes and containers clearly so that all employees can readily find what they need and so that the inventory process is easier.

As you initially arrange items on storage shelves, label the shelves. Reserve enough space to completely stock each item. Do not put anything but the appropriate item in each

designated space. This easy system allows for a quick review when you reorder supplies, particularly if your office is using a manual inventory system.

To reduce the risk of errors on reorders, keep each item's original label attached to it. Cover the label with clear tape, if necessary. If you must replace a worn label, do it immediately when needed, making sure the new label has the same detailed information as the old one. Bottles with pouring spouts should be labeled on the side opposite the spout to prevent the liquid from dripping onto the label. Use a laundry marking pen to label linens with the name of your office. Linen services usually premark linens with the name of the company or the practice.

Many items have a shelf life after which they are no longer usable. By not overordering and by rotating supplies—using older ones first—your office will be able to use items during their shelf life. This is true not only for perishable items like medications but also for linens and paper, which can deteriorate.

Store all items based on their expiration date, so always check the dates on new items as well as those already in inventory. The oldest items should be stored in the front and the newer items stored in the rear of the cabinet. Be sure to rotate the inventory every time you add new stock, placing items with the longest expiration date at the back of the shelf. Because items can sometimes expire before they are used, be sure to check every item for the expiration date before use. Discard all expired items carefully and appropriately according to TJC and OSHA standards.

Administrative Supplies In addition to such expendable items as pens, pencils, and paper clips, paper products are important to a medical office. In general, paper products should be stored flat in their original boxes or wrappings to prevent pages from bending or curling. Information booklets may be stored upright to save space. Envelopes and other paper goods with gummed surfaces must be kept dry to prevent them from sticking together.

Clinical Supplies The rules of good housekeeping and asepsis creating the germ-free environment discussed in the *Infection Control Fundamentals* chapter apply not only to the daily office environment that is visible to patients, physicians, and office staff, but also to storage areas for clinical supplies. These areas must be kept clean and protected from damage and exposure to the elements.

All dressings and most bandaging materials must be kept sterile, including gauze that may be used to bandage an open wound. Elastic rolled bandages, which do not touch open wounds, must be clean but not necessarily sterile.

Chemicals, drugs, and solutions should be kept in a cool, dark place because light and heat cause some substances to deteriorate. Refer to the Safety Data Sheet (SDS) provided by each manufacturer for proper storage instructions. The importance of SDS is discussed in detail in the *Infection Control Fundamentals* chapter, but here are some basic guidelines:

- Store all liquids in their original containers. Line cabinets with plastic-coated shelf paper and wipe it frequently with a damp cloth. Do not store liquids above dry supplies.
- Store all poisons and narcotics separately from each other and from all other products.

- Narcotics must be stored securely out of sight in a locked cabinet.
- Never store strong acids near alkaline solutions or flammable items near sources of heat. Solutions that will be stored for a considerable length of time should have a small amount of space at the top of the bottle to allow for heat expansion.
- Some liquids should be stored in the refrigerator.
- Again, check each item for specific storage instructions. If storage space is limited, consider eliminating some items—especially bulky ones that are rarely used or items that a patient can purchase at surgical supply stores.
- Clinical refrigerators may be needed to store certain clinical supplies that require refrigeration. Never store food items and clinical items in the same refrigerator. A clinical refrigerator must be kept at a constant temperature to properly maintain the chemical integrity of lab supplies. Monitoring and recording the date and temperature of the clinical refrigerator should be completed once a week or per office protocol. Refer to each SDS for storage details on each substance.

▶ Taking a Supply Inventory

LO 8.12

As you discovered earlier, the responsibility of maintaining office supplies often falls to the medical assistant. It is a job that requires careful planning, attention to detail, and basic math skills. Accurate inventory activity ensures that the office never runs out of much-needed supplies.

Understanding Your Responsibilities

Generally, you will be responsible for overseeing the flow of supplies bought and used, calculating the budget for supplies, selecting supplies and vendors, following correct purchasing and payment procedures, and storing the goods properly.

All efficient offices will have a process for everyone within the practice to record their supply needs. The process may be as simple as a notebook stored at the front desk or a supply list positioned in a key location. As a supply need in the office is noted, it can be recorded on the supply list by anyone for the next order. Then, the medical assistant who is compiling the order should check all the inventory cards, reorder reminder cards, and supply lists, if using a manual system, before ordering.

If a computerized system is used, you will check the computerized sheet for usage as well as the office “wish list” before ordering supplies that are either low or needed but not currently purchased regularly for the office.

The Inventory Filing System

To oversee the flow of inventory efficiently, you will need a filing system. See Procedure 8-5 at the end of this chapter for a step-by-step overview of a manual inventory process. For computerized systems, the process will vary depending upon the system you are using, but the basic concept remains the same. The manual system consists of several elements:

- The list of supplies (discussed earlier in the chapter)
- An itemized inventory
- An inventory card or record page for each item
- A list of the names and addresses of current vendors
- A file of current catalogs from vendors (including some vendors not currently used, for comparison shopping)
- A wish list of brands or items that the office does not currently use but may want to try in the future
- Files for *invoices*, or bills from vendors, and completed order forms
- Reorder reminder cards to indicate when an in-stock item should be reordered
- Color-coded, removable, self-adhesive flags to indicate “Need to Order” or “On Order”
- An inventory and ordering schedule
- Order forms for each vendor (may be multicopy forms, fax forms, electronic forms, or e-mail forms)

The Inventory Card or Record Page The inventory card or record page for each item or category of items may be a 4 × 6 inch index card, a page in a loose-leaf binder, or a spreadsheet stored in the computer system (Figure 8-17). These methods make it easy to group together the items that need to be ordered at any given time. Records help you monitor how quickly items are used and how much should be ordered each time.

Of course, some information may change. As you become more proficient at monitoring inventory or as the practice grows or diminishes in size, you may find that quantities, vendors, or reorder quantities need to be adjusted. With the help of the doctor or office manager, you will be able to determine the ideal quantity of each item to have on hand, depending on the size of the practice, the available storage space, and the ordering schedule.

Be sure to check the storage areas regularly, preferably at specific times, and to count the items on hand. When the supply of an item begins to run low, you (or another staff member) should flag the inventory card or record page to indicate the need to reorder it at the next regular ordering time.

Color-coded, removable, self-adhesive flags on the inventory card or record page are an efficient way to track inventory. A red flag, for example, might indicate that a supply needs to be ordered. A yellow flag might be substituted when the item has been ordered.

Reorder Reminder Cards Reorder reminder cards (Figure 8-18) are usually brightly colored cards inserted directly into stock on the supply shelf to indicate when it is time to reorder an item. For example, if you have determined that four boxes of staples is a sufficient quantity to keep on hand and

FIGURE 8-17 An inventory card may be manually created or computer generated.

FIGURE 8-18 Reorder reminder cards are typically brightly colored cards inserted within the current supply stock, reminding you when it is time to reorder the item.

your office supply orders are filled in 2 business days, you might place the reorder reminder card between the third and fourth boxes of staples. The reorder quantity on the inventory card or record page for staples would indicate “four boxes.”

The reorder reminder cards also remind other staff members to tell you when an item is in short supply. In some offices, the medical assistant labels the reminder card with the supply item’s name and bar code number, such as “staples 002345.” This method allows any staff member to pull the card when the last box of staples before the reminder card is taken from the supply shelf. The staff member can then place the card in a “To Be Ordered” envelope. Some offices can reorder simply by scanning the bar code. Staff members in some offices request supplies by writing them in an order book or on an order list.

Scheduling Inventory and Ordering

Establish a regular schedule for counting the office supplies, such as taking inventory every 1 or 2 weeks. Estimating when you will probably need to reorder a particular item—and putting that date on your calendar or in your appointment book—is also helpful. You and the physician can determine how often storage areas should be checked.

Established Ordering Times You should have established ordering times, such as the same day each week or

month, after inventory is taken. For example, you might take inventory the first Tuesday of every month and order supplies the first Thursday of every month.

A regular schedule for taking inventory and ordering helps all staff members remember when they must give their requests to you. Although you may need to adjust the ordering time occasionally, try to stick to the schedule to avoid the expense and inconvenience of rush orders.

When to Order Ahead of Schedule When you take inventory and the spare supply of an item has not been reached but is close to the placement of the reorder reminder card, you must decide whether you should reorder then or wait until the next regular ordering time. You will probably find it is more efficient to go ahead and order rather than wait. Ordering early assures you that the supply will not be depleted before the next regular ordering time. Make sure you consider your storage capacity, as this could limit your purchases.

Ordering ahead of schedule can be especially important if there is a large demand for a particular product and manufacturers' production levels have not caught up with that demand. This situation can occur if there has been an outbreak of a particular flu or virus, or if the Food and Drug Administration has determined that a certain product is harmful, resulting in higher demand for an alternative product.

Unanticipated Shortage of a Supply Item If the supply of an item reaches the reorder reminder card, and there is still a long time before the next regular ordering time, place the order immediately so that you do not risk running out of the item.

To help you oversee inventory effectively, finish one container before opening a new one. Keep all stock of the same item in one place, as the need to count inventory of an item in more than one location or container increases the likelihood of errors. If an item is kept in more than one location, as in the case of multiple exam rooms, inventory is best maintained per room.

As a medical assistant, you want to be sure that there are always sufficient quantities of supplies to keep the office running efficiently. It is unwise to stock spare supplies in too great a quantity, however, because the administrative budget is not likely to support such expenditures. In addition, spare quantities of supplies can be a storage problem.

► Ordering Supplies

LO 8.13

Ordering supplies requires a procedure to deal with vendors and to order and check supplies. You can avoid common purchasing mistakes by understanding the most efficient way to order supplies for your office.

Locating and Evaluating Supply Vendors

A vendor will most likely already be in place when you join a practice. You should, however, be aware of competitors' prices, services, and other incentives intended to attract your office as a customer. Sometimes the incentives, such as bonus supplies with certain purchases, can represent sizable savings. Remember also that your time has a dollar value to the

practice and services that save you time are worth comparing when evaluating vendors.

Obtaining recommendations from other medical offices is a good way to locate reputable office-supply dealers who sell items at reasonable prices. Reputable vendors fulfill orders accurately with quality items, deliver products in good condition, and charge fair prices. Keep in mind when evaluating vendors that the physician may have preferences for certain trade names or vendors.

Gathering Competitive Prices The costs of maintaining a medical practice are continually rising. Saving money on supplies through careful purchasing strategies is one way to help your physician/employer reduce spending. The medical assistant is often largely responsible for comparison pricing, ordering, and establishing and maintaining relationships with vendors. Your awareness of the most up-to-date information about vendors and supplies is valuable to your physician/employer. Discuss prices with the physician, who in turn may want to discuss them with an accountant.

Setting Up a Supply Budget The average medical practice spends 4% to 6% of its annual gross income on administrative, clinical, and general supplies. If an office is spending more than 6%, it may be time to reevaluate the office spending practices. Remember, though, that any budget is only a guide. A budget is meant to serve your office, not the reverse. You and your physician/employer may need to adjust the supply budget based on prices and discounts available from vendors.

Comparing Vendors To collect competitive data from vendors, check their website or contact them by telephone or in writing to request catalogs and other forms of product information. If you are not in charge of routing mail, make sure that supply-related mail, such as product catalogs and sale notices, is routed to you. Websites and catalogs (electronic or printed) usually include basic information such as the dealer's name, address, and telephone number; order numbers for items; and vendor policy (see Figure 8-19). When investigating a vendor, obtain the following information:

- Prices—costs for supplies, delivery, and any other services; special discounts; minimum quantities applicable; and bonus supplies with purchases
- Quality—product descriptions, illustrations, trade names, recommendations for use, durability, and guarantees
- Service—availability of products, delivery time and procedures, sales representative availability, and damaged goods policy
- Payment policies

Competitive Pricing and Quality

Part of your responsibility in managing office supplies is to stay informed about the pricing and quality of competitors to your vendors. Savings can add up quickly, and ongoing comparison pricing can save the practice hundreds of dollars a year.

Unit Pricing Because many medical items come in a variety of package sizes, you need to be aware of how much the

Bibbero Systems, Inc.
1300 N. McDowell Blvd.
Petaluma, CA 94954-1180

BY FAX

Complete enclosed order form and transmit via fax to:
(800) 242-9330.
Our fax line is open 24 hours a day.

SHIPPING POLICY

Most in-stock items normally ship the same day (exclusive of file cabinets, file storage, office accessories and furnishings).

FREE DELIVERY

Free delivery on pre-paid orders totaling \$300.00 or more, shipping within the Continental US.

BIBBERO
SYSTEMS, INC.®

Thank you for reviewing our catalog. We are confident that you will be pleased with both our products and our service. If you are in a hurry for product or samples, CALL us toll-free at (800) BIBBERO, FAX us at (800) 242-9330, or visit our website. Our Customer Service Department is always happy to assist you.

If ordering by mail or fax, fill out the enclosed order form located at the back of this catalog. Either return it in the enclosed postage-paid envelope or fax it to us.

For items requiring custom imprinting, please include the following information, either typed or hand printed: name, specialty, address, city/state/zip, telephone number, and state license number (when required).

Don't see what you are looking for in our catalog? Submit a sample or provide specifications for any folder, divider, patient registration form, clinical form, health history questionnaire, etc., and we will promptly provide you with a quote. We can print single or multiple part forms, custom imprint folders, and manufacture a wide range of chart dividers.

Please Note: All custom printed orders are subject to an overrun or underrun variance of 10%.

Most orders for in-stock items received by 2:00 p.m. (PT) are normally shipped the same day (excluding cabinets, file storage, office accessories and furnishings). Out-of-stock items are automatically backordered. Personalized stationery items normally ship in 5–7 working days, after proof approval. Custom printed orders normally leave our plant within 7–10 working days, after proof approval. If certain items require an extended ship time, such as those listed above, delivery time will be quoted when order is received.

Custom printing or personalization on a rush basis is available on most products for an additional charge.

Some combined stock and custom printed items can be shipped together if requested in advance. All orders are shipped via the most economical, expeditious method to your locale. Items ordered together may not ship from the same locations or be received at the same time.

Common carriers are used for large volume orders. Overnight, 2nd and 3rd Day delivery services are available upon request.

All orders prepaid by check, Visa, MasterCard or American Express totaling \$300.00 or more will be shipped freight free via surface transport within the Continental US. This offer excludes file cabinets, file storage, office accessories and furnishings and special order items. We regret that the high cost of shipping outside the contiguous 48 states prohibits us from extending our freight free policy; however, we will use the most economical shipping methods available to your location.

TERMS

Full payment is due upon receipt of merchandise. Accounts are considered overdue after thirty (30) days and are subject to a 1% monthly service charge. A service charge of \$10.00 will be applied to all returned checks. For information regarding special financial arrangements, please contact our Credit Department at (800) 242-2376.

GUARANTEE!

Your satisfaction Guaranteed!

We guarantee our stock products. If you wish to return something, call to obtain a return authorization number and return shipment instructions. Most of our stock items can be returned within 60 days of purchase for full credit, exchange or a refund of your purchase price, with prior return authorization. After 60 days, your return is subject to a 20% restocking charge. Call our Customer Service Department at (800) 242-2376 for your return authorization number. Dymo® Products can be returned within 30 days of receipt with prior return authorization. Opened or unpackaged items are subject to a 15% or \$15.00 restocking charge, whichever is greater. For disposable products located in our Clinical Supplies section, opened packages are subject to a 15% restocking charge with prior return authorization. Personalized items, custom printed items, custom manufactured or special order items, file cabinets, high density filing systems and opened and unlocked software are not returnable.

Items damaged in transit will be replaced as quickly as possible. Note any visible damage to the cartons on the bill of lading or delivery receipt and keep the original packaging in case items within are damaged.

Please Note: Self-adhesive products have a limited shelf life. Store in a cool, dry place.

Please Note: All custom printed orders are subject to an overrun or underrun variance of 10%.

We accept Visa, MasterCard and American Express for all your purchases.

FIGURE 8-19 Examine supply catalogs and websites closely to obtain the best value for the office.

office is actually paying per item. To calculate an item's unit price, divide the total price of the package by the quantity, or number, of items. For example, if a package of 12 pens costs \$12, the unit price, or price per pen, is \$1 (\$12 divided by 12 pens). If another vendor provides the same type of pen in a package of 18 for \$17.10, the unit price is 95 cents (\$17.10 divided by 18 pens). The second set of pens is the better buy.

Unit prices are generally lower at larger quantities. So it makes sense to place one large order for a nonperishable item to cover the office until the next ordering time. Generally, however, you should not order more than a year's supply of any one item, particularly if the item is custom printed. Addresses, insurance codes, or additions to medical staff can change. When placing quantity discount orders, always consider the following factors:

- Whether the supply can be used within a reasonable time
- The possibility of spoilage or deterioration
- The amount of storage space in the office
- Whether the doctor will continue to use the item

Avoid overspending by not ordering more of an item than is reasonable or necessary.

Rush Orders Unexpected rush orders usually cost the office more money than regularly scheduled orders. (In some cases, a vendor may not charge extra to a steady customer, but these cases would be exceptions.) To avoid rush orders, be aware of approximately how long the vendor takes to deliver an order. You can obtain this information from the vendor policy and by keeping accurate records of your own experience with deliveries.

Mail-Order Companies Using large, established mail-order companies often saves money for the medical office, but there may be less control over orders and a greater potential for hidden costs. The neighborhood pharmacy may also offer discounts, but ordering from wholesalers or directly from the manufacturer is usually more economical. See the *Points on Practice* feature for helpful information about cost-efficient ordering by telephone, by fax, or through an online service.

Purchasing Groups Purchasing groups are groups of practices that order supplies together to obtain a quantity discount. For example, several medical offices associated with a nearby hospital may order through the hospital. In return for this convenience, the physicians pay dues and guarantee the vendors a certain amount of business. Some programs require members to spend a certain percentage of their supply budget through the group. Groups also may require that members not disclose the group's prices to other physicians. Large medical practices that participate in these groups usually save an average of 20% on supplies. The savings are not usually significant for small offices.

Group Buying Pools If a medical office wants to use local vendors instead of, or in addition to, a purchasing group or if it is too small to benefit from a purchasing group, it can still pool resources with other area offices to qualify for quantity discounts. Even if the offices are ordering different items, discounts are based on the total order and savings can range from 10% to 20%. Under this arrangement, the offices must usually take responsibility for distributing the items among

FIGURE 8-20 Jointly ordering supplies with other practices can cut down on costs for everyone.

© McGraw-Hill Education

themselves. A buying pool is convenient for medical practices that are in the same building or office complex (Figure 8-20).

Cost Controls Medical practices are increasingly interested in saving money and controlling costs in general. Physician reimbursement is constantly being reevaluated. As a result, more than ever, physicians are interested in controlling the operating costs of their practices. Managing expenses within the practice is a very important responsibility for the medical assistant. What may seem to be just a small reduction in cost to the practice can actually result in a substantial reduction to office expenses over the course of a year. As a medical assistant, it is your job to constantly look for ways to reduce costs within the practice without sacrificing quality.

Benefits of Using Local Vendors

There are many potential vendors, including local dealers, mail-order companies, and nearby pharmacies. Try to establish good credit and business relationships with reputable local vendors. Although these companies usually charge a little more than mail-order companies, spending most of the office's supply budget through one favored local dealer often results in discounts, special service in the event of an emergency, and information about upcoming sales and specials. Local dealers also may offer more personal assistance—perhaps even a salesperson's help with taking inventory—to compete with larger vendors whose business is based primarily on catalog sales. The extra service may be worth the higher cost.

Buying from local vendors also can provide a public relations benefit for physicians; it means keeping business in the community. However, specialty items may need to be ordered from other vendors. For example, letterhead should be ordered from a reliable printer, whether that printer is located in the community or out of state.

Payment Schedules

Another factor that affects the cost of supplies is the payment schedule. Many vendors do not charge for handling if an order is prepaid. Others offer a discount for enclosing a check with an order. Some delay billing for 30 to 90 days, allowing the practice to keep the money in the bank, collecting interest for a longer period.

POINTS ON PRACTICE

Ordering by Telephone, Fax, or Online

You may occasionally purchase office supplies at a local office supply store, but usually you will order them without even leaving your office. Three common ways to do so are by telephone, by fax machine, and through an online service. The following tips are included to help you make sure that every order—no matter which option you choose—is successfully placed.

Ordering by Telephone

1. Clear communication is a must when ordering by telephone. Speak slowly and enunciate your words carefully to make sure you are understood. It is also a good idea to spell each word of the practice name and the address to ensure proper delivery. Use expressions like “S as in Sam, P as in people” to clarify your spelling.
2. Ask the representative taking your order to repeat the order. Check that every item is included with the appropriate price, quantity, style, and color.
3. Confirm the expected delivery date so that you will know if something is late. Also confirm how payment will be made, to prevent unexpected delays.
4. Record the name and telephone number of the person who takes the order in case there is a problem with the order. Get an order number (or confirmation number) in case you have to call back with a question or a change in your order.
5. If possible, avoid placing telephone orders on Mondays and Fridays, when call volume is typically high.

Ordering by Fax

1. When ordering by fax, use the form provided by the vendor if one is available. This form uses the format to which the supply company is accustomed and will speed your order’s processing.
2. Type your order, or write it neatly and legibly, to prevent miscommunication. Fill out the form completely. Make sure you indicate quantities, descriptions, and prices (including shipping) for each item you order.
3. Proofread your order before you send it. Checking the accuracy of the order now will save time later.

4. Follow up by telephone to make sure your order was received and understood, and to confirm the delivery date and payment requirements.

Ordering Online

1. Ordering online requires a computer and a modem connection to the Internet or to an online service. Before ordering online, make sure you are fully familiar with the equipment and the process, or have your supervisor or the supply company’s sales representative oversee your initial orders.
2. Type your name and address accurately.
3. If pictures of supplies are not available online, consult the company’s printed catalog or CD-ROM catalog. If you do not have access to a catalog, read the online text descriptions carefully, checking trade names and specifications, to select the appropriate merchandise (Figure 8-21). If you have questions, call the supply company.
4. When you have completed the selections, the online service will display your order for you to confirm. Check that all the information is accurate, including your name, address, and telephone number.
5. If you have an account with the company, you may type in your account number to place the order. Otherwise, you may wish to arrange to make payment on delivery. If you prefer to pay by credit card, first make sure that the company is reputable and that it uses a security system that prevents your number from being read by anyone unauthorized to do so.

If, despite your best efforts, your order is processed incorrectly, take appropriate action immediately. Although ordering by telephone, by fax, or online is convenient, it still requires additional time to package items that must be returned.

By law, orders that you place must be fulfilled within a reasonable time. The Federal Trade Commission (FTC) monitors purchases by telephone, fax, and online services to protect consumers. The FTC requires supply companies to provide merchandise within 30 days or to give you the option of canceling the order and receiving a full refund.

FIGURE 8-21 Read online information just as carefully as you read a printed catalog.

The vendor's invoice usually describes payment terms. Two examples of payment terms are

- "Net 30": This means you have 30 days in which to pay the total amount.
- "1% 10 Days Net 30": This means that you will get a savings of 1% of the total price by paying within 10 days.

Copies of all bills and order forms for supplies should be kept on file for at least 7 years in case the practice is audited by the Internal Revenue Service (IRS).

Ordering Procedures

Ordering procedures for supplies vary from office to office but always involve these tasks: completing paperwork, checking orders received, correcting errors in shipments, and making payment.

Order Forms Before ordering merchandise, you should inquire about a vendor's ordering options, discuss them with the physician or practice manager, and determine which method is best for the office. Many vendors now have ordering capability through telephone, fax, e-mail, and online as well as traditional written order forms. Always be sure to keep a copy of each order you submit.

Before you place an order, gather all the necessary information, such as correct names of items, item numbers, and order and account numbers. This information helps to ensure the order's accuracy. Immediately after placing the order, note all order information on the inventory card or record page for that item.

Purchase Requisitions You will need to follow any special ordering procedures established in your medical office. The specific procedures and the medical assistant's level of authority vary from one office to another. Sometimes placing an order requires a **requisition** (a formal request from a staff member or doctor), which is given to the medical assistant who does the actual ordering. The physician's or practice manager's approval may be necessary for large purchases—for example, for orders that total more than \$300. Recurring orders may not require the doctor's approval, but you may need to get approval before ordering a new brand or quantities of a particular item over a certain amount.

In a group practice where physicians or licensed practitioners order different items and several staffers are in charge of ordering, procedures for ordering can be complicated. One common way to simplify matters is to use a **purchase order**—a form that authorizes a purchase for the practice. Figure 8-22 shows a sample purchase order. Purchase orders are usually preprinted with

consecutive numbers. The medical assistant submits approved purchase orders to the vendor for fulfillment. This method is most often used for expensive items, such as office equipment, but some large practices also use purchase orders for supplies.

Checking Orders Received When the shipment of supplies arrives, record on the inventory card or record page the date received and the quantity of each item. Check the shipment against the order form to make sure the correct items—in the correct sizes, styles, packaging, and quantity—have been delivered.

Then check the contents against the packing slip (a description of the package contents) enclosed in the package. This checking takes time, but catching even one error is worth the time taken. If several people on a staff have ordering responsibility, they can share the task. The employee should write on the package slip the date items were received; check off each item as you verify and initial.

Correcting Errors Any errors in a shipment should be reported immediately to the vendor so that the records can be corrected, missing supplies can be delivered, or incorrect supply orders can be canceled. When you call to report errors, be sure you have all the paperwork in front of you. You will need the invoice number, order date, name of the person who placed the order, name of the person who took the order, and a list of questions or a description of the problem. If a catalog

was used in ordering, have it open to the appropriate page. Always record the name and title of the person you speak with when reporting the error.

Invoices Typically, the vendor sends an invoice to the medical office, either accompanying the merchandise or separately. This invoice also should be checked carefully against the original order and the packing slip. It is a good idea to staple the order list, packing list, and a copy of the invoice together for the office records to verify all items were received. See Figure 8-23. Be sure to check the arithmetic, too. Then sign or stamp the invoice to confirm that the order was received. If an item you order is temporarily out of stock, the vendor usually sends an invoice stamped “Back Ordered.” Later, when the item is back in stock, the vendor will ship it to your office.

It is also a good habit to record the check number, date, and amount of payment on the invoice. You, the physician, or the practice manager may initial it. By keeping a copy of the paid invoice with the attached order slip and packing slip in the office records, it will be easy to track the items included within each invoice. This step makes verifying payments easier and decreases the chance of inadvertently paying an invoice twice.

Disbursements An invoice is paid with a **disbursement** (payment of funds) to a vendor. Disbursements may be made in cash or by business credit card, check, or money order.

FIGURE 8-23 Check the original order form, the packing slip, and the invoice to verify that all items ordered were received.

Usually, you will write a check to the vendor and have the authorized individual sign it. Be sure to provide the original order, packing slip, and invoice. On the front of the check, record the invoice number. Finally, mail the check to the vendor with the vendor's copy of the invoice. File the office copy of the invoice, along with the original order and the packing slip, according to your inventory filing system.

On the rare occasion you make a cash disbursement, obtain a receipt to keep on file. If you are the one responsible for maintaining the practice's financial records and presenting them to the accountant, you also may be responsible for recording the payment information in the office's accounting books.

Avoiding Common Purchasing Mistakes

Even the most watchful professional can make purchasing mistakes. The best you can do is to educate yourself about common mistakes and try to avoid them. For example, be aware of the possibility of dishonest telephone or e-mail solicitations. The solicitor may claim to be a sales representative for the manufacturer of the office photocopier, offering bargains on paper or toner. It is typical, when a scam is involved, that advance payments will be required and you are instructed to send payment to a PO box, instead of to a physical address. Once you do, it is likely that the bargain will never be shipped to your office.

The best way to deal with these solicitations is to tell the caller that your office does not purchase supplies by telephone. If a telephone offer appears to be legitimate and to offer substantial savings, ask for the name and telephone number of the firm so that you can return the call at a more convenient time. This will give you time to verify the number with the telephone company and check the firm's name with the Better Business Bureau. If the solicitation is by e-mail, do not reply to the e-mail, but contact the company via its own website or by phone to verify the information.

Another disreputable tactic some vendors use is bait and switch, meaning the price of one item is lowered to attract the customer, but that item is always "sold out" and the customer is encouraged to buy a more expensive one. A vendor may also mislead you by raising the price of an item you have been ordering without informing you. Always confirm the current price, check invoices as they come in, and record everything in the item's file. Having your inventory card or record page open while ordering will prompt you to notice and question price changes. If there is an honest error, a reputable firm will readily and courteously correct it.

Problems also can be avoided by carefully supervising a new vendor's sales representative until a comfortable, professional rapport has been established. Discuss your inventory system with representatives, and ask them questions about their procedures.

Procedure Goal: To correctly prepare and send a fax document, while following all HIPAA guidelines to guard patient confidentiality

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Fax machine, fax line, cover sheet with statement of disclaimer, area code and phone number of fax recipient, document to be faxed, telephone line, and telephone

Method:

1. Prepare a *cover sheet*, which provides information about the transmission. Cover sheets can vary in appearance but usually include the name, telephone number, and fax number of the sender and the receiver; the number of pages being transmitted; and the date of the transmission. Preprinted cover sheets also can be used.

RATIONALE: *The fax should clearly identify where it originated and to whom it is being sent. If another recipient receives the fax in error, he will know whom to notify regarding the error.*

2. All cover sheets must carry a disclaimer statement to guard the patient's privacy. A *disclaimer* is a statement of denial of legal liability. A disclaimer should be included on the cover sheet and may read something like this:

This fax contains confidential or proprietary information that may be legally privileged. It is intended only for the named recipient(s). If an addressing or transmission error has misdirected the fax, please notify the author by replying to this message. If you are not the named recipient, you are not authorized to use, disclose, distribute, copy, print, or rely on this fax and should immediately shred it.

RATIONALE: *This step helps guard the patient's privacy.*

3. Place all pages of the document, including the cover sheet, either facedown or faceup in the fax machine's sending tray, depending on the directions stamped on the sending tray.

4. If the pages are placed facedown, write the area code and fax number on the back of the last page.

5. Dial the receiving fax machine's telephone number using either the telephone attached to the fax machine or the numbers on the fax keyboard. Include the area code for long-distance calls.

6. When using a fax telephone, listen for a high-pitched tone. Then press the "Send" or "Start" button and hang up the telephone. This step completes the call circuit in older-model fax machines. Your fax is now being sent. Newer fax machines do not require this step.

RATIONALE: *This step completes the call circuit in older-model fax machines.*

7. If you use the fax keyboard, press the "Send" or "Start" button after dialing the telephone number. This button will start the call.

8. Watch for the fax machine to make a connection. Often a green light appears as the document feeds through the machine.

9. If the fax machine is not able to make a connection, as when the receiving fax line is busy, it may have a feature that automatically redials the number every few minutes for a specified number of attempts.

10. When a fax has been successfully sent, most fax machines print a confirmation message. When a fax has not been sent, the machine either prints an error message or indicates on the screen that the transmission was unsuccessful.

RATIONALE: *This message confirms to the sender that the fax has been sent or indicates that the fax needs to be sent again.*

11. Attach the confirmation or error message to the documents faxed. File appropriately.

RATIONALE: *This step ensures thorough documentation related to the fax.*

12. If required by office policy, the sender should call the recipient to confirm the fax was received.

PROCEDURE 8-2 Using a Photocopier Machine

Procedure Goal: To produce copies of documents

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Copier machine, copy paper, and documents to be copied

Method:

1. Make sure the machine is turned on and warmed up. It will display a signal when it is ready for copying.
2. Assemble and prepare your materials, removing paper clips, staples, and self-adhesive flags.

RATIONALE: *This step helps avoid loose items getting caught in the copier and provides for optimum efficiency.*

3. Place the document to be copied in the automatic feeder tray as directed, or upside-down directly on the glass. The feeder tray can accommodate many pages; you may place only one page at a time on the glass. Automatic feeding is a faster process, and you should use it when you wish to collate or staple packets. Page-by-page copying is best if you need to copy a single sheet or to enlarge or reduce the image. To use any special features, such as making double-sided copies

or stapling the copies, press a designated button on the machine.

4. Set the machine for the desired paper size.

RATIONALE: *The copier will select the paper size automatically if the size is not selected. This could result in a waste of paper.*

5. Key in the number of copies you want to make and press the “Start” button. The copies are made automatically.

6. Press the “Clear” or “Reset” button when your job is finished.

RATIONALE: *The machine is now ready for the next user and will not perform unwanted functions on the next document.*

7. If the copier becomes jammed, follow the directions on the machine to locate the problem (for example, there may be multiple pieces of paper stuck inside the printer) and dislodge the jammed paper. Most copy machines will show a diagram of the printer and the location of the problem.

PROCEDURE 8-3 Using a Postage Meter

Procedure Goal: To correctly apply postage to an envelope or package for mailing, according to US Postal Service guidelines

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Postage meter, addressed envelope or package, and postal scale

Method:

1. Check that there is postage available in the postage meter.

RATIONALE: *For the postage meter to function, there must be money in your postal account. Contact the company that manages your account or your local post office for more information.*

2. Verify the day’s date.

RATIONALE: *US Postal Service guidelines prohibit mailing envelopes and packages that are postmarked with an incorrect date.*

3. Check that the postage meter is plugged in and switched on before you proceed.

4. Locate the area where the meter registers the date. Many machines have a lid that can be flipped up, with rows of numbers underneath. Months are represented numerically, with the number “1” indicating the month of January, “2” indicating February, and so on. Check that the date is correct. If it is incorrect, change the numbers to the correct date.

5. Make sure all materials have been included in the envelope or package. Weigh the envelope or package on a postal scale. Standard business envelopes weighing up to 1 oz require the minimum postage (the equivalent of

one first-class stamp). Oversize envelopes and packages require additional postage. A postal scale will indicate the required postage.

6. Key in the postage amount on the meter and press the button that enters the amount. For amounts over \$1, press the “\$” sign or the “Enter” button twice.

RATIONALE: *This feature verifies large amounts, catching errors in case you mistakenly press too many keys.*

7. Check that the amount you typed is the correct amount. Envelopes and packages with too little postage will be returned by the US Postal Service. Sending an envelope or package with too much postage is wasteful to the practice.
8. While applying postage to an envelope, hold it flat and right side up (in order to read the address). Seal the envelope (unless the meter seals it for you). Locate the plate or area where the envelope slides through. This feature is usually near the bottom of the meter. Place the envelope on the left side and give it a gentle push toward the right. Some models hold the envelope in a stationary position. (If the meter seals the envelope for you, it is especially important that you insert it correctly to allow for sealing.) The meter will grab the envelope and pull it through quickly.
9. For packages, create a postage label to affix to the package. Follow the same procedure for a label as for an envelope. Affix the postmarked label on the package in the upper-right corner.
10. Check that the printed postmark has the correct date and amount and that everything written or stamped on the envelope or package is legible.

PROCEDURE 8-4 Using a Check-Writing Machine

Procedure Goal: To produce a check using a check-writing machine

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Check-writing machine, blank checks, office check-book, or accounting system

Method:

1. Assemble all equipment.
2. Turn on the check-writing machine.
3. Place a blank check or a sheet of blank checks into the machine.
4. Key in the date, the payee’s name, and the payment amount. The check-writing machine imprints the check

with this information, perforating it with the payee's name. The perforations are little holes in the paper that prevent anyone from changing the name on the check.

5. Turn off the check-writing machine.
6. A doctor or another authorized person then signs the check.

RATIONALE: *The check is not valid without the proper signature.*

7. To complete the process, record the check in the office checkbook or accounting system.

RATIONALE: *To maintain accurate records, all financial transactions must be promptly and accurately recorded.*

PROCEDURE 8-5 Step-by-Step Overview of Inventory Procedures

Procedure Goal: To set up an effective inventory program for a medical office

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Pen, paper, file folders, vendor catalogs, index cards or loose-leaf binder and blank pages, reorder reminder cards, and vendor order forms

Method:

1. Discuss and define with your physician/employer the extent of your responsibility in managing supplies. Know whether the physician's approval or supervision is required for certain procedures, whether any systems have already been established, and if the physician has any preference for a particular vendor or trade-name item. If your medical practice is large, determine which medical assistant is responsible for each aspect of supply management.
2. Know what administrative and clinical supplies should be stocked in your office. Create a formal supply list of vital, incidental, and periodic items and keep a copy in the office's procedures manual.
3. Start a file containing a list of current vendors with copies of their catalogs.
4. Create a wish list of brands or products the office does not currently use but might like to try. Inform other staff members of the list so that they can make entries.
5. Make a file for supply invoices and completed order forms. (Keep these documents on file for at least 3 years.)
RATIONALE: *Keep completed documents for future reference as well as for legal protection, if needed.*
6. Devise an inventory system of index cards, loose-leaf pages, or a computer spreadsheet for each item. List the following data for each item on its card:
 - Date and quantity of each order
 - Name and contact information for the vendor and sales representative
 - Date each shipment was received
 - Total cost and unit cost, or price per piece for the item
 - Payment method used
 - Results of periodic counts of the item
 - Quantity expected to cover the office for a given period of time

- Reorder quantity (the quantity remaining on the shelf that indicates when reorder should be made)

7. Have a system for flagging items that need to be ordered and those that are already on order. For example, mark their cards or pages with a self-adhesive tab or note. Make or buy reorder reminder cards to put into the stock of each item at the reorder quantity level.

RATIONALE: *Having a system in place makes your job easier and will make it easier for anyone else taking over the task at a later date.*

8. Establish with the physician a regular inventory-taking schedule. Every 1 to 2 weeks is usually sufficient. As a backup system for remembering to check stock and reorder, estimate the times for these activities. Mark them on your calendar or create a tickler file on your computer.

RATIONALE: *A regular schedule means inventory and ordering will not be forgotten.*

9. Order at the same times each week or month, after inventory is taken. However, if there is an unexpected shortage of an item and more than a week or so remains before the regular ordering time, place the order immediately.
10. Fill in the vendor's order form (or type a letter of request). Order by telephone, by fax, by e-mail, or online. Online ordering will expedite the order. Follow procedures that have been approved by the physician or office manager. When placing an order, have all the necessary information at hand, including the correct name of the item and the order and account numbers. Record the order information in the inventory file for that item. Be sure to obtain from the vendor an estimated arrival time for the order and mark that date and order number on your calendar.
11. When ordering online, save the website to "Favorites" for easy, one-click future access. Select the website and establish an account with the company. To establish an account, you will need to give information about your office practice, including the name of the practice, the contact name, the address, the phone number, an e-mail address, and a payment source. Ask about adding the practice to any special contact lists for promotional materials and discounts.
12. When you receive the shipment, record the date and the amount received on the item's inventory card or record page. Check the shipment against the original order and

the packing slip inside the package to ensure that the right items, sizes, styles, packaging, and amounts have arrived. Initial each item on the packing slip as a record that the correct item and amount were received. If there is any error, immediately call or e-mail the vendor, with the catalog page and the inventory card or record page at hand.

RATIONALE: *Items should be unpacked and checked immediately so that if a problem is discovered, it will be relatively easy to prove that the error or problem is with the shipment and not caused by office personnel.*

13. Check the invoice carefully against the original order and the packing slip, making sure that the amount of the bill matches the items listed on the invoice and the packing list, and ensure that the bill has not already been paid. Sign or stamp the invoice to show that the order was received.

14. Write a check to the vendor to be signed by the physician. (Check-writing procedures are described in the *Patient Collections and Financial Management* chapter.) Be sure to show the physician the original order, packing slip, and invoice. Record the check number, date, and amount of payment on the invoice and initial it or have the physician do so. Write the invoice number on the front of the check.

RATIONALE: *Writing the invoice number on the check will ensure that the payment is posted to the correct account. Writing the check number and date on the invoice will be useful for future reference if there is a payment dispute.*

15. Mail the check and the vendor's copy of the invoice to the vendor within 30 days and file the office copy of the invoice with the original order and packing slip.

S U M M A R Y O F L E A R N I N G O U T C O M E S	
LEARNING OUTCOMES	KEY POINTS
8.1 Identify common types of computers.	Common types of computers include desktop computers, laptops, notebooks, subnotebooks, tablets, PDAs, and some types of cell phones.
8.2 Describe computer hardware components and explain the functions of each.	Computer hardware components include the monitor, which allows information contained in the system to be seen; the keyboard, which allows for inputting of information; and the printer, which produces hard copies of information.
8.3 Describe the types of software applications commonly used in the medical office.	Software components include both the operating system that controls the computer and applications that run on the operating system. Software applications commonly used in the medical office include operating system software such as Microsoft Windows and Linux. Application software commonly used in medical offices includes word processing, database management, spreadsheets, practice management, electronic transfer, scheduling, and desktop publishing.
8.4 Summarize the options available for learning computer software programs.	Options available for learning computer software programs include classes, tutorials, manuals, documentation, and online learning with online software "Help" features.
8.5 Recall the steps involved in selecting new or upgrading existing office computer equipment.	Learn as much as you can about the hardware and software being considered. Consider the office needs now and in the future. What is the existing hardware and/or software capable of and can it meet the needs now and in the future? Will an upgrade suffice, or will new equipment or software save the office money in the long run? These are the most important considerations.
8.6 Outline the basic care and maintenance required for the office computer system.	The system unit should be placed in a well-ventilated location and a power strip with a surge protector should be used to protect the circuitry. Use screen savers and power-down capabilities when the system is not in use. Protect storage devices with appropriate covers when not in use. Never eat or drink near computers. Follow maintenance directions provided with all equipment.

LEARNING OUTCOMES	KEY POINTS
8.7 Identify several reasons security is particularly important in the computerized office.	Great care must be taken to safeguard confidential files, make backup copies on a regular basis, and prevent system contamination. HIPAA laws require that privacy and security procedures are in place to prevent the misuse of health information. These procedures also must ensure confidentiality.
8.8 Explain the function of other types of administrative medical office equipment.	Other administrative medical office equipment includes faxes to send information; photocopiers to copy information; typewriters, adding machines, and calculators to perform business functions; folding/inserting machines and postage meters to efficiently prepare mail; dictation-transcription machines for clear medical records; check writers to assist with accounts payable; and paper shredders for confidentiality.
8.9 Outline the steps to be taken in deciding whether new office equipment is needed.	The first step in evaluating the equipment needs of a healthcare office is the research process. Consider office needs and ask about advantages of new equipment versus existing equipment, comparing the benefits of each. Compare products, features, and prices, calling the suppliers for more information as needed. Do not forget to review the warranties.
8.10 Explain the difference between a maintenance contract and a service contract.	A maintenance contract specifies when the equipment will be cleaned, checked for worn parts, and repaired. A standard maintenance contract may include regular checkups as well as emergency repairs. A service contract may cover emergency repairs not covered under standard maintenance.
8.11 Define vital, periodic, and incidental supplies.	Vital supplies are items that are absolutely essential for the practice's functioning. Incidental supplies are needed in the office but do not threaten the office's efficiency if the supply runs low. Periodic supplies are those supplies that require ordering only occasionally, like appointment books.
8.12 Outline the steps in performing a supply inventory.	Review Procedure 8-5 for an outline on performing a supply inventory.
8.13 List the items that should be considered when choosing a vendor for supply ordering.	Obtaining recommendations from other medical offices is a good way to locate reputable office-supply dealers who sell items at reasonable prices. Reputable vendors fulfill orders accurately with quality items, deliver products in good condition, and charge fair prices. Compare vendors on price, quality, timeliness, and how they handle customer problems and complaints.

CASE STUDY CRITICAL THINKING

© Karen Moskowitz/Getty Images

Recall Miguel from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding his case.

1. Why is it important that Miguel keep track of the usage of the various types of administrative equipment and supplies used by BWW Medical Associates?
2. Why is it important for Miguel to stay current with communications coming into the office via fax and e-mail?
3. Miguel has a reminder on his calendar to order paper and administrative supplies on the 15th of the month. Will he be ordering all the supplies on the inventory list? Why or why not?
4. If Miguel does not order all the supplies, how will he know which ones should be ordered?

EXAM PREPARATION QUESTIONS

- (LO 8.2) Which of the following items is *not* a pointing device?
 - Mouse
 - Trackball
 - Touch pad
 - Touch screen
 - Keyboard
- (LO 8.1) Which of the following are considered personal computers?
 - Desktops
 - Laptops
 - PDAs
 - All of these
 - None of these
- (LO 8.2) Which of the following is the smallest (in physical size) storage drive?
 - Zip drive
 - Jump drive
 - CD-ROM
 - DVD-ROM
 - Diskette
- (LO 8.3) Which software program would be most helpful if you wanted to produce a report on your patients with a family history of breast cancer?
 - Database management
 - Spreadsheet
 - Communication
 - Appointment scheduling
 - Word processing
- (LO 8.2) Many copiers are now capable of multiple tasks. Which of the following is *not* one of those tasks?
 - Copying
 - Faxing
 - Calculations
 - Scanning
 - Collating
- (LO 8.8) Which of the following is a financial reason for considering a postage meter?
 - It saves on trips to the post office
 - It cuts down on the different types of stamps needed in the office
 - Calculating postage for larger articles, including packages, is easier
 - It saves money by calculating and printing the exact postage needed
 - All of these
- (LO 8.8) What is the most important reason to have paper-shredding capabilities for the medical office?
 - Decreases waste by cutting paper into small strips
 - Destroys “mistakes” made in a medical record
 - Destroys unneeded documents containing PHI
 - Increases readily available packing material
 - Destroys records of patients who leave the practice
- (LO 8.11) When managing office supplies, the goal is to achieve
 - Efficiency
 - Organization
 - Resourcefulness
 - Independence
 - All of these
- (LO 8.11) Expendable items are those that are
 - Able to be thrown away
 - Used and must be restocked
 - Used indefinitely
 - Restored and reused
 - Vital to the running of the office
- (LO 8.11) Examples of clinical supplies are
 - Needles, syringes, and lubricating jelly
 - Paper cups and toilet tissue
 - Rubber bands, stamps, and file folders
 - Patient education materials and insurance forms
 - Paper drapes and HIPAA forms

CASE STUDY

PATIENT INFORMATION	Patient Name	DOB	Allergies
	Shenya Jones	11/3/19XX	Peanuts and cinnamon
PATIENT INFORMATION	Attending	MRN	Other Information
	Elizabeth H. Williams, MD	124-86-564	CA-MRSA. Patient information brochure given to patient.

Shenya Jones, 34-year-old female, arrives at the office with swelling and a red pustule on her face. She states that the problem started 2 days ago as a small pimple near her nose. It became irritated, and then extremely swollen and painful overnight. This morning, she noticed yellow drainage at the lesion site and the swelling has increased. The area of

© McGraw-Hill Education

drainage is approximately 1 cm in diameter. Her upper lip, side of the face, and nose are all swollen. The examination and treatment areas need to be prepared before you bring her to the back office.

Keep Shenya in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

 **ACTIVSim**

LEARNING OUTCOMES

After completing Chapter 9, you will be able to:

- 9.1** Describe the layout and features of a typical examination room.
- 9.2** Differentiate between sanitization and disinfection.
- 9.3** List steps to prevent the spread of infection in the exam and treatment rooms.
- 9.4** Describe the importance of temperature, lighting, and ventilation in the exam room.
- 9.5** Identify instruments and supplies used in a general physical exam and tell how to arrange and prepare them.

KEY TERMS

- | | |
|------------------------------------|---------------|
| accessibility | lubricant |
| ADA Amendments Act of 2008 (ADAAA) | occult blood |
| consumable | sanitization |
| disinfection | spores |
| fixative | sterilization |
| general physical examination | |

- III.C.4** Identify methods of controlling the growth of microorganisms
- III.P.10** Demonstrate proper disposal of biohazardous material
 - (a) sharps
 - (b) regulated wastes
- X.C.10** Identify:
 - (c) Americans with Disabilities Act Amendments Act (ADAAA)
- XII.P.5** Evaluate the work environment to identify unsafe working conditions

9. Clinical Procedures

- a. Practice standard precautions and perform disinfection/sterilization techniques

10. Medical Laboratory Procedures

- c. Dispose of biohazardous materials

Introduction

The care and maintenance of the medical office's examination and treatment areas are duties of the medical assistant. Preventing accidents by following physical safety guidelines discussed in the *Safety and Patient Reception* chapter are just the beginning of such duties. The medical assistant must perform specific tasks to prepare and maintain the rooms, equipment, and supplies. These tasks include knowing the equipment and supplies and practicing infection control at all times.

The Exam Room

LO 9.1

The exam room is the area where the physician observes the patient, listens to the patient's description of symptoms, performs a general physical exam, and dispenses treatment. A physician performs a **general physical examination** to confirm a patient's health or diagnose a medical problem. Figure 9-1 shows a typical exam room.

Number and Size of Rooms

The number of exam rooms in a medical office depends on the number of healthcare practitioners who work there and on each practitioner's patient load. Ideally, each practitioner in a medical office has at least two exam rooms for her or his exclusive use. A minimum of two rooms per practitioner

enables the medical assistant to prepare one room while the practitioner examines a patient in the other room.

The customary size for an exam room is 8 × 12 feet—large enough to accommodate the practitioner, the patient, and one assistant comfortably yet small enough that instruments and supplies will be within easy reach. Doors and interior walls should be soundproofed to ensure privacy for patients. Some exam rooms have dressing cubicles in one corner, while others have screens behind which the patient may disrobe. Regardless of a room's layout, you should provide privacy for patients whenever they need to disrobe and put on gowns.

A rack for the patient's medical records may hang on the wall directly outside the exam room or on the outside of the door. As offices transition to electronic health records, many rooms now have computer stations. A light or other device like colored tabs on the wall or door may be used to signal that the room is occupied.

Furnishings

Furnishings should be arranged for efficiency, physician convenience, and patient comfort. The examining table is the exam room's key piece of equipment and should be positioned in the center of the room or extending out from the wall. This arrangement allows the physician and an assistant to attend to the patient on at least three sides. The examining table usually contains a pullout step for the patient to use when getting onto the table. It also may contain drawers for storing instruments and table coverings. Examining tables are usually adjustable to enable the patient to assume the various positions the physical exam may require. The physician will probably tell you beforehand if you need to adjust the table in a particular way. Most exam rooms also have a sink, a countertop, and a writing surface large enough to spread out the patient's records or access to a computer and electronic health records. Shelves, cupboards, and drawers store routine supplies like dressings, adhesive tape, and bandages. The exam room also may include the following items:

- One or more chairs for the patient and family member
- A rolling stool for the physician
- A weight scale with height bar (there may not be a scale in every room)
- A metal wastebasket with a lid

FIGURE 9-1 You are responsible for making sure the exam room is clean and orderly.

© Mark Harmel/Getty Images

- Biohazardous waste containers for disposal of biohazardous materials (biological agents that can spread disease to living things)
- Puncture-proof containers for disposal of biohazardous sharps
- A high-intensity lamp
- Wall brackets for hanging instruments such as a blood pressure cuff

Special Features

The Americans with Disabilities Act of 1990 (ADA) requires that businesses, services, and public transportation provide “reasonable accommodations” for individuals with disabilities. To comply with this act, at least one exam room in a medical office must have features that make the area accessible to patients who use wheelchairs or who have visual or other types of physical impairments. **Accessibility** refers to the ease with which people can move in and out of a space.

The ADA accessibility guidelines require the following:

- A doorway at least 36 inches (915 mm) wide to allow a person in a wheelchair to pass through
- A clearance space in rooms and hallways that is 60 inches (1525 mm) in diameter to allow a person in a wheelchair to make a 180-degree turn
- Stable, firm, slip-resistant flooring
- Door-opening hardware that can be grasped with one hand and does not require the twisting of the wrist to use
- Door closers adjusted to allow time for a person in a wheelchair to enter or exit through the door
- Grab bars in the lavatory

In 2008, an amendment to the ADA, the **ADA Amendments Act of 2008 (ADAAA)**, was enacted. This amendment broadens the definition of disability, making it easier for individuals who seek ADA protection to establish that they have a disability. Broadening the definition of disability made it easier for individuals with impairments or disabilities such as cancer, diabetes, and epilepsy to prove their disability and seek the protection of the ADA. Congress adopted a set of “rules of construction” to use when determining if an individual is “substantially limited.” These rules include the following:

- The term *substantially limits* requires a lower degree of functional limitation than the previous standard
- The term *substantially limits* must be construed broadly
- Determining an individual’s disability should not require extensive analysis
- An impairment that is episodic or in remission is considered a disability if its return would substantially limit a major life activity

▶ Sanitization and Disinfection LO 9.2

Examination and treatment areas must be kept clean to control pathogens and to prevent the spread of infection. As discussed in the chapter *Infection Control Fundamentals*, we must apply the principles of asepsis to break the chain of infection. Two

techniques used on equipment and surfaces that help maintain asepsis are sanitization and disinfection. Sanitization and disinfection are both cleaning processes that reduce pathogens. In general, sanitization is the physical act of cleaning; disinfection is the destruction of most pathogens.

Sanitization

Sanitization is the scrubbing of instruments and equipment with special brushes and detergent to remove blood, mucus, and other contaminants or media where pathogens can grow. Sanitization is used to clean items that touch only healthy, intact skin. For other equipment, sanitization is the first step before disinfection and sterilization. Examples of instruments and equipment that you can sanitize and reuse without further disinfection or sterilization include the following:

- Blood pressure cuff
- Ophthalmoscope (an instrument containing a mirror and lenses used to examine the interior of the eye)
- Otoscope (an instrument used for inspecting the ear)
- Penlight
- Reflex hammer
- Stethoscope
- Tape measure
- Tuning fork

Collecting Instruments for Sanitization Sanitize instruments as soon as possible after use. If you cannot sanitize them immediately, place them in a sink or container filled with water and a neutral-pH detergent solution so that blood and tissue will not dry on the instrument.

In a surgical setting, use a special receptacle of disinfectant solution for collecting contaminated instruments. In an examination setting, place instruments in a sink or a covered container that can be transported to a sink. Take care when placing instruments in sinks or basins, as you can damage pieces of equipment if you drop them carelessly into a receptacle. Nicks or scratches can affect their function and can provide opportunities for bacterial contamination.

When you are ready to begin the sanitization procedure, put on properly fitting, intact utility gloves. They are the barrier between your skin and any infectious material on the instruments and equipment to be cleaned. When you work with instruments that may be contaminated with blood, body fluids, or tissue, you may want the additional protection of a mask, eye protection, or protective clothing.

Separate the sharp instruments from all other equipment (Figure 9-2). This reduces the risk of blunting sharp edges or points, damaging other equipment, and injuring yourself.

Scrubbing Instruments and Equipment Begin by draining the disinfectant or detergent solution in which the equipment was soaking. Rinse each piece of equipment in hot, running water and handle only one item at a time (by its handles where applicable). Scrub each item using hot, soapy water and a small plastic scrub brush. Never use metal brushes or steel wool, which can scratch and damage instruments. Pay

FIGURE 9-2 When working with instruments and equipment, separate pointed or sharp-edged instruments from all others.

© Cliff Moore

careful attention to hinges, ratchets, and other nooks and crannies where contaminated material may collect (Figure 9-3). Use different-sized brushes to clean all areas of each item, along with a low-sudsing, neutral-pH detergent specially formulated to dissolve blood and blood products for medical instruments and equipment. Equipment and instrument manufacturers provide guidelines for sanitizing various types of products. For example, stainless steel items must be sanitized differently than chrome-plated instruments. Follow manufacturers' guidelines when working with their products.

After scrubbing all surfaces and removing all visible stains and residue, rinse instruments individually and place each one on a clean towel. Roll the instrument in the towel to remove moisture, dry it thoroughly, and examine it closely to be sure it is operating correctly. Check that all moving parts operate smoothly and that surfaces are free from nicks, scratches, and other imperfections. Instruments that need only to be sanitized can be returned to trays or bins for storage. Wrap items that require disinfection and **sterilization** (complete destruction of

all living organisms) in a clean covering and set them aside for those processes. The process of sterilization is discussed in the chapter *Assisting with Minor Surgery*.

Rubber and Plastic Products To sanitize rubber and plastic products, you may need to soak them only for a short period or not at all. Be sure to follow manufacturers' guidelines, as some rubber and plastic products fade or discolor if left in a detergent solution.

Ultrasonic Cleaning Delicate instruments and those with moving parts should be sanitized using ultrasonic cleaners. Ultrasonic cleaning involves placing instruments in a special bath. The cleaner generates sound waves through a cleaning solution, loosening contaminants. Ultrasonic cleaning is safe for even very fragile instruments. Follow the manufacturer's guidelines and Procedure 9-1, Performing Sanitization with an Ultrasonic Cleaner, at the end of this chapter, when performing ultrasonic cleaning.

Disinfection

Sanitization is often only the beginning of the microorganism elimination process. After sanitization, some instruments and equipment require only disinfection before being used again. Disinfection of other items, however, is merely the second step in infection control, performed before the sterilization process.

Disinfection is a process that destroys most, but not all, microorganisms. Bacterial **spores** (thick-walled, reproductive bodies capable of resisting harsh conditions) and certain viruses have been known to survive disinfection with strong chemicals and boiling water. It is essential to understand this limitation of disinfection when you work with instruments and equipment. To destroy microorganisms, a disinfectant solution must reach every surface of an instrument. You must wear gloves when handling instruments during disinfection procedures, because instruments requiring disinfection are considered to be contaminated.

Disinfection is usually sufficient for instruments that do not penetrate a patient's skin or that come in contact only with a patient's mucous membranes or other surfaces not considered sterile. Instruments and equipment that you can disinfect and reuse without sterilization include the following:

- Enamelware
- Endotracheal tubes (tubes used to establish an artificial airway through the nose, mouth, or direct tracheal route)
- Glassware
- Laryngoscopes (tubes equipped with lighting used to examine the interior of the larynx through the mouth)
- Nasal specula (instruments used to enlarge the opening of the nose to permit viewing)

Note that you must sterilize any instrument or piece of equipment before another use, including those just listed, if there is visible contamination with blood or blood products, even if disinfection is commonly considered sufficient. Sterilization is the only reliable measure you can take to eliminate bloodborne pathogens.

FIGURE 9-3 Clean all areas of an instrument, using a brush for hard-to-reach surfaces.

© McGraw-Hill Education. David Moyer, photographer

Using Disinfectants Disinfectants are cleaning products—used primarily on inanimate materials—applied to instruments and equipment to reduce or eliminate infectious organisms. In contrast, cleaning products used on human tissues as anti-infection agents are called *antiseptics*.

There are no clear visual indications that an item has been properly and completely disinfected. To ensure the optimum effectiveness of disinfectants, follow manufacturers' guidelines carefully when using them. Other factors also may have an impact on a disinfectant's effectiveness. For example, if the disinfectant solution has been used many times, it may not be as powerful as a fresh solution. When wet items are put in the disinfectant bath, the surface moisture may dilute the solution. Traces of the soap used in the sanitization process can alter the chemical makeup of the disinfectant, making it nonlethal to pathogens. Evaporation also can alter the solution's chemical makeup.

Choosing the Correct Disinfectant Manufacturers' guidelines are the most accurate and up-to-date sources of

information about the type of disinfectant to use on a given product. Generally, disinfect instruments and equipment by using one or more of the following agents:

- Germicidal soap products
- Alcohol
- Chlorine and chlorine products
- Formaldehyde
- Glutaraldehyde
- Hydrogen peroxide
- Iodine and iodine compounds
- Acid products

Each of these disinfectants has advantages and disadvantages. Before using any disinfectant product or procedure, it is important to understand some general guidelines about disinfectant use as well as specific concerns with each approach. Review Table 9-1 for more details about example disinfectants. Keep in mind that guidelines for the selection and use of disinfectants

TABLE 9-1 Disinfectants

Product	Description	Example Uses	Advantages/Disadvantages
Germicidal soap products	The germ-killing additive may increase effectiveness.	Items that do not come in contact with a patient's mucous membranes	The scrubbing and rinsing steps are most important.
Alcohol (70% isopropyl)	Used to clean instruments and equipment that would be damaged by immersion in soap and water or other disinfectant solutions	• Oral and rectal thermometers • Scissors • Stethoscopes	Corrosive product that can cause damage to instruments with long-term use and to skin when used excessively
Chlorine and chlorine compounds (bleach)	Effective in a 10% bleach solution	• Used to disinfect surfaces and soak rubber equipment before sanitization • Decontamination of blood spills	Ventilation may be necessary because the fumes should not be inhaled for a prolonged period.
Formaldehyde	• Used as a preservative in a 10% solution • Used as a germicidal and sporicidal agent in a 5% solution • Must be used at room temperature because its effectiveness is reduced in cooler environments	• Preservation of anatomic specimens • Sterilization of surgical instruments	• Irritating fumes and pungent odor • Corrosive and an irritant to body tissue • Rinse clean items thoroughly with distilled or sterile water before using on patients.
Glutaraldehyde (Cidex®, Cidex Plus®, and Glutarex®)	• Used in chemical sterilization processes and as a high-level disinfectant • Immersing instruments or equipment in a bath of glutaraldehyde for 10 to 30 minutes is sufficient for disinfection	Respiratory therapy and spirometry equipment	Any chemical used in this "cold disinfection" method must be rated as a sterilant and registered with the EPA.
Hydrogen peroxide	Available in a 3% solution	• Soft contact lenses • Spot-disinfection of fabrics	Must be stored in a dark container
Iodine and iodine compounds	• 2% or greater solutions used as disinfectants • Weaker than 2% solutions used as antiseptics	• Skin antiseptic • Disinfection of blood culture bottles	• Somewhat corrosive • Effectiveness is limited by the presence of blood products, mucus, or soap.
Acid products	Includes phenol (carbolic acid)	• Laboratory surfaces • Used as pre-cleaner before sterilization	Extremely corrosive and toxic to tissue and should be used with care

can change and that some products may have become available since this writing. Review new products carefully to be sure they are approved by the Food and Drug Administration (FDA) and the Environmental Protection Agency (EPA).

Handling Disinfected Supplies After disinfecting equipment, handle it with care to prevent contaminating any surface that may later come in contact with a patient. Use sterile transfer forceps, or sterilizing forceps, to remove items from whatever disinfection unit is used. Always wear gloves to handle disinfected items and make sure you store disinfected equipment in a clean, moisture-free environment.

▶ **Preparation of the Exam and Treatment Areas** LO 9.3

A medical assistant must maintain the examination and treatment areas. The treatment room is basically an exam room that includes additional equipment and supplies and is used for procedures like suturing a wound or excising an abscess. Medical offices may or may not have a special treatment room. All areas of the medical office should be clean and well organized. A clean exam and treatment area is extremely important in preventing the spread of infectious diseases to patients and healthcare workers.

Infection Control

People with a variety of contagious diseases visit medical offices every day. The potential for the spread of infection is thus higher in medical offices than in most other places. For that reason, you must be especially careful to follow infection control procedures at work. You can safeguard the health of staff members and patients by

- Making hand hygiene a priority.
- Keeping the examining table clean.
- Disinfecting all work surfaces.

Hand Hygiene Clean hands are the first step in preventing infection transmission in the exam room and treatment area. Follow the steps for aseptic handwashing and the use of alcohol-based hand cleaners as outlined in the procedures in the *Infection Control Fundamentals* chapter. Review Table 9-2 for hand hygiene guidelines. After performing hand hygiene, use a clean paper towel to handle faucets or doorknobs to help you avoid contaminating your clean hands with microorganisms.

Examining Table The disposable paper that covers the examining table provides a barrier to infection during an exam. Always change the covering after each use (Figure 9-4). Your office might use precut lengths, or you might need to tear off a piece from a roll of paper.

Cover pillows with fresh paper. Also, provide tissues or special wipes for patients who need to wipe away excess

TABLE 9-2 Hand Hygiene
Recommended Practices
• Wash your hands at the beginning of the workday. • Wash your hands with soap and water whenever they are visibly contaminated with blood or other body fluids. • If your hands are not visibly contaminated, you should use an alcohol-based hand rub. • Wash your hands at the end of the workday before leaving the facility.
Indications for Hand Hygiene
• Before putting on and after removing gloves • Between patient contacts • Between different procedures on the same patient • After touching blood, other body fluids, secretions, excretions, and contaminated objects • After restroom visits, eating, combing hair, handling money, and any other time hands get contaminated • After contact with a patient's skin • After contact with wound dressings (bandages) • After contact with inanimate objects near a patient • Before eating, applying cosmetics, or manipulating contact lenses • Before and after handling clean or sterile supplies • After blowing your nose, sneezing, or coughing • After touching soiled items such as exam table coverings or clothing

FIGURE 9-4 When you remove the cover from the examining table, roll it up tightly and quickly. Then dispose of it immediately.
© McGraw-Hill Education. David Moyer, photographer

lubricant (a water-soluble gel used during an exam of the rectum or vaginal cavity) after certain procedures.

When you remove the used covering from the examining table, roll it up quickly and carefully with the contaminated side on the inside. You should have a small, tight bundle of paper when you finish. Crumpling the paper haphazardly or shaking it in the air stirs up dust and microorganisms and can spread infection.

Dispose of used paper coverings soiled by body fluids, especially blood, in a biohazardous waste container. (Refer to the *Infection Control Fundamentals* chapter for specific guidelines for disposing of hazardous items.) Used coverings with no visible fluids may be disposed of according to the procedures established by your office. Place soiled linen cloths and pillowcases in biohazard-labeled bags to be sent to a laundry for cleaning.

Surfaces You are responsible for disinfecting work surfaces in the exam room, including the examining table, sink, and countertop. As discussed earlier, disinfection involves exposing all parts of a surface to a disinfectant like a 10% solution of household bleach in water or a product approved by the EPA. The EPA's mission is to protect human health and the environment. See *Points on Practice* for more information about mixing bleach solutions.

Surfaces must be disinfected at the following times:

- After an exam or a treatment during which surfaces have become visibly contaminated with tissue, blood, or other body fluids
- Immediately following accidental blood or other body fluid spills or splatter
- At the end of your work shift

Routinely clean and disinfect the patient lavatory toilet and sink, and inspect and disinfect reusable receptacles like wastebaskets. In most offices, these tasks are performed

POINTS ON PRACTICE

Mixing a 10% Bleach Solution

Bleach solutions are the most commonly used disinfectant in the medical office. Hard surfaces, such as countertops and floors, and softer surfaces, such as exam beds and chairs are all disinfected using 10% bleach solutions. Bleach, when mixed and handled appropriately, is known to kill or inactivate many of the most common bacteria, viruses, and fungi, including HIV, influenza A, *E. coli*, staphylococci, and candida.

In order for bleach solutions to be effective, they must be mixed at the correct concentrations. They also must be mixed fresh every day. If you have bleach solution left over at the end of the day, discard the solution and mix a fresh batch the next morning. Mixing bleach solutions is inexpensive and simple.

Mix in a Well-Ventilated Area

To make 100 mL of a 10% bleach solution, use a graduated measuring device, such as a beaker, and carefully measure

10 mL bleach (5.25–6.15% household bleach with no fragrance added)

90 mL water (tap or distilled water)

Pour the bleach directly into a spray bottle. Add the water and place the lid tightly back on the spray bottle. Gently swirl to mix the contents, being careful not to spill.

once a day. Follow the schedule established by your office. Procedure 9-2 at the end of this chapter describes how to disinfect work surfaces, floors, and equipment in the exam room. Replace protective coverings on equipment or surfaces that were exposed to blood, other body fluids, or tissue during the exam.

Storage During the exam, you may need to collect biohazardous specimens, like blood or urine, from the patient for testing. These specimens must be handled and stored properly because they have the potential to be biohazards. Exposure that can spread disease may occur through the following routes:

- Inhalation (breathing)
- Ingestion (swallowing)
- Transcutaneous absorption (absorption through a cut or crack in the skin)

Occupational Safety and Health Administration (OSHA) regulations require storing biohazardous materials separately from food and beverages. Do not place food and beverages in refrigerators, freezers, or cabinets where blood or other potentially infectious materials are present or put specimens in a refrigerator otherwise used to store food and beverages.

It is dangerous to put food or beverages in the laboratory refrigerator for several reasons. If a biohazardous substance is not clearly labeled and you are in a hurry, you might accidentally ingest it. There is always the possibility that containers of biohazardous substances might leak or spill or that residue from the hazardous material might not have been thoroughly cleaned from the outside of containers. This residue could contaminate food or beverages.

OSHA regulations also require that a warning label containing the biohazard symbol be clearly and securely posted on the outside of refrigerators, freezers, and cabinets where biohazardous materials are stored. The government also recommends keeping the laboratory refrigerator and the refrigerator for the employees' personal use in separate rooms. These measures help prevent employees from accidentally putting food and beverages in the wrong place.

OSHA regulations prohibit medical personnel from doing any of the following activities in a room where potentially infectious materials are present:

- Eating
- Drinking
- Smoking
- Chewing gum
- Applying cosmetics
- Handling contact lenses
- Chewing pencils or pens
- Rubbing eyes

These work practice controls, like all OSHA regulations, represent safeguards to protect workers against the health hazards of bloodborne pathogens.

CAUTION: HANDLE WITH CARE

Refrigerator Temperature Control

Health inspectors visit medical facilities periodically to check that health and safety standards are being upheld. One of the first things they check is the temperature of refrigerators. To prevent spoilage or deterioration of testing kits, blood specimens, and other stored materials, the laboratory refrigerator temperature should be maintained between 36°F and 46°F (2°C and 8°C). Keep a thermometer in the refrigerator to monitor the temperature. See Figure 9-5.

Similar guidelines apply to the refrigerator in the employee area. Food spoils quickly in a refrigerator if the temperature is not low enough. The temperature of the food refrigerator should be maintained between 32°F and 40°F (0°C and 4.4°C). In addition to monitoring the temperature, make sure food is not stored in the refrigerator too long. All food containers, including brown bags containing lunches, should be dated and thrown out when their freshness has expired. You can prevent bacteria growth by wiping up food spills immediately and cleaning the interior and exterior of the refrigerator routinely.

Follow office procedures for the routine cleaning of both laboratory and food refrigerators and for the proper temperature

maintenance of refrigerated contents while the refrigerator interiors are cleaned. Specimens, for example, must be kept at a specific temperature at all times. For documentation purposes, keep a log of dates when the laboratory refrigerator is cleaned.

FIGURE 9-5 A temperature monitor is used to maintain a temperature within the refrigerator that prevents spoilage and deterioration of laboratory and food items.

Testing kit and specimen storage often involves refrigeration as a means of preservation. Adequate preservation requires maintaining careful temperature control in a refrigerator. Read the *Caution: Handle with Care: Refrigerator Temperature Control* section for more information on preventing spoilage by controlling refrigerator temperature.

Putting the Room in Order

After ensuring that the examining table is clean, all surfaces are properly disinfected, and all necessary items are stored, take time to straighten the exam room and put things in order. A neatly arranged room boosts patient confidence and supports the impression of a well-run office. It also contributes to the physical safety of patients and staff. Tasks include the following:

- Putting the rolling stool in its place
- Pushing in the examining-table step
- Returning supplies to containers
- Securing sample medications and solutions, prescription pads if used, and other items that may have been left in the room

► Room Temperature, Lighting, and Ventilation

LO 9.4

No patient wants to sit in an unkempt exam room. Nor do patients feel comfortable in a cold, dimly lit, or stuffy room. Adjusting the temperature, lighting, and ventilation is part of keeping the exam room in good order and fit for use.

Room Temperature

Because patients may be wearing only a thin paper gown or drape while in the exam room, you must be sure the exam room is warm enough. Set the thermostat to maintain the temperature at approximately 72°F and make sure there are no drafts from windows or doors. Patients often feel anxious while waiting for the physician; a warm room can help them relax.

Lighting

Good lighting is required to make accurate diagnoses, to correctly carry out medical procedures, and to read orders and instructions. A well-lit room also helps prevent accidents. Adjust room lights and blinds or drapes as necessary in preparation for an exam. If there is an exam lamp with a movable arm, be sure the arm is positioned appropriately. Replace all burned-out lightbulbs as soon as possible.

Ventilation

The air in the exam area should smell fresh and clean. Periodically, you may have to deal with offensive odors from urine, vomitus, body odors, or laboratory chemicals. First you must eliminate the source of the odor, especially if the source is potentially infectious or toxic. Then you can take steps to remove the odor.

Some exam rooms have a ventilation system with an odor-absorbing filter. If the rooms in your office do not, you may be able to turn on a high-speed blower to vent room air to the outside. In some cases, an open window and a fan may be sufficient to freshen the air. Remember to check the room temperature after using fresh-air approaches to odor control.

If necessary, you can temporarily mask unpleasant odors with a room deodorizer or spray. Some sprays also help kill germs. Be careful that the room deodorizer you choose does not have a strong odor.

► Medical Instruments and Supplies LO 9.5

Physicians require various instruments and supplies to perform an exam or procedure. Instruments are tools or implements physicians use for particular purposes. Disposable instruments are often referred to as supplies. You must maintain all instruments and supplies needed in the exam room. This responsibility involves the following three tasks:

- Ordering and stocking all supplies needed for exams and treatment procedures
- Keeping the instruments sanitized, disinfected, or sterilized (as appropriate) and in working order
- Ensuring all instruments and supplies are placed where the physician can easily reach them

Instruments Used in a General Physical Exam

Many of the instruments physicians use are made of reusable fine-grade stainless steel. Some of these instruments may have disposable parts. Physicians also use a number of disposable instruments, like curettes and needles, because these instruments are both convenient and sanitary. Place any such items contaminated with blood or other body fluids in biohazardous waste containers.

These commonly used instruments are shown in Figure 9-6:

- An *anoscope* is used to open the anus for an exam. Although not always used for the general physical examination, a stool specimen is usually obtained in order to check for blood.
- An *examination light* provides an additional source of light during the exam. It is usually on a flexible arm to permit light to be directed to the area being examined.
- A *laryngeal mirror* reflects the inside of the mouth and throat for exam purposes.
- A *nasal speculum* is used to enlarge the opening of the nose to permit viewing. This type of speculum may consist of a reusable handle with a disposable speculum tip, or it may be a disposable one-piece unit.
- An *ophthalmoscope* is a lighted instrument used to examine the inner structures of the eye.
- An *otoscope* is used to examine the ear canal and the tympanic membrane. The otoscope consists of a light source, a magnifying lens, and an ear speculum. An otoscope also may be used to examine the nostrils and the anterior sinuses. Like a nasal speculum, an otoscope may have disposable tips.

- A *penlight* is a small flashlight used when additional light is necessary in a small area. It also may be used to check pupil response in the eye.
- A *reflex hammer*—used to check a patient’s reflexes—has a hard rubber triangular head.
- A *sphygmomanometer*, or blood pressure cuff, is a piece of equipment used to measure blood pressure.
- A *stethoscope* is used to listen to body sounds. It is described in more detail in the *Vital Signs and Measurements* chapter.
- A *tape measure* is a long, narrow strip of fabric, marked off in inches and sometimes in centimeters, used to measure size or development of an area or part of the body.
- A *thermometer* is used to measure body temperature.
- A *tuning fork* tests patients’ hearing.
- A *vaginal speculum* is used to enlarge the vagina to make the vagina and the cervix accessible for visual exam and specimen collection. This instrument is used only for a female when an examination and testing of the female reproductive system are done.

Inspecting and Maintaining Instruments Prior to the exam, make sure all instruments are sanitized, disinfected, or sterilized (as appropriate) and in good working order. For example, test the otoscope and ophthalmoscope to make sure the lights work. Place all rechargeable batteries in a battery charger when the instruments are not in use.

Medical instruments are expensive and are designed to work in precise ways. Read the manufacturers’ directions so you are familiar with the care and maintenance of various instruments. Routinely check instruments for chipping and rusting, and report to the physician any instruments that need repair or replacement.

Arranging Instruments The physician must be able to find and reach instruments easily during an exam. You can assist by placing instruments in the same place for every exam or by arranging them in the order the physician will use them.

Physicians usually begin a general physical exam by examining the patient’s head and face and working down the body. They may want instruments placed in that order. Other physicians may have individual preferences about how they want instruments arranged. In any case, make certain you know each physician’s preferences.

With the exception of the stethoscope, which most physicians carry with them, instruments are kept in one of three places during an exam:

- Mounted on the wall (sphygmomanometer, some otoscopes and ophthalmoscopes)
- Set out on the countertop (penlight, reflex hammer, tape measure, tuning fork, thermometer, some otoscopes and ophthalmoscopes)
- Set on a clean (or sterile, if appropriate) towel or tray (anoscope, laryngeal mirror, nasal speculum, vaginal speculum)

FIGURE 9-6 These instruments may be used in a general physical exam.

Preparing Instruments You must prepare some instruments before they can be used. For example, you may need to warm a vaginal speculum by holding it under warm water just prior to the exam. You might warm the mirrored end of the laryngeal mirror with water or over an alcohol lamp. You also can spray it with a special spray that prevents fogging. Any time you will be handling instruments, you must first wash your hands. If the instruments are sterile, you also must wear sterile gloves.

Cleaning Instruments After the exam, put used instruments in a container and take them to the cleaning area. Always handle instruments carefully because mishandling can alter their precision. Dispose of supplies in the appropriate containers and use approved procedures for sanitizing, disinfecting, and sterilizing reusable instruments and equipment. Refer to Table 9-3 for general guidelines on cleaning instruments.

TABLE 9-3 General Guidelines for Cleaning Instruments

Process	Guidelines*	Instruments
Sanitization	- Use detergent, or as indicated by the manufacturer. - Applies to instruments that do not touch the patient or that touch only intact skin - Disinfect these instruments after sanitization if they have come in contact with blood or other body fluids.	- Ophthalmoscope - Otoscope - Penlight - Reflex hammer - Sphygmomanometer - Stethoscope - Tape measure - Tuning fork
Disinfection	- Use only EPA-approved chemical or a 10% bleach solution to kill infectious agents outside the body. - Applies to instruments that touch intact mucous membranes but do not penetrate the patient's body surfaces	- Laryngeal mirror - Nasal speculum
Sterilization	- Use an autoclave or approved method to kill all microorganisms. - Applies to instruments that penetrate the skin or contact normally sterile areas of the body	- Anoscope - Curette - Needle (reusable) - Syringe (reusable) - Vaginal speculum

* Keep in mind, these guidelines are general. Each office may have its own methods and schedule for cleaning instruments, depending on the office's specialty.

Supplies for a General Physical Exam

Supplies for a general physical exam may be either disposable or consumable. Figure 9-7 shows various types of supplies.

Disposable supplies are items that are used once and discarded. These include the following:

- Cervical scraper (a plastic or wooden scraper used to obtain samples of cervical secretions used for female exams only)

FIGURE 9-7 These supplies may be used in a general physical exam.

© McGraw-Hill Education. Aaron Roeth, photographer

- Cervical brush or broom (specialized collection devices often used in conjunction with a cervical scraper to obtain cervical secretions)
- Cotton balls
- Cotton-tipped applicators
- Curettes
- Disposable needles
- Disposable syringes
- Gauze, dressings, and bandages
- Glass slides
- Gloves, both sterile and exam (nonsterile) types
- Paper tissues
- Prepared paper slides used to test the stool for the presence of **occult blood** (blood not visible to the naked eye)
- Specimen containers
- Tongue depressors

Consumable supplies are items that can be emptied or used up in an exam. These items include the following:

- Fixative** (a chemical spray used for preserving a specimen obtained from the body for pathologic exam)
- Isopropyl alcohol (for cleansing skin)
- Lubricant

As they do with instruments, physicians may have a preferred arrangement of supplies for the general physical exam. Figure 9-8 shows a typical arrangement of instruments. Certain supplies, like needles, medications, and prescription blanks, if used, should be kept in a locked cabinet away from patient access.

Storing Supplies You can use the cabinets and drawers in the exam room to store nonperishable supplies. Store every item in its own place so you can find it quickly. Consider color-coding or labeling drawers and cabinets so you can easily locate items. Store supplies that come in various sizes, like bandages, according to size and routinely straighten and clean the insides of all exam room cabinets and drawers.

FIGURE 9-8 Arrange the instruments for a general physical exam so that they are convenient for the doctor.

© David Kelly Crow

Restocking Supplies To be sure you have a sufficient quantity of items on hand, order new supplies well in advance of needing them. A good guideline to follow is to order a new supply when the first half of a box, tube, or bottle has been used up. A recordkeeping system will help you determine which supplies you need to restock most frequently and how long it takes for new supplies to arrive. Keep track of the following information in order to develop such a system:

- The types of supplies your office uses
- The quantities of each type of supply used in a given amount of time, such as a month
- The frequency with which you must reorder particular supplies
- The names of various suppliers, along with the amount of time it takes to receive your orders

PROCEDURE 9-1 Performing Sanitization with an Ultrasonic Cleaner

Procedure Goal: To decontaminate items safely and effectively using an ultrasonic cleaner

OSHA Guidelines:

Materials: Ultrasonic cleaner, contaminated items and instruments, ultrasonic cleaning fluid, and manufacturer's directions

Method:

1. Review the manufacturer's directions for safe operation of the ultrasonic cleaner.
2. Fill the container of the ultrasonic cleaner with water. Look for the fill line on the machine. In some cases, you may use distilled water.
3. Add the directed amount of ultrasonic cleaning fluid. Typically, only a small amount of fluid is used. Check the directions.
4. Plug in and turn on the ultrasonic cleaner. Some cleaners require a warm-up period. Check the instructions.
5. Separate instruments and equipment made of different metals.

RATIONALE: Different metals may fuse together during the cleaning process, making them useless.

6. Separate instruments with sharp points.
RATIONALE: To avoid injury
7. Open hinges on instruments and equipment.
RATIONALE: Contaminated materials can become trapped between two surfaces.
8. Place instruments and equipment in the ultrasonic cleaner, but do not overfill.
9. Close the lid, turn on the machine or timer, and wait for the cycle to be completed.
10. Rinse each instrument or piece of equipment in cool, running water and then distilled or demineralized water as policy dictates.
RATIONALE: Ultrasonic cleaning fluid may cause damage to instruments or equipment.
11. Dry each instrument or piece of equipment.
12. Prepare each item for storage or further disinfection or sterilization.
13. Replace ultrasonic cleaning solution according to office policy and manufacturers' guidelines.
RATIONALE: Cleaning solution can be used for several cleaning baths but must be replaced as needed to maintain effectiveness.

PROCEDURE 9-2 Guidelines for Disinfecting Exam Room Surfaces

Procedure Goal: To reduce the risk of exposure to potentially infectious microorganisms in the exam room

OSHA Guidelines:

Materials: Utility gloves, disinfectant (10% bleach solution or EPA-approved disinfecting product), paper towels, dustpan and brush, tongs, forceps, and a clean sponge or heavy rag

Method:

1. Wash your hands and don utility gloves.
2. Remove any visible soil from exam room surfaces with disposable paper towels or a rag.
RATIONALE: Removing visible soil first allows for better penetration of the disinfectant.
3. Thoroughly wipe all surfaces with the disinfectant.

FIGURE Procedure 9-2 Step 4 Because broken glass may be contaminated, never pick it up directly with your hands. Use a brush and dustpan, tongs, or forceps to clean it up.

© Cliff Moore

4. In the event of an accident involving a broken glass container, use tongs, a dustpan and brush, or forceps to pick up shattered glass, which may be contaminated.
RATIONALE: *Using your fingers to pick up broken glass puts you at risk for exposure to bloodborne pathogens.*
5. Remove and replace protective coverings, like plastic wrap or aluminum foil, on equipment if the equipment or the

coverings have become contaminated. After removing the coverings, disinfect the equipment and allow it to air-dry. (Follow office procedures for the routine changing of protective coverings.)

6. When you finish cleaning, dispose of the paper towels or rags in a biohazardous waste receptacle. (This step is especially important if you are cleaning surfaces contaminated with blood, other body fluids, or tissue.)
7. Remove the gloves and wash your hands.
8. If you keep a container of 10% bleach solution on hand for disinfection purposes, replace the solution daily to ensure its disinfecting potency.

FIGURE Procedure 9-2 Step 8 Replace the bleach solution each day to ensure its disinfecting potency.

© McGraw-Hill Education

SUMMARY OF LEARNING OUTCOMES	
LEARNING OUTCOMES	KEY POINTS
9.1 Describe the layout and features of a typical examination room.	A typical examination room is about 8 × 12 feet, large enough to accommodate the physician, the patient, and one assistant. Instruments and equipment in the room should be easily accessible.
9.2 Differentiate between sanitization and disinfection.	Sanitization is the scrubbing of instruments and equipment with special brushes and detergent to remove blood, mucus, and other contaminants or media where pathogens can grow. Disinfection uses special cleaning products applied to instruments and equipment to reduce or eliminate infectious organisms.
9.3 List steps to prevent the spread of infection in the exam and treatment rooms.	Steps involved in preventing the spread of infection in the examination room include covering the examination table with a paper cover and changing the cover between each patient. It is also important to disinfect all surfaces that come in contact with blood or other body fluids after each patient and at the beginning and end of the day.

9.4 Describe the importance of temperature, lighting, and ventilation in the exam room.	A comfortably warm, well-lit, and properly ventilated room will help the patient feel comfortable and more relaxed during the examination.
9.5 Identify instruments and supplies used in a general physical exam and tell how to arrange and prepare them.	A variety of instruments and supplies are used in a general physical examination. To ensure the examination room always has the necessary instruments and supplies, the medical assistant should order and stock all supplies needed for examinations and treatment procedures; keep the instruments sanitized, disinfected, or sterilized and in working order; and place all instruments and supplies where the physician can easily reach them.

CASE STUDY CRITICAL THINKING

© McGraw-Hill Education

Recall Shenya from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding her case.

1. What needs to be done before Shenya is brought back into the exam room?
2. Shenya is diagnosed with community-acquired MRSA (a highly contagious microorganism).

What measures should you take to ensure there is no transfer of infection?

3. After Shenya's examination, you will need to use an ultrasonic cleaner for sanitization. Describe how you would proceed and what source you would use if you had questions about the cleaner you are using.

EXAM PREPARATION QUESTIONS

1. (LO 9.1) Door-opening hardware required by the ADA can be grasped with one hand and
 - a. Can be locked securely
 - b. Is marked with reflective tape
 - c. Does not require twisting the wrist to open
 - d. Does not catch completely
 - e. Opens automatically
2. (LO 9.5) Which of the following is a disposable supply?
 - a. Glass slides
 - b. Lubricant
 - c. Fixative
 - d. Isopropyl alcohol
 - e. Nasal speculum
3. (LO 9.2) Which of the following may be sanitized and reused without further disinfection or sterilization?
 - a. Curette
 - b. Otolarynx
 - c. Laryngeal mirror
 - d. Anoscope
 - e. Vaginal speculum
4. (LO 9.1) Which of the following would you be *least* likely to find in an examination room?
 - a. High-intensity lamp
 - b. Medications
 - c. Biohazardous sharps container
 - d. Rolling stool
 - e. Metal wastebasket with lid
5. (LO 9.2) Which disinfectant would *least* likely be corrosive or require ventilation when in use?
 - a. Alcohol
 - b. Bleach
 - c. Hydrogen peroxide
 - d. Formaldehyde
 - e. Iodine
6. (LO 9.3) In which of the following situations would alcohol-based hand cleaner most likely be acceptable for use?
 - a. After cleaning up a blood spill
 - b. After changing the paper on the exam table
 - c. After assisting with suturing
 - d. After your break
 - e. After helping a patient in the restroom

7. (LO 9.3) How often should you discard a 10% bleach solution?
- Monthly
 - Weekly
 - Daily
 - Hourly
 - Bleach solution is stable; do not discard it
8. (LO 9.4) A patient vomits in exam room 2. Which of the following would be your best course of action?
- Immediately call the housekeeping department to clean it up
 - Spray the room with deodorizer and leave it empty for at least 15 minutes
 - Clean up the vomit and then open the window or spray a room deodorizer
 - Clean up the vomit, then turn off the ventilation system so the odor does not permeate the entire office
 - Turn on the ventilation system and spray deodorizer
9. (LO 9.5) What instrument is used to look inside the ear?
- Ophthalmoscope
 - Anoscope
 - Nasal speculum
 - Vaginal speculum
 - Otoscope
10. (LO 9.5) Which of the following consumable supplies is used to preserve a specimen obtained during an exam?
- Lubricant
 - Alcohol
 - Hydrogen peroxide
 - Fixative
 - Bleach

SOFT SKILLS SUCCESS

Recall Shenya from the case study at the beginning of the chapter. Dr. Williams has finished seeing Shenya and asks you to help her with a patient having a mole removal in the procedure room. Dr. Williams is on a tight schedule because she needs to get to the hospital to see another patient. You know that the room in which Shenya was seen previously still needs to be disinfected and restocked, so you ask Michelle, another medical assistant in the office, to clean the room for you. You explain that Dr. Williams has asked you to assist with a mole removal. Michelle tells you that she does not

want to clean the room because Shenya has MRSA and she doesn't want to get it. She also states that since the room is your responsibility she doesn't think that she should have to clean the room. How should you respond to Michelle?

Go to PRACTICE MEDICAL OFFICE and complete the module Clinical - Office Operations.

CASE STUDY

PATIENT INFORMATION	Patient Name	DOB	Allergies
	Valarie Ramirez	8/4/19XX	Penicillin
PATIENT INFORMATION	Attending	MRN	Other Information
	Paul F. Buckwalter, MD	829-78-462	Past HX: AB x1

Valarie Ramirez, a 33-year-old female, arrives at the clinic with complaints of “a cold that won’t go away.” She states that she has had body aches, a cough, and fever for at least 3 days and feels like she is getting worse rather than better. When asked, she states that she did not get a flu shot this year. After a physical exam, Dr. Buckwalter orders a CBC

© McGraw-Hill Education

and chest X-ray and gives her a prescription for antibiotics. Dr. Buckwalter will be in touch with her when the lab and X-ray results are in. As she leaves, Valarie asks that you contact her by e-mail about her lab and X-ray results. She states that although she trusts Dr. Buckwalter, she finds him “gruff” and “unsympathetic” and would rather receive her results in this manner.

Keep Valarie in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

LEARNING OUTCOMES

After completing Chapter 10, you will be able to:

- 10.1** Explain why well-written documents are important to the image of the medical practice.
- 10.2** Describe the types of document supplies that will be used in a medical office.
- 10.3** Outline the general guidelines to effective writing.
- 10.4** List and explain the purpose of different types of documents used in a medical office.
- 10.5** Explain why it is important to have a signed written consent from the patient for e-mail communications.
- 10.6** Describe the tasks involved in editing and proofreading a document.
- 10.7** Outline the steps for preparing a completed letter for mailing.
- 10.8** Explain the differences among the types of mail services offered by the USPS.
- 10.9** Describe the steps involved in processing incoming mail.

KEY TERMS

- annotate
- body
- clarity
- complimentary closing
- concise
- editing
- full-block letter style
- inside address
- invoice
- modified-block letter style
- optical character reader (OCR)
- proofreading
- salutation
- signature block
- simplified letter style
- statement
- subject line
- template

- V.C.7** Recognize elements of fundamental writing skills
- V.C.8** Discuss applications of electronic technology in professional communication
- V.P.8** Compose professional correspondence utilizing electronic technology

7. Records Management

- a. Perform basic keyboarding skills, i.e. Microsoft Word, etc.
- b. Utilize Electronic Medical Records (EMR) and Practice Management Systems
- c. Comply with federal, state, and local laws relating to exchange of information and describe elements of meaningful use and reports generated

8. Administrative Procedures

- a. Gather and process documents
- f. Display professionalism through written and verbal communications

► Introduction

Communication skills—verbal, nonverbal, and written—are important in nearly every profession. Consider, just for a moment, the way you communicate verbally, nonverbally, and in writing, and what this may say about you to your audience. Now, consider what your communication skills may say to others about the office where you work as a medical assistant. Written documents—whether they are produced in the traditional paper format or in an electronic format—are tangible demonstrations of the office staff’s ability to communicate and conduct business.

The community as a whole may often evaluate an entire medical practice by the work of one employee. When a letter, form, or document is carelessly prepared and sent into the community, the practitioner may be judged as “careless.” However, when a letter or other business correspondence is constructed in a neat, concise, and well-organized fashion, the practitioner is often judged to be organized and competent. The skill demonstrated in the creation of a simple business document reflects on the medical skills of the practitioner and the practice. So it is fair to say that professional image is conveyed in all written correspondence.

Because written documents also serve as legal records, all paper and electronic documents must be prepared with great care and attention to detail. The medical assistant’s administrative role includes the creation of consistently accurate and clear documents.

In this chapter, you will learn how to write effectively. You will develop skills in composing business documents using different writing styles and formats. You will also learn how to professionally manage all forms of correspondence commonly used in an ambulatory care setting.

► Professionalism and Document Preparation

LO 10.1

As in any business, correspondence from healthcare professionals to patients and colleagues must be handled carefully, with appropriate attention to content and presentation. By learning how to create, send, and receive correspondence and other types of documents, you can ensure positive, effective communication between your office and others. Well-written, neatly prepared correspondence is one of the most important means of communicating a professional image for the medical office (Figure 10-1).

► Selecting Document Supplies

LO 10.2

The first step in preparing professional-looking documents is choosing the right supplies. Many offices already have most of these supplies on hand. However, you may be responsible for selecting and ordering such supplies. You may need to make decisions about letterhead paper, envelopes, labels, invoices, and statements.

Letterhead Paper

Letterhead refers to formal business stationery on which the physician (or practice) name and address are printed at the top, along with the names of all the associates in the practice. In most cases, the office phone and fax numbers are listed along with the office website information and an e-mail address. Letterhead is used for all professional, written correspondence coming from the office, but it is important to note that letterhead is used only for the first page of a letter. If a letter is more than one page, all the additional pages are printed on plain paper (the same color and bond as the letterhead).

FIGURE 10-1 Well-written correspondence is vital to the professional reputation of a medical practice.

© Image Source/Getty Images RF

Letterhead paper can be cotton fiber bond (sometimes called rag bond) or sulfite bond. Cotton bond, which is usually more expensive than other paper types, contains a watermark—an impression or pattern that can be seen when the paper is held up to the light—that indicates that the paper is of high quality. The most popular cotton bond used for letterhead is 25% cotton because it is economical, but all higher grades can be used. Sulfite bond paper begins as wood pulp, which is treated with peroxide or hypochlorite to bleach it a paler color. Further chemical processes give sulfite paper a brilliant white appearance, making it a favorite for producing photographs. Businesses, including medical practices, use sulfite paper for portfolios, folders, and other items that need an attractive and durable paper.

The two most common letterhead paper sizes are standard and legal. Standard, or letter-size, paper is $8\frac{1}{2} \times 11$ inches and is used for most general business documents. Legal size is $8\frac{1}{2} \times 14$ inches and, as the name indicates, is used for legal and especially lengthy documents.

Formal invitations or announcements, like those announcing an office opening, may be engraved or embossed. Embossing is a process in which the letters are pressed into the paper and often set in black, gold, or silver.

Envelopes

Envelopes are used for correspondence, invoices, and statements. Typically, business letterhead and matching envelopes are printed together on higher-quality paper. Although

the letterhead format for statements and invoices may be the same, these documents and their envelopes are usually printed on a lower-quality paper.

Familiarize yourself with the many types of envelopes used in the medical office.

- The most common envelope size used for correspondence is the No. 10 envelope (also called business size). It measures $4\frac{1}{2} \times 9\frac{1}{2}$ inches.
- Envelopes used for invoices and statements can range from No. 6 ($3\frac{3}{8} \times 6\frac{1}{2}$ inches) to No. 10. These envelopes usually have a transparent window that allows the address on the invoice or statement to show through, saving time and reducing the potential for errors involved in retyping the address.
- Smaller payment return envelopes—preaddressed to the physician's office—are often included along with the statement, for the patient's convenience.
- Tan Kraft envelopes, or clasp envelopes, are available in many sizes and are used to send large or bulky documents.
- Padded envelopes are used to send documents or materials, like slides, that may be damaged in the normal course of mail handling.
- The stock and quality of the envelope should always match the stationery. An office typically has two grades of envelopes with a return address. One is a less expensive stock and quality of paper with a return address printed in black, used for everyday documents like insurance inquiries. The second is a higher-quality, more expensive paper with a return address printed in colors that match the office letterhead, which is used for professional correspondence.
- Data mailers are produced by a computer and are used by larger businesses and hospitals for batch mailings of items like paychecks, appointment reminders, and some invoices. The envelopes are opened by tearing off perforated sides, peeling the envelope apart, or utilizing a pull tab.

Labels

Address labels, printed from a computerized mailing list, can make the process of addressing envelopes for bulk mailings much speedier. For example, you may have to send a notice of a change in office hours or a quarterly office newsletter to a large number of patients in a practice.

You may choose to set up a system for frequently used labels. Many practices write insurance inquiries and other business letters to the same addresses repeatedly. For fast and easy access, it is helpful to print out labels of the same address a full page at a time. Pages of labels can then be stored in alphabetized folders near the transcription desk. Excel databases can also be set up to print labels and to insert names and addresses in standardized formats known as **templates**.

Invoices and Statements

Several types of invoices and statements are currently used. An **invoice** lists a product or service rendered and is used when billing for that product or service. A **statement** is a summary of total amounts owed, including outstanding charges as well as payments received. Patient statements include items such

as services rendered, payments received, and outstanding balances. There are different types of statements: preprinted statements, computer-generated statements, and superbills (encounter forms)—discussed in the *Patient Collections and Financial Management* chapter.

► Effective Writing

LO 10.3

Written communication is much like holding a conversation in person. The recipient will form a fairly quick impression of the practitioner or the office based on the appearance of the document and the way the message in the document makes the recipient feel, be it a letter, patient instructions, or even an e-mail. All written communication must be clear and well written, and it must politely and concisely convey the appropriate information to the recipient. To create effective, professional correspondence that reflects well on the practice, be sure that you use clear and **concise** language, the active voice, and an appropriate style. Following are some general guidelines to help you write more effectively.

- Before you write, know the type of person to whom you are writing. Consider him to be your audience. Is the letter to a physician, a patient, a vendor, or fellow staff members? Decide if the tone should be formal or more relaxed.
- Know the purpose of the letter before you begin and make sure your letter accurately conveys that purpose.
- Be concise. Use short sentences. Be brief. Be specific.
- Do not use unnecessary words. Use the simplest way to say what you mean.
- Show **clarity** in your writing; state your message so that it can be understood easily.
- Use the active voice whenever possible. Voice shows whether the subject of a sentence is acting or is being acted upon. Here is an example of the active voice:

“Dr. Huang is seeing 18 patients today.”

Here is an example of the same sentence, written in the passive voice:

“Eighteen patients will be seen by Dr. Huang today.”

Note that the active voice is more direct and livelier to read.

- Use the passive voice, however, to soften the impact of negative news:

“Your account will be turned over to a collection agency if we do not receive payment promptly.”

It would sound harsher to say

“We will turn over your account to a collection agency if we do not receive payment promptly.”

- Always be polite and courteous.
- Always check spelling and the accuracy of dates and monetary figures.
- Always check your grammar. Do not use slang.
- Avoid leaving “widows and orphans” or dangling words and phrases. These are words and short phrases at the end or beginning of paragraphs that are left to sit alone at the top or bottom of a page or column or separated from the rest of the thought. Do not start a paragraph at the bottom of a page if the rest of the sentence must be continued on the next page.

Grammar

Although seldom a popular topic in today’s text-messaging culture, excellent grammar is essential for every medical assistant who composes professional documents. Let’s look at Table 10-1 for a quick review of the parts of speech.

The basic rules of writing should be followed when composing professional documents. Table 10-2 summarizes these rules.

Because certain information in an office is used repeatedly, commonly used paragraphs and even entire letter templates are often used in many practices. These templates, or bodies of text,

TABLE 10-1 The Parts of Speech

Part of Speech	Description	Example
Nouns	Nouns describe a person, place, thing, concept, thought, or idea. <i>Proper nouns</i> describe specific persons, places, or things.	Massachusetts, town, assistant, Dr. Whalen, freedom, kindness
Pronouns	Pronouns replace nouns by referring back to them.	He, she, it, they, him, her, us, them, theirs, you, yours, ours, mine
Verbs	Action verbs describe movement. Linking verbs express a condition or state. Linking verbs also express the senses.	Walk, type, speak, laugh Is, are, am, be, being, was Hear, smell, taste, touch, feel
Adjectives	Adjectives describe nouns and pronouns or explain which one, how many, or what kind. Adjectives also include <i>articles</i> which introduce nouns.	Playful, talented, medical, tasty; numbers are also commonly used as adjectives; common articles include the, a, and an.
Adverbs	Adverbs describe verbs, adjectives, or other adverbs and explain when, where, how, and to what extent.	Extremely, always, frequently, truly, positively
Prepositions	Prepositions are connecting words demonstrating a relationship between nouns, pronouns, or other words.	at, by, from, on, to, in, of, into, with
Conjunctions	Conjunctions join words or phrases together.	and, or, nor, but
Interjections	Interjections show strong feeling or emotion. They are often followed by an exclamation point or a comma if used in professional writing.	Help! Ouch! Call 911!

TABLE 10-2 Basic Rules of Writing

Word Division	Divide • According to pronunciation. • Compound words between the two words from which they derive. • Hyphenated compound words at the hyphen. • After a prefix. • Before a suffix. • Between two consonants that appear between vowels. • Before –ing unless the last consonant is doubled; in that case, divide before the second consonant. Do not divide • Suffixes like –sion, –tial, and –gion. • A word so that only one letter is left on a line. • A word so that only part of a word stands alone on the last line of a paragraph.
Capitalization	Capitalize • All proper names. • All titles, positions, or indications of family relation when preceding a proper name or in place of a proper noun (not when used alone or with possessive pronouns or articles). • Days of the week, months, and holidays. • Names of organizations and membership designations. • Racial, religious, and political designations. • Adjectives, nouns, and verbs that are derived from proper nouns (including currently copyrighted trade names). • Specific addresses and geographic locations. • Sums of money written in legal or business documents. • Titles, headings of books, magazines, and newspapers.
Plurals	• Add <i>s</i> or <i>es</i> to most singular nouns (plural forms of most medical terms do not follow this rule). • With medical terms ending in <i>is</i>, drop the <i>is</i> and add <i>es</i>: metastasis/metastases epiphysis/epiphyses • With terms ending in <i>um</i>, drop the <i>um</i> and add <i>a</i>: diverticulum/diverticula atrium/atria • With terms ending in <i>us</i>, drop the <i>us</i> and add <i>i</i>: calculus/calculi bronchus/bronchi (Two exceptions to this are <i>virus/viruses</i> and <i>sinus/sinuses</i>.) • With terms ending in <i>a</i>, keep the <i>a</i> and add <i>e</i>: vertebra/vertebrae
Possessives	To show ownership or relation to another noun • For singular nouns, add an apostrophe and an <i>s</i>. • For plural nouns that do not end in an <i>s</i>, add an apostrophe and an <i>s</i>. • For plural nouns that end in an <i>s</i>, just add an apostrophe.
Numbers	Use numerals • In general writing, when the number is 11 or greater. • With abbreviations and symbols. • When discussing laboratory results or statistics. • When referring to specific sums of money. • When using a series of numbers in a sentence. Tips • Use commas when numerals have more than three digits. • Do not use commas when referring to account numbers, or policy numbers. • Use a hyphen or an en dash with numerals to indicate a range. An en dash is typed using CTRL plus the hyphen key on the number pad.

are saved in the computer for quick and easy repeated access. With very few keystrokes, the material can be selected and displayed almost immediately. Then, minor changes specific to the requirements of the document or letter can be made. When making changes to a template, make sure to read the document carefully once you have completed your work to ensure that all necessary changes have been made. Be sure to save your changes to a different file name, not to the actual template document.

It is also helpful to use the cut, copy, and paste features in word processing software to quickly piece together a document that uses sentences or paragraphs from other documents. Large and small bodies of text can easily be moved or copied from document to document, instead of rekeying information. These features help save time for the medical assistant.

► Medical Office Documents and Correspondence

LO 10.4

As a medical assistant, you will be responsible for preparing routine documents and correspondence at the physician's request. You may transcribe some documents from the doctor's dictation and compose others from notes.

The purpose of most patient correspondence is to explain, clarify, or give instructions or other information. Correspondence includes

- Letters of referral.
- Letters about scheduling, canceling, or rescheduling appointments.
- Patient reports for insurance companies.
- Instructions for examinations or laboratory tests.
- Answers to insurance or billing questions.
- Cover letters or form letters to order supplies, equipment, or magazine subscriptions.

Parts of a Business Letter

Figure 10-2 illustrates the parts of a typical business letter. Format details may vary from office to office, but the parts of a business letter are generally the same in most offices. Specific characteristics of the parts included in a typical business letter are discussed here.

Letterhead The letterhead is the preprinted portion of formal business stationery.

Dateline The dateline consists of the month, day, and year. It should begin about three lines below the preprinted letterhead text on approximately line 15. The month should always be spelled out, and there should be a comma after the day.

Delivery Notation Type any special or urgent delivery method, such as CERTIFIED MAIL, REGISTERED MAIL, or SPECIAL DELIVERY, two lines below the dateline.

Inside Address The **inside address** contains all the necessary information for the letter's correct delivery. The inside

address spells out the name and address of the person to whom the letter is being sent. In general, you should

- Key, or type, the inside address on the left margin, two to four spaces down from the date. It should be two, three, or four lines in length.
- Include a *courtesy title* (Dr., Mr., Mrs., and so on) and the intended recipient's full name. Note: If Dr. is used, do not put MD after the name. For example, either of these forms is acceptable: Dr. John Smith; John Smith, MD. This form is *not* acceptable: Dr. John Smith, MD. Generally, the John Smith, MD format is used for the inside address and the Dear Dr. Smith format is used for the salutation.
- Include the intended receiver's title on the same line with the name, separated by a comma, or on the line below it.
- Include the company name, if applicable.
- Use numerals for the street address, except the single numbers one through nine, which should be spelled out—for example, Two Markham Place.
- Spell out numerical names of streets if they are numbers less than ten.
- Spell out the words *Street*, *Drive*, and so on.
- Include the full city name; do not abbreviate.
- Use the two-letter state abbreviation recommended by the US Postal Service (USPS). These abbreviations are easily found online by searching for "USPS state abbreviations."
- Leave one space between the state and the zip code; include the zip + 4 code, if known.

Attention Line An attention line is used when a letter is addressed to a company but sent to the attention of a particular individual. If you do not know the individual's name, call the company directly to inquire about the appropriate contact person's name. A colon between the word *Attention* and the person's name is optional. Place the attention line two lines below the inside address (if used).

Salutation When addressing a person by name, use a **salutation**—a written greeting such as "Dear"—followed by Mr., Mrs., or Ms. and the person's last name. The salutation should be keyed at the left margin on the second line below the inside address. A colon should follow. When you do not know the name, it is becoming common practice to use the business title or department in the salutation, as in "Dear Sir:" or "Dear Laboratory Director:" or "Dear Claims Representative:." This also avoids confusion if you do not know the gender of a person with a name such as Pat or Chris.

Subject Line A **subject line** is sometimes used to bring the subject of the letter to the reader's attention. The subject line is not required, but, if it is used, it should be keyed on the second line below the salutation. The subject line may be flush with the left margin, indented five spaces, or centered on the page. The subject line should be limited to two or three words and should be keyed in all capital letters to capture the reader's attention. Some offices use "RE:" (short for *regarding*) instead of the word *Subject*.

Letterhead	 BWW Medical Associates, PC 305 Main Street, Port Snead YZ 12345-9876 Tel: 555-654-3210, Fax: 555-987-6543 Web: BWWAssociates.com	Paul F. Buckwalter, MD Alexis N. Whalen, MD Elizabeth H. Williams, MD
Dateline	November 14, 20XX	
Delivery Notation	CERTIFIED MAIL	
Inside Address	Mr. Hunter Boyd 4080 Magnolia Point Drive Port, Snead YZ 12345	
Salutation	Dear Mr. Boyd:	
Subject Line	SUBJECT: RESCHEDULING OF APPOINTMENT	
Body	Unfortunately, Dr. Buckwalter will not be in the office on December 5, 20XX, and we must reschedule your appointment for that date. Please call our office at your earliest convenience to arrange for a new appointment date and time. Your health is of great concern to us and we apologize for any inconvenience this rescheduled appointment may cause you.	
Complimentary Closing	Sincerely,	
Signature Block	 Malik Katahri Office Manager	
Identification Line	MK: mp	
Notations	Enc: Appointment calendar C: Miguel A. Perez, Scheduling Coordinator	

FIGURE 10-2 Knowing the parts of a typical business letter enables medical assistants to create written documents that reflect well on the office.

Body The **body** of the letter begins two lines below the salutation or subject line. The text is single-spaced with double-spacing between paragraphs.

If the body contains a list, set the list apart from the rest of the text. Leave an extra line of space above and below the list. For each item in the list, indent 5 to 10 spaces from each margin. Single-space within items, but leave an extra line between items. A bulleted list has a small, solid, round circle before each item.

Complimentary Closing The **complimentary closing** is placed two lines below the last line of the body. Capitalize only the first word of the closing. “Sincerely” is a common closing. “Very truly yours” and “Best regards” are also acceptable closings in business correspondence. A comma is placed after the complimentary closing.

Signature Block The **signature block** contains the writer’s name on the first line and the writer’s business title on

the second line. The block is aligned with the complimentary closing and typed three to four lines below it, to allow space for the signature.

Identification Line The letter writer's initials followed by a colon or slash and the typist's initials are sometimes included in the letter. These initials called the *identification line* may also be referred to as *reference initials*. This line is typed flush left, two lines below the signature block.

Notations Notations at the bottom of the letter may include an identification of any items enclosed with the letter (enclosures) and the names or initials of other people to whom a copy of the letter is being sent (Figure 10-2). Examples of enclosures include office brochures, appointment cards, and forms that the patient should complete. If the letter includes enclosures, type "Enc," "Encl," or "Encs" (for more than one enclosure) flush left, one or two lines below the identification line (if used). Check your office style to determine whether to use punctuation. Then list the items that are being enclosed with the letter. When noting copies sent to other recipients, use a separate line two lines below the enclosure line (if used) and begin the line with "C:" or "c:". Follow this with the names and titles, or in some cases the initials, of people who will receive copies of the letter.

Letter Format

Follow these general formatting guidelines for all letters.

- The margin is the space around the edges of a form or letter that is left blank. The standard setting for margins in business correspondence is 1 inch (left and right margins) for 8½-inch-wide paper.
- Roughly vertically center the letter on the page according to the length of the letter. For shorter letters, you can use wider margins and start the address farther down the page. For longer letters, use standard margins but start higher up on the page.
- Single-space the body of the letter. Double-space between paragraphs or parts of the letter.
- Use short sentences (no more than 20 words on average).
- Include at least two or three sentences in each paragraph.
- Avoid long paragraphs; use paragraphs of fewer than 10 lines.

As stated previously in the discussion on supplies, for multipage letters, use letterhead for the first page and matching plain bond paper for the subsequent pages. Use a 1-inch margin at the top and include a heading with the addressee name, date, and page number on all subsequent pages. The text of the letter should continue about three lines below the heading.

Letter Styles

Four common letter styles are used for different purposes. Your office is likely to have a preferred style in place. Let's take a look at each of these styles individually.

Full-Block Style The **full-block letter style**, also called block style, is typed with all lines flush left. Figure 10-3 shows an example of the block letter style. This style may include a

subject line two lines below the salutation. Block-style letters are quick and easy to write because all lines begin at the left margin. Block style is one of the most common formats used in the medical office.

Modified-Block Style The **modified-block letter style** is similar to full block but differs in that the dateline, complimentary closing, and signature block are aligned and begin at the center, or slightly to the right of the center, of the page (Figure 10-4). This type of letter has a traditional, balanced appearance.

Modified-Block Style with Indented Paragraphs

This style is almost identical to the modified-block style except that the paragraphs are indented ½ inch (Figure 10-5).

Simplified Style The **simplified letter style** is a modification of the full-block style. Figure 10-6 shows an example of the simplified letter style. The salutation is omitted, eliminating the need for a courtesy title. A subject line in all-capital letters is placed between the address and the body of the letter. The subject line summarizes the letter's main point but does not actually use the word *subject*. All text is typed flush left. The complimentary closing is omitted, and the sender's name and title are typed in capital letters in a single line at the end of the letter. This letter style is both easy to read and quick to type. In most medical office situations, however, the simplified letter style may be too informal.

Punctuation Styles

Two different punctuation styles are used in correspondence: open punctuation and mixed punctuation. Once you have selected a style, be sure that you remain consistent and true to the chosen style throughout the letter.

Open Punctuation This style uses no punctuation after the following items when they appear in a letter:

- The word *Attention* in the attention line
- The salutation
- The complimentary closing
- The signature block
- The enclosure and copy notations

Mixed Punctuation This style includes the following punctuation marks used in specific instances:

- A colon after *Attention* in the attention line
- A colon after the salutation
- A comma after the complimentary closing
- A colon or period after the enclosure notation
- A colon after the copy notation

Now that you have a basic understanding of letter styles and formats, including punctuation styles, Procedure 10-1 at the end of the chapter outlines the steps for creating a professional business letter using word processing software.

Alexis N. Whalen, MD
Elizabeth H. Williams, MD

May 28, 20XX

Mr. Shawn Collins
234 Deerfield Drive
Port Snead YZ 12345

Dear Mr. Collins:

Congratulations! Your lab results have come back and, overall, your screenings are great. However, we are a bit concerned about your cholesterol screening result, which is 225. Generally, we like to see our patients with levels under 200.

Please call our office to schedule an appointment with Kaylyn, our clinical medical assistant, to obtain information on diet and exercise programs to help you try to lower your cholesterol number naturally. At that time, she will make an appointment for you to return for a second screening in six months. Also, please check out our website at BWWAssociates.com for delicious low-fat/low-sodium recipe ideas that are easy to prepare and great for the whole family.

As always, if you have any questions at any time, please call the office.

Sincerely,

Elizabeth H. Williams, MD

EHW/mp

FIGURE 10-3 Example of a block-style letter with mixed punctuation. Note that all lines begin at the left margin.

Interoffice Memoranda (Memos)

Interoffice memoranda (memos) are periodically used by medical offices, clinics, and hospitals. Most word processing software has templates for formatting interoffice memos. Memos generally facilitate informal written communication within an office.

The heading for a memo generally consists of the following components, followed by a colon:

TO:
FROM:
DATE:
SUBJECT:

Traditionally, headings were written in all caps, but some templates and offices now use mixed case for the heading. Figure 10-7 reveals what a typical office memo looks like. Refer to Procedure 10-2 at the end of the chapter to review the steps for creating an interoffice memo.

In many large practices, printed memos have been replaced by “e-mail blasts” to reach all employees simultaneously. You will explore e-mail and other electronic communications next.

► Written Communication Using Electronic Format

LO 10.5

It is no secret that electronic communication has taken the United States by storm. Can you answer *yes* to more than two of the followings statements?

- I have multiple personal e-mail accounts.
- I have at least one social media and/or business networking media account and use it daily.
- I use a cell phone for texting.
- I “tweet” at least once a day.

EHW/mp

FIGURE 10-4 Example of a modified-block style letter with mixed punctuation. Note that the dateline, complimentary closing, and signature block begin slightly to the right of center.

- I use other forms of electronic communication.
 - I use online banking and pay my bills online.
- Now, answer the following questions, true or false.
- I have mailed a letter to someone in the past 2 weeks.
 - I pay my bills by writing a check and mailing it.

Electronic communication is the preferred method of communication for many people. For the newest generation, many would rather communicate via text message or on social media than by phone or instead of in-person, face-to-face contact. For this reason, professional, grammatically correct writing (in both electronic and paper format) is largely unused by an increasingly large segment of the population. This cannot hold true for electronic communications coming from a medical office, however. Here, the information is simply too important and must be presented clearly, concisely, and professionally at all times, regardless of the format.

Electronic Media and E-mail to Patients

According to HIPAA law, transmissions that are physically moved from one location to another using magnetic tape, disk, compact disk, or any other portable computer drive are considered electronic media. When used to transport patient information, the portable device and the information it contains must be handled in the same confidential manner as patient paper records. All patient information, regardless of the form, is protected by HIPAA law and is to be guarded by the healthcare provider. The same holds true for e-mail transmissions to and from patients. One word of caution regarding e-mail communications with patients: E-mail is not considered a secure method of communication. As with cell phone communication, information can be *intercepted* and so received by someone who was not the intended recipient. Before undertaking e-mail communication with a patient, be sure to have a signed written consent for e-mail

Mr. Shawn Collins
234 Deerfield Drive
Port Snead YZ 12345

Dear Mr. Collins:

Congratulations! Your lab results have come back and, overall, your screenings are great. However, we are a bit concerned about your cholesterol screening result, which is 225. Generally, we like to see our patients with levels under 200.

Please call our office to schedule an appointment with Kaylyn, our clinical medical assistant, to obtain information on diet and exercise programs to help you try to lower your cholesterol number naturally. At that time, she will make an appointment for you to return for a second screening in six months. Also, please check out our website at BWWAssociates.com for delicious low-fat/low-sodium recipe ideas that are easy to prepare and great for the whole family.

As always, if you have any questions at any time, please call the office.

Sincerely,

Elizabeth H. Williams, MD

EHW/mp

communication on file. Figure 10-8 gives an example of an e-mail consent form.

Once the signed consent is on file, the patient chooses the provider she wishes to communicate with. Depending on the office, by choosing a specific provider, the patient often also agrees to receive e-mail communication from members of that physician's staff, including, but not limited to, nurses, medical assistants, and administrative personnel. The office electronic health record, or EHR, program makes this communication easier in many larger offices. Many EHR programs include an e-mail component and/or a "patient portal" for patients to send and receive communications from the office, as well as pay their medical bills. The beauty of these types of programs is that the patient's e-mail address becomes part of her medical record and is then readily accessible to medical staff members who have access to the patient's chart. Figure 10-9 gives an example of a typical e-mail screen from an EHR program.

Procedure 10-3, found at the end of this chapter, outlines the steps for creating a professional e-mail message. In addition to e-mail messages, many EHR programs also contain templates for completion of electronic letters in often-used formats. Procedure 10-4 at the end of the chapter gives a basic outline of how one of these programs works. If your office uses patient e-mail or a patient portal, don't forget to verify the patient's e-mail address at each visit at the same time you re-verify other demographic information.

Interoffice E-mail

As more and more offices—medical and nonmedical—increase their e-mail use, e-mail and Internet etiquette and rules have become increasingly more important. For example, most offices with Internet access now have written policies regarding e-mail, spelling out the "dos" and "don'ts" concerning use of the practice's e-mail system. The American Medical

INTEROFFICE MEMO

TO: All Staff
FROM: Malik Katahri, Office Manager
DATE: December 14, 20XX
RE: Patient PHI

It has come to my attention that a computer screen was left on while it contained patient protected health information. Worse yet, the computer is in a location where patients and visitors could view it. This is unacceptable.

We all must be very aware of what we are doing at all times and shut off computer screens, even if we are leaving the computer “just for a minute.” Better yet, log off the computer prior to leaving the station. Remember, patient information is to be revealed only on a “business need-to-know basis” and it should NEVER be revealed because someone was temporarily distracted.

Consent to Use E-mail Communication

BWW Medical Associates pledges to use all reasonable measures to protect the private health information of our patients. This includes any information that may be transmitted to or from our office via e-mail. We cannot, however, guarantee the security or confidentiality of information shared via e-mail and we will not accept any liability for disclosure of confidential information that is not caused by professional misconduct on the part of a member of our office team. In order to honor your request to use e-mail communication, we require written consent regarding the following conditions:

- All e-mail messages to or from the patient regarding diagnosis or treatment of a medical condition will become part of the patient's permanent health record. As with any part of the health record, authorized office personnel, including billing and coding professionals in our office, will have access to the information contained within the e-mail message.
- We will forward no e-mail messages, nor the information contained within them, to any third parties, including insurance carriers, without the patient's express written consent, unless otherwise authorized or required by law.
- Because we cannot guarantee that e-mail messages will be received or read within any particular time frame, e-mail is not to be used for transmitting any time-sensitive material or information. E-mail is also not to be used for transmitting information regarding any medical emergency.
- It remains the patient's responsibility to schedule and keep any medically necessary appointments.

I have read and understand the outlined risks associated with e-mail communication between BWW Medical Associates and me. I agree to the conditions and instructions listed above, as well as to any further instructions or limitations BWW Medical Associates may impose regarding e-mail communications. All of my questions have been answered and I understand I may withdraw this consent, in writing, at any time.

Patient Name

Patient E-mail Address

FIGURE 10-8 E-mail consent form.

Informatics Association and Health E-mail (a nonprofit physician outreach program) are two professional organizations that have established policies relating to e-mail. Larger offices with information systems (IS) departments even audit e-mail and Internet usage. Always remember that when you are using the office computer system, no Internet site you access, and no e-mail that you send or receive, is private; it belongs to the office and the practice owners have the right to monitor and even limit the access you have to the computer system. A good rule of thumb to follow regarding any e-mail you send from your office computer is “Would I be OK with my supervisor

seeing this e-mail?” If the answer is not an emphatic “Yes,” do not send it.

Managing E-mail

E-mail management, while helpful on a personal level, is imperative on a professional level. Most offices limit the amount of storage each user has, so it is important to manage the documents you send, receive, keep, and delete, so that documents and e-mails that may be needed later are not inadvertently “lost in the system.” The following management tools will help you manage your Inbox and your saved e-mails.

FIGURE 10-9 Incoming e-mail message from patient.
© Practice Fusion®

- Check your office e-mail regularly, emptying any unwanted e-mails.
- Do not open unidentifiable e-mails, even if they appear to be sent from someone you trust.

If there is no subject line topic, contact the sender by simply hitting reply (without opening the contents) to see if that person actually sent it or if it is SPAM (unwanted, potentially virus-carrying e-mail) that may damage your computer, or, worse, the entire office system. The office should have up-to-date antivirus software running, but always be very cautious of unsolicited e-mails.

- Set up subfolders for e-mails that have to be kept for an indefinite period of time.
- Set time limits for deleting or retaining messages.
- Save all e-mail responses that contain protected health information (PHI).
- Take advantage of the e-mail system's file management programs by setting up "rules" to automatically move certain e-mails (such as from patients or other physician offices) to folders you have set up as "high priority," so that these important messages are not accidentally "lost" or "forgotten." Check these high-priority folders several times during the day.

▶ Editing and Proofreading

LO 10.6

Editing and proofreading take place after you create the first draft of any document, on paper or in electronic format. **Editing** involves checking a document for factual accuracy, logical flow, conciseness, clarity, and tone. **Proofreading** involves checking a document for grammatical, spelling, and formatting errors. When possible, ask another person to proofread your work as well. *Never* skip over the very important steps of editing and proofreading!

Tools for Editing and Proofreading

Reference books can help you prepare letters that appear professional. Keep the following tools available.

Dictionary An up-to-date dictionary gives you more than just definitions of words. A dictionary tells you how to spell, divide, and pronounce a word and what part of speech it is, such as a noun or an adjective. A dictionary can be accessed on the Internet or in book form.

Medical Dictionary It is nearly impossible for even the most experienced healthcare professional to be familiar with every medical term and its correct spelling. So a medical dictionary will serve as a handy reference for terms with which

you are unfamiliar or about which you would like more information. Like a regular dictionary, a medical dictionary can also be accessed on the Internet or in book form. However, a medical dictionary in book form may not have the most updated terms. Like other medical reference books, a medical dictionary needs to be replaced periodically. Becoming familiar with some of the prefixes, suffixes, and word roots commonly used in medical terms can help you understand the meanings of many words. Appendix I *Prefixes, Suffixes, and Word Roots in Commonly Used Medical Terms* at the end of this textbook lists some common medical word parts.

Thesaurus A thesaurus provides synonyms, or words that are similar in meaning to a word you are using. It helps you avoid repetition in your writing and helps you find a word for an idea you have in mind. A thesaurus can be found in word processing programs, in print, and online.

Physicians' Desk Reference (PDR) The *PDR* is a dictionary of medications. Published yearly, it provides up-to-date information on both prescription and nonprescription (also known as over-the-counter, or OTC) drugs. Consult the *PDR* for the correct spelling of a particular drug or for other information about its usage, side effects, contraindications, and other information.

English Grammar and Usage Manuals These manuals answer questions concerning grammar and word usage. They usually contain sections on punctuation, capitalization, and other details of written communication.

Word Processing Spell-Checkers Most word processing programs used in medical offices have built-in spell-checkers. There are also programs designed specifically to check spelling in medical documents. These spell-checkers include most common medical terms that would not be found in a regular software program. Always keep in mind that spell-checkers should not be relied on as the only means of checking a document, as they may not detect all spelling errors. Spell-checkers will not find correctly spelled words that are used incorrectly, and this type of mistake will reflect negatively on the practice. For example, if you type the word *form* instead of *from*, most spell-checkers will not recognize this as incorrect because *form* is also a correctly spelled word. Although, if the grammar setting is active in Word, it can catch incorrect grammar in some cases but like spell-checkers, should not be relied upon.

Spell-checkers do pick up many spelling errors and often give suggestions for correct spellings. If you indicate the choice you meant to input, the program automatically replaces the misspelled word. You may be able to add words—like medical terms—that are not currently recognized by the spell-checker in your computer. A word of caution is important here! Before you add the word to the computer's dictionary, be sure to look up the exact spelling in a medical dictionary. The computer will recognize only the spelling you add. If you place the *wrong* spelling in the computer, your spell-checker will not correct it.

When you type e-mails, take special care to use correct grammar and punctuation. Spell-checkers are available in most e-mail programs and should be used once you have finished writing the e-mail, before you hit "Send." Note that some e-mail spell-checkers do not automatically point out mistakes as you type.

Some software packages offer grammar-checking and style-checking features. These programs can identify certain problems, but the person using them still must know basic grammar and style rules in order to correct errors.

Edition Process

The editing process ensures that a document is accurate, clear, and complete; organized logically; and written in an appropriate style. It is a good idea, when possible, to leave some time between the writing and editing stages so that you can look at the document in a fresh light. As you edit, you must examine language usage, content, and style.

Language Usage Make sure all sentences are complete. Continually ask yourself, "Is this the best way to convey what I want to say? Do my word choices reflect the overall tone of the document?" For example, in a business letter, you would avoid choosing phrases that are too casual such as "Thanks a million" or "Take it easy." These expressions are informal and inappropriate for a business letter.

Content A business letter should contain all the necessary information the writer intends to convey. If you are editing someone else's letter and something appears to be missing, check with the writer. She or he may have omitted information by mistake.

The content of a letter should follow a logical thought pattern. Place related thoughts and ideas in paragraphs, with one paragraph for each thought or idea. A paragraph should include the message you want to convey and any supporting information. When you start a new thought, start a new paragraph as well. Create a clean, concise letter by

- Stating the purpose of the letter in the first sentence.
- Discussing one topic at a time.
- Changing paragraphs when you change topics or ideas.
- Listing events in chronological order.
- Sticking to the subject.
- Selecting words carefully.
- Reading over what you have written before printing.

Style Use a writing style that is appropriate to the reader. A letter written to a patient is likely to require a different style than one written to a physician. Consider medical terms, for example. In writing to a patient to confirm her surgery date, you might say, "The surgery to remove your gallbladder is scheduled for Friday, May 8, at 7 a.m." However, when confirming the same surgery with the physician, you would state, "Mrs. Stark's cholecystectomy is scheduled for Friday, May 8, at 7 a.m."

Proofreading

Proofreading involves thoroughly checking a document for errors in formatting, data, and grammar. Ideally, after you proofread the document, also have a coworker proofread your work. Someone else will often notice errors that you may have missed. The three types of errors that can occur when preparing a document are formatting, data, and mechanical.

Formatting Errors These errors involve the positioning of the various parts of a letter. They may include errors in indenting, line length, or line spacing. To avoid these errors, take the following two steps:

1. Scan the letter to make sure that the indentions are consistent, that the spacing is correct, and that the text is centered from left to right and top to bottom.
2. Follow the office style consistently throughout the document.

Data Errors Data errors involve mistyping monetary or other figures, like the balance on a patient statement. Mistyped monetary figures can have huge repercussions for the office, the insurance company, and the patient. Other figures, such as test results, must also be absolutely accurate. For example, look again at the first paragraph in Figure 10-6. If the medical assistant had accidentally typed “299” instead of “200” for the second figure, the sentence would not make sense. Be sure to verify the accuracy of all figures by checking them twice or by having a coworker check them.

Mechanical Errors Mechanical errors are errors in spelling, grammar, punctuation, spacing between words, and division of words. Make sure that your word processing spell-checker includes a medical terminology dictionary; otherwise, medical terms may be overlooked. Mechanical errors also include reversing words or characters, typing them twice, or omitting them altogether. Here are some tips to help you avoid mechanical errors.

- Learn basic grammar rules (refer to Tables 10-1 and 10-2). When in doubt, refer to a grammar handbook or reference manual.
- Learn basic spelling, punctuation, and word division rules. When in doubt, be sure to check a manual on English usage. Review Table 10-2, which outlines some basic rules concerning the mechanics of writing. Table 10-3 lists some of the most commonly misspelled medical terms and other words.
- Check carefully for transposed (misplaced) characters or words.
- Avoid dividing words at the end of a line. Most word processing programs automatically wrap words to the next line, so if you are writing on a computer, word division should not present a problem.

▶ Preparing Outgoing Mail

LO 10.7

After you have created, edited, and proofread a letter, you need to prepare it for mailing. This preparation includes having the letter signed, preparing the envelope, and folding and

inserting the letter into the envelope. Your letter will then be ready for postage to be calculated and affixed.

Signing Letters

After your letter is complete—it has been proofread and the envelope and enclosures have been prepared—it is ready for signing. Some physicians authorize other staff members to sign for them. If you have been authorized to sign letters, you should sign the doctor’s name and place your initials after the doctor’s signature.

If the physician prefers to sign all letters, you should place the letter on her desk in a file folder marked “For Your Signature.” If the letter is of an urgent nature, give it to the doctor as soon as possible. Otherwise, you can collect several letters in the folder and present the entire group for signing at one time. However, all prepared work should be given to the physician at the end of the day. Make sure that all enclosures are included with the letter and that they remain with the letter when it is returned to you with the physician’s signature.

Using a Letter-Folding and Inserting Machine

Large offices and hospitals often have letter-folding equipment, which can help minimize the amount of time staff spends preparing large volumes of outgoing mail. Letter folders are also used for creating folded brochures. In addition to folding letters, a medical practice may use folding and inserting machines for a variety of items, including invoices, newsletters, checks, statements, letters, and flyers.

Lower-end folding equipment requires letters to be fed manually. The speed of this machine is limited to the speed at which an individual can feed in letters, which is typically about 200 pieces per hour. An automatic feeder is required for faster folding. Letter-folding machines can make many different types of folds—for example, standard business letter folds (c-fold), accordion folds (z-fold), single folds, right-angle folds, brochure or gate folds, and other folds (Figure 10-10). Most machines can fold more than one sheet of paper together but do not allow stapled pages to be fed and folded.

Many special features are available that may help the processing of mail and brochures. Batch counters and stackers help to prevent a letter-folding machine from folding more sheets than desired. A jogger helps align stacks of paper and dissipates or removes static electricity. Some machines are better designed for certain types of paper, like glossy or carbonless paper. Inserters are used to insert a folded document into an envelope.

Manually Folding a Letter

A business letter is folded twice into horizontal thirds to fit easily into a prepared standard business envelope. Be sure to include any enclosures that have been noted within the letter at the time it is being folded. See Figure 10-11 for more

**FIGURE 10-10** Examples of different folds available with folding machines.

detailed instructions on how to manually fold and insert a business letter into an envelope.

Letters and invoices must be folded neatly before they are inserted into the envelopes. The proper way to fold a document depends on the type of envelope into which the letter will fit.

- With a small envelope, fold the enclosure in half lengthwise and insert it.
- With a regular, business-size envelope, fold the letter in thirds. Fold the bottom third up first, then the top third down, and insert the letter.
- With a window envelope, use an accordion fold. Fold the bottom third up. Then, fold the top third back so the address appears in the window, and insert the enclosure.

Preparing the Envelope

To ensure the quickest delivery of mail, the USPS has issued several guidelines for preparing envelopes. The USPS uses electronic **optical character readers (OCRs)** to help speed mail processing. OCRs read the last two lines of an address and sort the mail accordingly. To take advantage of this technology, envelopes must be no smaller than $3\frac{1}{2} \times 5$ inches and no larger than $6 \times 11\frac{1}{2}$ inches. They must be addressed in a specific format that can be read by the OCR, following USPS guidelines for addressing envelopes.

Address Placement The address must be placed in a certain location on the envelope for reading by the OCR (Figure 10-12). The area the OCR can read has the following characteristics:

FIGURE 10-11 Correct folding of a business letter.

FIGURE 10-12 Correct address format and placement to allow processing by USPS electronic equipment.

- It is bordered by a 1-inch margin on both the left and right sides of the envelope.
- It has a 5/8-inch margin on the bottom. The top of the city-state-zip code line (the last line in the address block) must be no higher than 2 inches from the bottom edge of the envelope.
- An area 4½ inches wide in the bottom right corner of the envelope should be left clear. The OCR reads the address and prints a bar code that corresponds to the zip code in this area.

Two Delivery Addresses Some locations have two delivery addresses, a post office box and a street address. The mail is delivered to the address that appears directly above the city-state-zip (Figure 10-13). If the two addresses have different zip codes, the zip must be the one of the actual delivery point.

Address Format When you enter an address, follow these formatting guidelines:

- Enter the address. The OCR cannot read handwriting or fancy script fonts. Use a plain font, such as Tahoma, Times New Roman, Courier New, or Arial Black.
- Single-space the lines and use the block format. Use only one or two spaces between numbers and words in the address. Do not punctuate, because punctuation is difficult for scanners to read.
- Use only USPS-approved abbreviations for location designations, as presented in Table 10-4.
- Put the addressee's name on the first line of the address block, the department (if any) on the second line, and the company name on the third line. If the letter is to go to someone's attention at a company, per USPS OCR guidelines, put "Attention:" and the person's name on the first line, followed by the company name on the second line before the address begins.
- The line above the city, state, and zip code should contain the street address or post office box number. Include suite or apartment numbers on the same line as the street address.
- The last line of the address must include the city, state, and zip code. Use the zip + 4 code whenever possible.
- Include the hyphen in the zip + 4 code, for example, 08520-6142.
- Obtain current zip codes by logging on to the USPS website at <http://zip4.usps.com>.
- Insert any delivery notations (such as SPECIAL DELIVERY, CERTIFIED, or REGISTERED) two lines below the postage in all-capital letters. This information should appear outside the area the OCR can read.
- Enter any handling instructions (such as PERSONAL or CONFIDENTIAL) three lines below the return address. This information should also be outside the area the OCR can read.
- Letters going to foreign countries should have the name of the country on the last line of the address block in all-capital letters.

FIGURE 10-13 When both street address and PO box are listed, delivery is dependent upon the information on line 3, or directly above the city-state-zip.

TABLE 10-4 USPS Abbreviations

Expressway	EXPY	West	W
Highway	HWY		

Some letters may be appropriate for interoffice or company mail systems. These letters are usually placed in a large envelope with multiple address lines. The envelope can be reused many times by crossing out the previous name and address and using the next line. Place interoffice mail in a specially designated area or basket for pickup. Be sure not to mix it with outgoing mail.

► Mailing Options LO 10.8

Not too long ago, there was one option for delivering correspondence or documents from one location to the other—the US Post Office. Today, aside from electronic delivery options, there are multiple ways to deliver correspondence and documents from one location to the other. Let's explore some of these options.

Mailing Equipment and Supplies

The proper equipment and supplies will help you handle the mail efficiently and cost effectively. In addition to letterhead, blank stationery for multipage letters, and envelopes described earlier in the chapter, you will need some standard supplies. The USPS provides forms, labels, and packaging for

items that need special attention, like airmail, Priority Mail[®], Priority Mail Express[™] certified mail, or registered mail. Private delivery companies, like United Parcel Service (UPS) and Federal Express (FedEx), also provide shipping supplies to their customers.

Airmail Supplies In the past, any piece of mail that was transported by air was designated as airmail. Today, nearly all first-class mail outside a local area is routinely sent by air. However, airmail services are still available for some packages and for most mail going to foreign countries.

If you are sending an item by airmail, attach special airmail stickers, available from the post office, on all sides. (The word *AIRMAIL* can also be neatly written on all sides.) Special airmail envelopes for letters can be purchased from the USPS.

Envelopes for Overnight Delivery Services For correspondence or packages that must be delivered by the next day, a number of overnight delivery services are available through the USPS and private companies. Most companies require the use of their own envelopes and mailing materials. Make sure you keep adequate supplies on hand.

Postal Rates, Scales, and Meters Postal rates and regulations change periodically, and every medical office should have a copy of the latest guidelines—available from the USPS. The *Office Equipment and Supplies* chapter describes postal scales and meters.

Posting Mail

As stated previously, before you begin posting mail, make sure the envelope or package is complete with all noted enclosures and materials included. After inserting the document(s) in the appropriate envelope (or package in the appropriate container), apply the proper postage and place the postmarked envelope or package in the area of your office designated for mail pickup.

US Postal Service Delivery

The USPS offers a variety of domestic and international delivery services for letters and packages. As a result of a comprehensive USPS Transformation Plan in 2002, many new services were added to the post office to compete with other mail and package delivery services. Following are some of the services you will most likely use in the medical office setting.

Regular Mail Service Regular mail delivery includes several classes of mail as well as other designations like Priority Mail[®] and Priority Mail Express[™]. The class or designation determines how quickly a piece of mail is delivered.

First-Class Mail Most correspondence generated in a medical office—letters, postcards, and invoices—is sent by first-class mail. Items must weigh 11 ounces or less to be considered first-class. (An item over 11 ounces that requires quick delivery must be sent by Priority Mail[®], which is discussed later in this section.) The cost of mailing a first-class item is based on its weight. The standard rate is for items 1 ounce or

less that are no larger than 6½ inches high, 11½ inches wide, and ¼ inch thick. Additional postage is required for items that are heavier or larger. Postage for postcards is less than the letter rate. First-class mail is forwarded at no extra cost.

Media Mail (Third-Class Mail) Media mail is also known as book rate mail. Like second-class mail, it is not often used in medical offices. Media mail is used for the mailing of books, catalogs, and other printed material that weighs less than 70 pounds. The “media” must be educational print material. CDs and digital USB drives cannot be sent by media mail, even if they contain educational material.

Parcel Post This type of mail was formerly called Parcel Post or Fourth-Class Mail. It is used for items that weigh at least 1 pound but not more than 70 pounds and have a combined length and width of not more than 130 inches. Standard post is used for items that do not require speedy delivery. Rates are based on weight and distance. There is a special fourth-class rate for mailing books, manuscripts, and some types of medical information.

Priority Mail[®] Priority class is useful for heavier items that require quicker delivery than is available for Standard Post. Any first-class item that weighs up to 70 pounds requires Priority Mail[®] service. Although the rate for Priority Mail[®] varies with the item’s weight and the distance it must travel, the USPS offers a flat rate for all material that can fit into its special Priority Mail[®] envelopes and boxes, regardless of weight (up to 70 pounds). The USPS guarantees delivery of Priority Mail[®] items in 1 to 3 business days. Most Priority Mail[®] is tracked using the USPS Tracking system.

Priority Mail Express[™] This is the quickest USPS service. With some exceptions, Priority Mail Express[™] guarantees overnight delivery. Priority Mail Express[™] deliveries are made 365 days a year. Rates vary, depending on the weight and the specific service. A special flat-rate envelope is also available. Items sent by Priority Mail Express[™] are automatically insured against loss or damage. You can drop off packages at the post office or arrange for pickup service.

Special Postal Services The USPS offers a variety of special mail delivery services in addition to the regular classes of mail. These services may require an additional fee above and beyond postage costs.

Online Postage Postage can now be purchased online by using USPS-approved software. Pitney Bowes has software called ShipStream[™]; however, you may search the Internet for other USPS-approved software. The USPS website, <http://www.USPS.com> also sells postage online as well as other shipping and mailing supplies.

Certified Mail Certified mail offers a guarantee that the item has been received. The item is marked as certified mail and requires the postal carrier to obtain a signature on delivery (Figure 10-14). The signature card is then returned to the sender. The card should be added to the patient’s file. When

FIGURE 10-14 Certified mail with return receipt guarantees receipt of correspondence or package sent to the addressee.

combined with return receipt, this documentation is evidence that the document was not only mailed but also received. The receiver's name is clearly printed along with the signature. The certified mail signature card becomes a legal document, which may be important in court.

Return Receipt Requested You may request a return receipt (for a small additional fee) to obtain proof that an item was delivered. The receipt indicates who received the item and when. This type of mail service, which is often combined with Certified Mail, is very important when a medical practice requires proof that a letter was received. When returned to the office, the return receipt should be carefully added to the patient's record. It may become an important legal document—required at a later date in a court of law.

Registered Mail Use registered mail to send items that are valuable, irreplaceable, or otherwise important. Registered mail provides the sender with evidence of mailing and delivery. It also provides the security that an item is being tracked as it is transported through the postal system.

You can register a piece of mail online, at the post office, or through a mail carrier, but you must present it for mailing to a postal employee. Indicate the full value of the item. Both first-class mail and Priority Mail® can be registered.

International Mail The USPS offers both surface (via ship) and airmail service to most foreign countries. Information on rates and fees is available from the post office.

There are various types of international mail, which are similar to the domestic classes. The USPS provides Priority Mail Express International®, Priority Mail International®, First-Class Mail International®, First-Class Package International Service®, and Airmail M-Bags™. Special mail delivery services, such as registered mail, certified mail, and special delivery, are also available.

Tracing Mail If a piece of registered, certified, or tracked mail does not reach its destination by the expected time, you can ask the post office to trace it (Figure 10-15). You will need to present your original receipt for the item. You can also trace mail on the Internet through a UPC symbol that is scanned at the post office.

Other Delivery Services

In addition to the USPS, other companies provide mail and package delivery services around the globe. UPS, FedEx, and DHL are three of the largest and most popular of these companies; DHL is the newest of the three.

All three services deliver packages and provide overnight letter and express services. Packages can be dropped off at drop-off locations or at drop boxes (often located near post offices), or they can be picked up at your office. Locations of both can be found online or in the phone book. Fees depend on the service(s) provided, such as ground or air, and may vary among companies. Each company also offers express delivery services with rates varying according to weight, time of delivery, and whether you use office pickup or drop the package off at one of the company's local branches. Packages sent using

FIGURE 10-15 Items sent by registered or certified mail can be traced by the USPS if delivery is not made as expected.

© Paul Bradbury/Getty Images RF

any of these private companies are automatically insured for a minimum amount (usually \$100) against theft or damage. Additional insurance can be purchased from these companies if the value of the package exceeds the standard limit.

Messengers or Couriers Before e-mail and options like FedEx and UPS were widely used, local messenger or courier services were popular for deliveries made within a local area. Except for interoffice couriers that are still used by some large organizations—like hospitals with multiple satellite locations—fewer courier services are now available for hire. Such courier services are listed in the telephone book's Yellow Pages or can be researched online.

▶ Processing Incoming Mail

LO 10.9

Mail is an important connection between the office and other professionals and patients. An office often has an established procedure for handling the mail. It is best to set aside a specific time of the day to process all the incoming mail at once rather than trying to do a little bit at a time. Although it sounds simple, processing mail involves more than merely opening envelopes. In general, it involves the following steps: sorting, opening, recording, annotating, and distributing.

Sorting and Opening

The first step in processing mail is to sort it. Always sort the mail in an uncluttered area to avoid mixing it with other paperwork. As you sort, place any personal or confidential mail aside. Unless

you have special permission, never open personal mail addressed to another person. Instead, carefully place it on the addressee's desk, unopened. Sort the remaining mail according to priority. Follow a regular sorting procedure each time to avoid missing any steps. Procedure 10-5, found at the end of this chapter, outlines suggested steps for sorting, opening, and prioritizing the mail. In general, any item arriving by courier, special delivery, overnight mail, or certified or registered mail would be considered a high-priority item, but as always, sort the mail according to the procedure outlined in the office policies and procedures manual.

Recording

Keep a log of each day's mail. This daily record lists the mail received and indicates follow-up correspondence and the date correspondence is completed. This method helps in tracing items and keeping track of correspondence.

Annotating

Because you will be reading much of the incoming mail, you also may be encouraged to **annotate** it. To annotate means to underline or highlight key points of the letter or to write reminders, comments, or suggested actions in the margins or on self-adhesive notes. An example of annotating is including "please sign here" next to where a signature should be. Annotating may involve pulling a patient's chart or any previously received, related correspondence from a file and attaching it to the letter.

Distributing

Once you have reviewed the mail and made any necessary annotations, sort the letters into separate batches for distribution. These batches might include correspondence

that requires the physician's attention, payments to be directed to the billing supervisor, and correspondence that requires your attention. Each batch should be presented to the appropriate person in a file folder and arranged with the highest-priority items on top. You may be given specific instructions on how to distribute magazines, newspapers, and advertising circulars.

Handling Drug and Product Samples

Many physicians receive a number of drug and product samples in the mail. Handling procedures vary from office to office. Samples of nonprescription products, like hand creams or cough drops, may be placed in the patient treatment area for patient distribution, as directed by the physician.

The physician may ask that you put samples of any new prescription drugs in his private office for him to evaluate. Store all other drug samples in a locked cabinet reserved solely for such samples. Sort and label the samples by category, such as antibiotics, sedatives, painkillers, and so on. Never give samples to patients or use them yourself unless directed by the physician. If the physician directs you to give samples to a patient, make sure to write this information in the patient's chart and date the entry.

When a box of samples is outdated, you should properly dispose of them, following all state and DEA regulations. You will most likely use the disposal company that handles your biomedical waste to dispose of unused, outdated sample medications. Flushing samples down the sink or toilet is no longer allowed, as this can pollute the environment. Samples should never be placed in the trash where unauthorized individuals could take the medications. Your local pharmacy may also have a program for disposing of outdated medications.

PROCEDURE 10-1 Creating a Professional Letter

WORK // DOC

Procedure Goal: To follow standard procedure for constructing a business letter

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Computer with appropriate word processing software, letterhead paper, dictionaries or other professional tools

Method:

1. Format the letter according to the standard office procedure. Use the same punctuation and style throughout.

RATIONALE: *Consistency in format creates a professional-looking document.*

2. Start the dateline three lines below the last line of the printed letterhead. (Note: Depending on the letter's length, it is acceptable to start between two and six lines below the letterhead.)

RATIONALE: *The letter should be centered both vertically and horizontally on the page for visual appeal.*

3. Two lines below the dateline, enter any special mailing instructions (such as REGISTERED MAIL, CERTIFIED MAIL, and so on).

4. Three lines below any special instructions, begin the inside address. Insert the addressee's courtesy title (Mr., Mrs., Ms.) and full name on the first line. If a professional title is given (MD, RN, PhD), this title is placed after the addressee's name instead of a courtesy title.

RATIONALE: *A professional title is used when available in professional correspondence. Never use both a courtesy title and a professional title at the same time.*

5. Enter the addressee's business title, if applicable, on the second line with the company name on the third line. The street address is entered on the fourth line, including the apartment or suite number. The city, state, and zip code appear on the fifth line. Use the standard two-letter abbreviation for the state, followed by one space and the zip code.

6. Two lines below the inside address, insert the salutation, using the appropriate courtesy title (Mr., Mrs., Ms., Dr.) prior to the addressee's last name.

RATIONALE: *The salutation uses a courtesy title. Do not include the professional title or the addressee's first name in the salutation.*

7. Two lines below the salutation, enter the subject line, if applicable.
8. Two lines below the subject line, begin the body of the letter. Single-space between lines. Double-space between paragraphs.
9. Two lines below the body of the letter, enter the complimentary closing.
10. Leave three blank lines (return four times) and begin the signature block. (Enough space must be left to allow for the signature.) Enter the sender's name on the first line and type the sender's title on the second line.
RATIONALE: *Adequate space must be left for the signature. If the signer has a long signature, more than three blank lines may be left. Entering the name allows the addressee to understand who sent the letter if the sender's signature is not legible.*
11. Two lines below the sender's title is the identification line. Insert the sender's initials in all capitals and your initials in lowercase letters, separating the two sets of initials with a colon or a forward slash.
12. One or two lines below the identification line, add the enclosure notation, if applicable.
13. Two lines below the enclosure notation, insert the copy notation, if applicable.
14. Edit the letter.
RATIONALE: *Make appropriate changes to clarify the meaning of the letter.*
15. Proofread and spell-check the letter.
RATIONALE: *Every letter must be read again to ensure there are no errors.*

PROCEDURE 10-2 Writing an Interoffice Memo

Procedure Goal: To follow standard procedure for writing an interoffice memo

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Computer with appropriate word processing software, plain paper, dictionaries or other professional references as needed

Method:

1. Gather all necessary materials and documents needed to compose the memo.
2. Decide whether the memo will be created "freehand" or with an existing template.
RATIONALE: *If a template is to be used, it must be pulled up using the appropriate computer or EHR software prior to composing the document.*

3. If using a template, fill in the headings as listed with the appropriate information. If the memo is being created freehand, use the headings DATE:, TO:, FROM:, and RE: or SUBJECT:. Fill in each heading with the appropriate information.
4. Double- or triple-space after the memo headings or, if using a template, move to the body area of the memo and begin entering the information to be included in the memo.
5. Single-space the information within the memo and double-space between paragraphs. Use either the block or the indented paragraph format, depending on office policy.
6. Spell-check and proofread the document carefully, correcting errors as necessary.
RATIONALE: *All professional documents must be perfect to reflect well on the writer and the office.*

PROCEDURE 10-3 Composing a Professional E-mail Message

Procedure Goal: To follow standard procedure for writing a professional e-mail message

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Computer with e-mail (Internet) capabilities, dictionary or other professional references as needed

Method

1. Verify that the patient's medical record contains a signed "Consent to Use E-mail" form, allowing communication by this method.
RATIONALE: *Because e-mail is not a secure form of communication, the office must have written approval to use this form of communication with the patient.*

2. Use a classic, easy-to-read font such as Times New Roman or Arial at 12–14 pt. Use black text only.
RATIONALE: *Larger, crisp fonts are easy to read. Black text lends a professional appearance.*
3. If responding to a patient e-mail, open the e-mail and choose "Reply." If composing a new message, choose "New" to open a new e-mail document. Carefully enter the patient's e-mail address.
RATIONALE: *It is imperative that the correct person receives the e-mail.*
4. Add the e-mail address to the office address book for easy reference, if it is not saved in the office EHR program.

5. If answering a patient e-mail, you may keep the subject line from the original message. If you are writing a new e-mail, enter a descriptive subject line.

RATIONALE: *The subject line gives the receiver an idea of what the e-mail pertains to.*

6. Insert a salutation, using the patient's surname as you would with an ordinary letter.
7. Compose the body of the message, aligning the information with the left margin.
8. Double-space at the end of the message and enter your name, including a signature line with the practice information, and a phone number.

RATIONALE: *It is important that the patient can easily reach you by methods other than e-mail if needed. Including the office information and phone number makes this easier for the patient.*

9. Spell-check and proofread the message carefully for any errors.

RATIONALE: *Even though e-mail is considered less formal, you still represent the office, and the document must be professional in tone and free of errors.*

10. Click "Send" and wait for the message informing you the message has been sent.
11. If the message is returned as undeliverable, verify that the e-mail address was entered correctly. If necessary, correct the address and attempt delivery again.
12. If the message is returned a second time as undeliverable, contact the patient by phone or an alternate communication method to be sure that he or she receives the required information.

PROCEDURE 10-4 Composing an Electronic Patient Letter

Procedure Goal: To create and send an electronic letter to a patient using EHR software

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: EHR software program with letter templates, information necessary to compose the letter, dictionary or other professional references as needed

Method:

1. After verifying that there is a signed "Consent to Use E-mail" in the patient's record, access the *New* menu in the appropriate screen of the software program. Choose *New Letter Template*.
2. In the *RE:* window, insert the subject line, such as "Welcome to BWW Medical Associates, PC."
RATIONALE: *The name gives the recipient an idea of what is included in the e-mail message.*
3. In the Text box, enter the body of the letter. Begin the letter with an introductory statement, such as "Welcome to BWW Medical Associates, and thank you for choosing us for your healthcare needs. We look forward to working with you."
Enter all pertinent information required for the letter. If continuing a "welcome to the practice" letter, be sure to include the practice name, address, phone numbers, and website information, as well as names of the medical staff, office personnel, and office hours.

4. When you complete the letter, give the template an easily identifiable name, such as *Welcome New Patient Letter*.

RATIONALE: *This makes it easy for all users to identify each template.*

5. Enter the appropriate patient's medical record. Select the *New* menu and choose the letter template you just created. Because you are in the patient's medical record, most software programs will automatically enter the patient's address in the inside address section of the letter. The standard greeting and closure also should be inserted from the medical record. Check to be sure the information listed is correct.
RATIONALE: *Even though this is an electronic letter, the professional format remains the same as a written letter mailed to the patient. All information must be correct.*
6. Add a signature to the letter's signature block by using the "Sign" icon within the EHR program. Choose the correct provider/staff member from the drop-down list and verify that the correct signature is inserted.
7. If the signed "Consent to use E-mail" is in the patient's chart, the letter may be sent by clicking "Send." If the consent is not signed, print the letter and send it to the patient via USPS.
RATIONALE: *Without a signed consent, e-mail is not an approved communication between the patient and medical office.*
8. Be sure to click "Save" or "Done" depending on the EHR software used, so that the template is saved for future use.

PROCEDURE 10-5 Sorting and Opening Mail

Procedure Goal: To follow a standard procedure for sorting, opening, and processing incoming office mail

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Letter opener, date and time stamp (manual or automatic), stapler, paper clips, and adhesive notes

Method:

1. Check the address on each letter or package to be sure that it has been delivered to the correct location.

2. Sort the mail into piles according to priority and type of mail. Your system may include the following:
 - Top priority. This pile will contain any items that were sent for overnight delivery, in addition to items sent by registered or certified mail delivery. (Faxes and e-mail messages are also top priority.)
 - Second priority. This pile will include personal or confidential mail.
 - Third priority. This pile will contain all first-class mail, airmail, and Priority Mail® items. These items should be divided into payments received, insurance forms, reports, and other correspondence.
 - Fourth priority. This pile will consist of packages.
 - Fifth priority. This pile will contain magazines and newspapers.
 - Sixth priority. The last pile will include advertisements and catalogs.
3. Set aside all letters labeled “Personal” or “Confidential.” Unless you have permission to open these letters, only the addressee should open them.
4. Arrange all the envelopes with the flaps facing up and away from you.
5. Tap the lower edge of the envelope to shift the contents to the bottom. This step helps to prevent cutting any of the contents when you open the envelope.
6. Open all the envelopes.
RATIONALE: *It is more efficient to open all the envelopes first and then remove the contents.*
7. Remove and unfold the contents, making sure that nothing remains in the envelope.
8. Review each document and check the sender’s name and address.
 - If the letter has no return address, save the envelope, or cut the address off the envelope, and tape it to the letter.
 - Check to see if the address matches the one on the envelope. If there is a difference, staple the envelope to the letter and make a note to verify the correct address with the sender.
9. Compare the enclosure notation on the letter with the actual enclosures to make sure that all items are included. Make a note to contact the sender if anything is missing.
10. Clip together each letter and its enclosures.
11. Check the date of the letter. If there is a significant delay between the date of the letter and the postmark, keep the envelope.
RATIONALE: *It may be necessary to refer to the postmark in legal matters or cases of collection.*
12. If all contents appear to be in order, you can discard the envelope.
13. Review all bills and statements.
 - Make sure the amount enclosed is the same as the amount listed on the statement.
 - Make a note of any discrepancies.
14. Stamp each piece of correspondence with the date (and sometimes the time) to record its receipt. If possible, stamp each item in the same location, such as the upper-right corner.
RATIONALE: *It may be necessary to refer to the date in legal matters or in cases of collection.*

S U M M A R Y O F L E A R N I N G O U T C O M E S	
LEARNING OUTCOMES	KEY POINTS
10.1 Explain why well-written documents are important to the image of the medical practice.	Well-written, neatly prepared documents are one of the most important means of communicating a professional image for the medical practice.
10.2 Describe the types of document supplies that will be used in a medical office.	Document supplies used in a medical office include letterhead and matching plain bond paper; matching envelopes for professional correspondence; lesser bond envelopes of varying sizes for other types of correspondence; padded envelopes and data mailers; and labels and statements.
10.3 Outline the general guidelines to effective writing.	Know the type of person to whom you are writing. Know the purpose of the letter and be concise, brief, and specific in meeting that purpose, using clarity in the writing. Use active voice whenever possible, being polite and courteous. Check spelling, grammar, and accuracy. Avoid leaving “widows and orphans.”
10.4 List and explain the purpose of different types of documents used in a medical office.	The different types of documents and correspondence used in a medical office include letters of referral; letters about scheduling, canceling, or rescheduling appointments; patient reports for

LEARNING OUTCOMES	KEY POINTS
	insurance companies; instructions for examinations or laboratory tests; answers to insurance or billing questions; and cover letters or form letters to order supplies, equipment, or magazine subscriptions. Also, internal documents like memos may be used to provide staff information.
10.5 Explain why it is important to have a signed written consent from the patient for e-mail communications.	All patient information, regardless of the form, is protected by HIPAA law and is to be guarded by the healthcare provider. E-mail is not considered a secure method of communication because information can be intercepted and received by someone who is not the intended recipient. Before undertaking e-mail communication with a patient, a signed written consent for e-mail communication must be on file.
10.6 Describe the tasks involved in editing and proofreading a document.	Editing involves checking a document for factual accuracy, logical flow, conciseness, clarity, and tone. Proofreading involves checking a document for grammatical, spelling, and formatting errors.
10.7 Outline the steps for preparing a completed letter for mailing.	After you have created, edited, and proofread a letter, it must be prepared for mailing. This preparation includes having the letter signed, preparing the envelope, and folding and inserting the letter into the envelope. Be sure to include any enclosures noted in the letter when folding it for insertion into the envelope.
10.8 Explain the differences among the types of mail services offered by the USPS.	The mail delivery options offered by the USPS include certified mail, return receipt requested, registered mail Priority Mail®, Priority Mail Express®, and delivery confirmation.
10.9 Describe the steps involved in processing incoming mail.	The steps involved in processing incoming mail include sorting and opening, recording, annotating, and distributing.

CASE STUDY CRITICAL THINKING

© McGraw-Hill Education

Recall Valarie from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding her case.

1. Valarie's lab results and chest X-ray come back showing no acute pathology. You are to compose a letter to her per Dr. Buckwalter stating her

results are normal and she should call the office for a flu shot when she feels better.

2. You have a "Consent to Use E-mail Communication" on file for this patient. Draft a short e-mail to her about her lab and chest X-ray results, requesting she contact the office by phone or e-mail to set up an appointment to receive a flu shot.

EXAM PREPARATION QUESTIONS

1. (LO 10.4) The _____ is the space around the edges of a form or letter that is left blank.
 - a. Dateline
 - b. Courtesy title
 - c. Letterhead
 - d. Margin
 - e. Indentation
2. (LO 10.4) The complimentary closing is placed how many lines below the last line of the body?
 - a. 2
 - b. 6
 - c. 4
 - d. 3
 - e. 5

3. (LO 10.8) What type of USPS mail service should be utilized to verify that the patient has received the document?
 - a. Registered
 - b. Certified
 - c. Standard Post
 - d. Certified with return receipt
 - e. Media mail
4. (LO 10.6) Which of the following is spelled correctly?
 - a. Professor
 - b. Proffessur
 - c. Profesur
 - d. Profesor
 - e. Proffesor
5. (LO 10.3) Which of the following is an example of a linking verb?
 - a. Ran
 - b. Review
 - c. Be
 - d. Try
 - e. Type
6. (LO 10.9) Marking incoming mail to note important points for the recipient is called
 - a. Opening
 - b. Sorting
 - c. Recording
 - d. Annotating
 - e. Distributing
7. (LO 10.4) Which letter format places the date, complimentary close, and signature block just to the right of center?
 - a. Block
 - b. Modified block
 - c. Modified block with indented paragraphs
 - d. Simplified
 - e. Memo
8. (LO 10.5) Why is written consent required before using e-mail to communicate with a patient?
 - a. The patient may not have a computer
 - b. You must be sure you have a current e-mail address
 - c. Parents may restrict e-mail use for their teenagers
 - d. If the patient is not expecting e-mail from the office, it may be considered SPAM
 - e. E-mail is not a secure form of communication
9. (LO 10.4) Which document format is traditionally used for interoffice communication?
 - a. Simplified letter
 - b. Block letter
 - c. Modified-block letter
 - d. Memo
 - e. All of these
10. (LO 10.1) Better bond paper embossed with the practice name, address, and phone number is called
 - a. Bonded
 - b. Letterhead
 - c. Envelope
 - d. Label
 - e. Lettering

Go to CONNECT to see activities about *Creating a Patient Letter*, *Creating a Letter to Referring Physician*, and *Drafting an Email to a Patient*.

SOFT SKILLS SUCCESS

Recall Valarie from the case study at the beginning of the chapter. At the end of her appointment, Valarie asked to receive her test results by e-mail because she finds Dr. Buckwalter “gruff” and “unsympathetic” even though she trusts him.

1. What will you need from Valarie to honor her request to receive communications by e-mail?

2. How should you handle Valarie’s comment about Dr. Buckwalter being “gruff and unsympathetic”?

Go to PRACTICE MEDICAL OFFICE and complete the module Admin: Check In - Privacy and Liability.

CASE STUDY

PATIENT INFORMATION	Patient Name	DOB	Allergies
	Mohammad Nassar	5/17/20XX	NKA
PATIENT INFORMATION	Attending	MRN	Other Information
	Elizabeth H. Williams, MD	423-90-687	Patient recently became sexually active.

Mohammad Nassar is a 16-year-old male who is new to the practice and comes to the office today for his annual physical examination. He has a known past medical history of asthma, which has been relatively stable until recently. He states when he arrives that he has been experiencing an increasing need for his rescue inhaler in the last several days. His

© David Sacks/Getty Images

mother has brought him to the appointment, but Mohammad has asked that she remain in the reception area during his appointment. She does give you a list of Mohammad's current asthma medications and the previously completed new patient documents.

Keep Mohammad (and his mother) in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

 **ACTIVSim**

LEARNING OUTCOMES

After completing Chapter 11, you will be able to:

- 11.1** Explain the importance of patient medical records.
- 11.2** Identify the documents that constitute a patient medical record.
- 11.3** Compare SOMR, POMR, SOAP, and CHEDDAR medical record formats.
- 11.4** Recall the six Cs of charting, giving an example of each.
- 11.5** Describe the need for neatness, timeliness, accuracy, and professional tone in patient records.
- 11.6** Illustrate the correct procedure for correcting and updating a medical record.
- 11.7** Describe the steps in responding to a written request for release of medical records.

problem-oriented medical record (POMR)	

- V.P.1** Use feedback techniques to obtain patient information including:
 - (a) reflection
 - (b) restatement
 - (c) clarification
- V.P.11** Report relevant information concisely and accurately
- VI.C.4** Define types of information contained in the patient's medical record
- VI.C.5** Identify methods of organizing the patients medical record based on:
 - (a) problem-oriented medical record (POMR)
 - (b) source-oriented medical record (SOMR)
- VI.C.6** Identify equipment and supplies needed for medical records in order to:
 - (a) Create
 - (b) Maintain
 - (c) Store
- VI.C.7** Describe filing indexing rules
- VI.P.3** Create a patient's medical record
- X.C.3** Describe the components of the Health Information Portability and Accountability Act (HIPAA)
- X.P.2** Apply HIPAA rules in regards to:
 - (a) privacy
 - (b) release of information
- X.P.3** Document patient care accurately in the medical record
- X.A.2** Protect the integrity of the medical record

3. Medical Terminology

- d. Define and use medical abbreviations when appropriate and acceptable

4. Medical Law and Ethics

- a. Follow documentation guidelines
- b. Institute federal and state guidelines when releasing medical records or information

7. Records Management

- c. Comply with federal, state, and local laws relating to exchange of information and describe elements of meaningful use and reports generated

8. Administrative Procedures

- a. Gather and process documents
- f. Display professionalism through written and verbal communications

► Introduction

In your career as a medical assistant, a major part of your role will be documenting and maintaining patient health (or medical) records. These records detail the evaluation, management, and treatment given to the patient. Patient records are critical to the patient's care. Without accurate and complete patient records, medical care can easily be compromised with the potential for (unintentional) harm to the patient.

Patient health records have many sections that describe individual facets of every patient, including

- Personal information or data.
- Physical and mental conditions.
- Medical history.
- Current medical care.
- Future medical care if the patient is referred to other physicians or for further testing.

In this chapter, you will learn how to carefully manage patient records with the understanding that if the medical care is not documented, in a legal sense, the medical care did not occur at all.

► The Importance of Medical Records

LO 11.1

Patient medical (or health) **records**, also known as **charts**, contain important information about a patient's medical history and present condition. Patient records serve dual roles as communication tools and legal documents. They also play a role in patient and staff education and may be used for quality control and research. Patient records come in paper or electronic format. Adopting electronic health records in lieu of the traditional paper format is extremely common. This chapter will focus on the paper record format and the next chapter,

Electronic Health Records, will focus on the electronic format. Regardless of which format is used, the medical record is initiated by the medical assistant or another staff member and is consistently updated whenever the patient has contact with the office. As stated in the *Legal and Ethical Issues* chapter, it is important to remember that although the medical facility owns the physical record (electronic or paper), the patient owns the information contained within that record as his personal health information. So the patient has control over who may access that information.

The patient health record provides physicians and other medical care providers with all the important information, observations, and opinions recorded about a patient. The healthcare professional can read the complete patient medical history and information about previous treatments and outcomes. With the patient's permission, the information in the records also can be sent to other physicians or healthcare specialists if the patient needs further treatment, changes healthcare providers, or moves to a new location. The information recorded in the medical record provides a "map" or plan to follow for the continuity of patient care. It also serves as supporting documentation for billing and coding purposes, and as a legal document, it is admissible in a court of law. All medical records should include the following general information about the patient:

- Address and phone number
- Occupation
- Medical history
- Current complaint or condition
- Healthcare needs
- Medical treatment plan or services received
- Radiology and laboratory reports (when performed)
- Response to care

Standard paper patient records are usually assembled for new patients well before their actual use. The medical assistant is responsible for making sure adequate patient records are prepared and available to meet the practice's needs.

Legal Guidelines for Patient Records

In addition to being essential documents for patient care management and treatment, patient records are also important for legal reasons. As a general rule, if information is not documented, no one can prove that an event or a procedure took place. Medical records are used in lawsuits and malpractice cases to support a patient's claim of malpractice against a provider, as well as to support the provider in defense against a claim. As stated in the *Legal and Ethical Issues* chapter, legally, medical records must be retained for 7 years (for pediatric records, 7 years from the age of majority, which in most states is age 18). Remember, however, that because the Federal False Claims Act requires patient financial records to be kept for 10 years, many legal experts suggest that medical records also be kept for 10 years. This is because the medical record backs up the information within the financial record.

All medical care, evaluations, and instructions the provider gives to the patient must be documented. **Documentation** is

the process of recording information in the medical record. Because every patient chart is a legal document, every entry must be clear, accurate, legible, dated, and signed. In offices that utilize paper records, some require records to be written in blue ink, so that it is easy to recognize whether the record is an original or a copy. Before making any entry, always consider how the patient record would present if it were called into a court of law for review. Never insert an opinion in a patient medical record. For instance, you would not write in a medical record "The patient appears to be drunk." Instead, "The patient's balance is unsteady and there appears to be the smell of alcohol on his breath." would be appropriate. If you are unsure how to document a situation appropriately, speak to the physician or your supervisor for appropriate guidance. In this case, you might wish to relay your observations to the physician and allow her to make the appropriate documentation.

As discussed in the *Legal and Ethical Issues* chapter, it is also very important to document when a patient is noncompliant. **Noncompliant** is the medical term used to describe a patient who does not follow the medical advice he or she receives. After a clear record has been made of the directions given to a patient for optimum health, it is essential to record the level of patient compliance. For example, after you have instructed a patient on how to collect a 24-hour urine specimen, you would write in her chart "Patient stated she understood all directions regarding collection of 24-hour urine specimen. Written instructions also given to patient." If it is determined that a patient did *not* follow the medical instructions or advice, it is then essential to chart this as well. The physician may wish to withdraw from the care of a patient because of the patient's noncompliance. However, without proper and accurate documentation of the patient's noncompliance, the physician may not be able to withdraw care without becoming legally liable. Additionally, documented noncompliance can be used in the physician's defense in a malpractice suit if it can be proven that, due to patient noncompliance, the physician was not solely responsible for inadequate medical care or results. Please refer to the *Legal and Ethical Issues* chapter for further details on noncompliance and proper steps for withdrawal from patient care.

Standards for Records

Records that are complete, accurate, and well documented can be convincing evidence that a practitioner provided appropriate care. On the other hand, altered, incomplete, inaccurate, or illegible records may imply that the care provided by the practitioner is below standard.

It is important to understand that the licensed practitioners in a practice are not the only people who document (or chart) in the practice medical records. However, it is equally important to remember that under *respondeat superior* (see the *Legal and Ethical Issues* chapter), if an employee of the practice charts inappropriately or inaccurately in a patient's medical record, in a court of law, the practitioner will also be held responsible for that action. For instance, if a medical assistant documents an erroneously high glucose level and the

patient is given too much insulin based on that result and then ends up in insulin shock, the practitioner will be held responsible. All records, both medical and financial, are the physician's responsibility. As the office medical assistant, you are responsible to the patient and the practitioner for both the medical and administrative procedures you perform and the accurate recording of those procedures.

Additional Uses of Patient Records

Patient records serve as ongoing references about individual patients' medical care. They also provide valuable information for patient education, quality of treatment, and research.

Patient Education Patient health records can be used to educate patients about their own conditions and treatment plans. The healthcare provider can point out how test results have changed or how the patient's general health has improved or worsened. The provider can also emphasize the importance of following treatment instructions. The medical assistant may also use some of this information to educate the patient about his condition or its management. Records can also be used to educate the healthcare staff about unusual medical conditions, patient progress, or treatment plan results.

Quality of Care Patient medical records are frequently used to evaluate the quality of care and treatment a facility or specific physician provides. Auditing groups, such as peer review organizations or The Joint Commission (TJC), may review medical records to monitor whether the care provided and the fees charged meet accepted standards. Records also provide statistics for healthcare analysis and future healthcare plans and policy decisions.

Research Medical records also play an important role in medical research. For example, a medical research team may be testing a new antihypertensive drug with volunteers who fit a certain medical category—perhaps men between the ages of 45 and 54 who have high blood pressure. Carefully kept records are valuable sources of data about patient responses, behavior, symptoms, side effects, and outcomes.

Information in charts may spur researchers to begin a study. For example, the records may show that 80% of all patients taking a particular heart medication experience dizziness. Researchers can investigate why this reaction might be happening.

► Contents of Patient Medical Records

LO 11.2

As the office medical assistant, you will fill out a record for each new patient who comes to the office. Although each medical office has its own forms and physical chart type, in general, all medical records must contain certain standard information. This standard chart information covers a variety of carefully detailed notes and facts about a patient, from his medical history to the physician's diagnosis and comments on follow-up care. Let's look at each form in more detail here.

Patient Registration Form

When a new patient makes an appointment with the office, certain basic **demographic** information—specific information required of a population—must be obtained: in this case, the basic information required of all patients seen in the medical practice. Very often, the first document a new patient completes is the registration form. Depending on practice policy, the registration form may be mailed to the patient prior to the first visit with the expectation that the patient will complete it prior to the visit and bring it with her at the time of her first appointment. Some facilities have patients complete their registration online before their first appointment. Other offices ask the patient to arrive for the first appointment 15–20 minutes early and complete the registration form at that time. Although the format may vary from office to office, the information requested in the registration form itself is fairly uniform and generally includes

- Date of current (first) visit.
- Patient's legal name and physical address (PO box may be listed as the mailing address, but the physical address is also required).
- Phone numbers including area code (home, cell, work). E-mail address also may be requested, but written permission must be received prior to e-mailing the patient.
- Patient's date of birth (DOB), sex, marital status, and Social Security number.
- Medical insurance information, employer name/address, and patient occupation.
- Emergency contact name, relationship, and phone number.
- Primary care physician (if specialty office) and referral source.

The completed registration form (with front and back copies of the patient's insurance card) is the base document for each patient's financial record. Patient financial and medical records are separated into two distinct records and are filed separately. Because of the importance of this “base” demographic document, review it carefully when the patient returns it to you to be sure it is filled out completely and properly. Each time the patient returns to the office, query the patient whether her address, phone, or insurance information, and/or e-mail address (if the patient has an e-mail consent form on file) have changed since her last visit, so that the office information is always current. Figure 11-1 is an example of a patient registration form.

Patient Medical History

The medical history form, the second part of the registration process, contains the patient's past medical history (including illnesses, surgeries, known allergies, and current medications), family medical history, and social and occupational

FIGURE 11-1 Typical patient registration form.

history (including diet, exercise, smoking, and use of alcohol or drugs). Usually, the history form also includes a section for the patient to describe the history of the condition or complaint that is the reason for her visit. This section is known as the *history of present illness*, or *HPI*. Medicare and managed care plans now require that the patient's complaint be entered into the medical record. This primary problem is also known as the *chief complaint*, and it should be recorded in the medical records using the patient's own words, if at all possible.

The patient medical history form—similar to the patient registration form—serves as the base document for the patient's medical record. Because of this, it should contain as much information about the patient's medical history as possible. In some offices, the medical assistant reviews the medical history form with the patient to make sure it is complete. If this task is part of your job, be sure to perform this initial interview in a private location (Figure 11-2). Make sure there are no blanks and, if you are assisting the patient with filling

FIGURE 11-2 Perform the initial patient interview in a private location.

© McGraw-Hill Education

out the document, be sure to use his own words as much as possible. For example, when asking the patient about alcohol consumption, you might document “Patient states that . . .,” filling in the blanks using the exact words of the patient. When the interview is completed, be sure to ask the patient, “Is there anything else you would like me to share with the physician for you?” Be sure to document any positive responses. If the patient brought any medical documents with him from previous healthcare providers, including lab, X-ray, or test results, be sure to attach them to the patient’s medical record for the physician’s review.

In most offices, the physician will use the medical history form as the “springboard” for a discussion with the patient as to the reason for her appointment, and to get to know a little bit about each new patient. See Figure 11-3.

Physical Examination Form

Many times, a form is used to record the patient **review of systems**, often abbreviated ROS, and the results of a general physical examination. The review of systems is an “inventory” of the body obtained by the healthcare provider through a series of questions. The purpose of this review is to identify any signs or symptoms the patient is experiencing that reveal information about an illness or condition. As an “oral examination,” the ROS should not be confused with the actual physical exam. The use of a physical examination form ensures consistency in the examination format and minimizes the risk of “forgotten documentation.” In most offices, the physician will perform both the ROS and the physical examination, but as the medical assistant, you may perform and document the patient’s vital signs (temperature, pulse, BP, respiration, and height and weight) on the physical examination form for the physician. Figure 11-4 shows a typical ROS and physical examination form.

Results of Laboratory and Other Tests

Test results include findings from tests performed in the office and those received from other physicians, hospitals,

independent laboratories, or other outside sources. Some offices use a laboratory summary or flow sheet to help the doctor detect significant changes more easily.

Test results received from sources outside the practice are best organized in sections within a specific section of the medical record designed for this purpose. You will learn more about arranging information within the medical chart a bit later in the chapter.

Documents from Other Sources

Incoming records from other sources also must be entered and stored in the patient’s medical record. If a patient has requested documents from another physician or hospital to be sent to your office, a copy of the patient’s written request authorizing the release of these records to your office from its original source also must be included in the medical record.

Diagnosis and Treatment Plan

The patient’s diagnosis must be recorded in the medical record, along with the physician’s proposed treatment plan. The treatment plan may include treatment options, the final treatment plan, instructions to the patient, and any medications prescribed. The licensed practitioner (MD, DO, PA, NP) also may include any specific comments or impressions regarding the patient and his care on record. All of this information is recorded for every patient visit in documents known as progress notes (Figure 11-5).

Operative Reports, Follow-up Visits, and Telephone Calls

Continuation of the record lasts as long as the patient is under the practitioner’s care. All procedures, surgeries, follow-up care, notes, phone calls, and other patient contacts by the office staff should be recorded in the patient’s medical record. Multiple progress notes may be added to the medical record as needed. A discussion on charting methods will follow later in the chapter. Depending on office policy, phone calls and between-visit contacts may be inserted in the record in chronological order, or a log of telephone contacts may be kept separately in the patient record.

Hospital Discharge Summaries

The hospital discharge summary generally includes information that summarizes the reason the patient entered the hospital; tests, procedures, and operations performed in the hospital; medications administered to the patient; and the disposition (outcome) of the case. Elements of the summary may include the following:

- Date of admission
- History of present illness (HPI)
- Date of discharge
- Admitting diagnosis
- Surgeries, procedures, or hospital course (treatment obtained in the hospital)
- Complications (if any)

Consent Forms

As discussed in the *Legal and Ethical Issues* chapter, signed informed consents must be obtained when any procedure is

being performed on a patient. An example of such a form is shown in Figure 11-6. In order for any consent to be considered “informed,” the patient must understand the treatment offered and the possible outcomes or side effects of the treatment. The patient also should be informed of the possible outcome if the patient receives no treatment, as well as be informed of any alternative treatments and possible risks. Once the patient signs the consent form, he may withdraw consent at

any time prior to the treatment being carried out. Signatures on informed consent documents must be witnessed; medical assistants, as members of the office medical team, are allowed to act as witnesses for such documents.

Correspondence with or About the Patient

All written correspondence from the patient or from other providers, laboratories, or independent healthcare agencies must be kept in the patient's medical record. Each piece of

correspondence should be marked or stamped with the date the medical office received the document.

Information Received by Fax

Some information—like laboratory results, practitioner comments, or correspondence—may be received by fax or even secure (encrypted) e-mail transmission if the information is required rapidly. If possible, request that an original of any faxed document be mailed to the office as a final record.

FIGURE 11-5 Typical progress note using SOAP format.

E-mails may be printed out and inserted into the patient medical record. When doing so, be sure they are printed so that the sender information and date/time are included in the printout.

Dating and Initialing You must be careful not only to date everything you put into the patient chart but also to initial each entry. This system makes it easy to identify who in the practice is responsible for each entry. In many practices, the practitioner initials or stamps reports before they are filed to prove that patient's licensed provider saw them prior to filing.

Maintaining Confidentiality

As always, every patient's personal health information, whether coming into the office or being transmitted to or from another location, is covered by the HIPAA privacy

and Security Rule and must be kept confidential. As per HIPAA, patients have the following specific rights regarding their protected health information (PHI) and their medical records:

1. *The right to notice of privacy practices.* Because it is unlikely that your patients will be reading federal laws, the law states that it is your responsibility to give them a copy of the laws that protect them concerning their PHI. Patients must receive a written notice of privacy practices on their first visit to a healthcare provider. They should sign a form stating they have received this information. This signed form must be carefully filed in the patient's medical record.
2. *The right to limit or request restriction on their PHI and its use and disclosure.* This means that patients can limit how your office uses their medical information and how much of that information is shared. For example, a patient with a history of sexually transmitted infection may not wish to have that information released to the orthopedic physician who is setting his broken arm. It is not necessary. In general, only the minimal amount of patient information should be released to meet the current needs of the patient. This is called the "Need to Know" general rule.

**CONSENT TO OPERATION, ADMINISTRATION OF ANESTHETICS,
AND RENDERING OF OTHER MEDICAL SERVICE**

Patient: _____ DOB: _____

1. I authorize and direct _____ with the associates and assistants of his/her choice to perform upon myself the following procedure:

If any unforeseen conditions arise in the course of this procedure or in the post-procedure period, calling on their judgment for other procedures or surgery, I further request and authorize them to do whatever is deemed advisable for my health and well-being.

2. The risks and alternative aspects of autologous blood transfusions (receiving my own blood donated prior to surgery), designated blood transfusions (donated in advance by family/friends for my use), or homologous blood transfusions (from the general donor population) have been explained to me. I understand autologous and designated transfusions can be accommodated only for nonemergency surgeries.

6. I certify that I understand the above consent to surgery and that the explanations referred to have been made to me.

Signature _____ Date: _____

Witness _____ Date: _____

FIGURE 11-6 An informed consent form must be completed and signed by the patient prior to any procedure being performed.

Always read record release requests carefully. Only the information requested and/or the date range required for that information should be released, nothing more.

3. *The right to confidential communications.* This means that patients can request to receive PHI in a manner other than during a medical appointment. For example, your patients may request that you call them at a variety of numbers, including home, work, or cell phone number. The patient does not have to explain the request. The law says you must make a reasonable effort to communicate with the patient in a confidential manner as the patient requests.
4. *The right to inspect and obtain a copy of their PHI.* This means that patients have a right to request and receive a copy of their own medical records. There are a few exceptions to this rule; however, in general, the medical

assistant receives and processes all patient requests for medical records. It is important to always follow the protocols established in your office for medical record copying. It is considered an acceptable practice to act on a request within 30 days of the request and to charge a reasonable fee to cover the expense for copying supplies and labor.

5. *The right to request an amendment to their PHI.* Patients have the right to request an amendment to their PHI. The request may be denied if the healthcare provider receiving the request is not the original recorder of the PHI, or if the PHI is believed to be accurate and complete. Healthcare providers have the right to require that a request to amend a record be made in writing. All requests for amendment and response must be carefully documented and filed in the medical chart.

FIGURE 11-7 A newly assembled paper patient medical record.
© McGraw-Hill Education

6. *The right to know if their PHI has been disclosed and why.* For example, PHI is disclosed when a specialist or other doctor is seen. Practitioners are required to keep a written record of every disclosure made of a patient's PHI. A written record of any request by the patient for this information and the response of the healthcare provider must also be kept. This information is usually filed in the patient's medical record. When making a disclosure of information, always record the date of the disclosure, the name and address of the person receiving the PHI, a brief summary of the information released, and the purpose of the disclosure.

The HIPAA Privacy and Security Rule as it relates to all aspects of patient care, including the care and protection of patient medical records, is covered in detail in the *Legal and Ethical Issues* chapter. Now that you have learned about the forms that may be found in a medical record, Procedure 11-1, found at the end of the chapter, will outline how to assemble a new patient paper medical record. See Figure 11-7.

► Types of Medical Records LO 11.3

The process of documenting information in medical records can be accomplished using several formats. You should be familiar with the approaches to documenting patient information and learn to be comfortable using each approach. The most common methods are the source-oriented and problem-oriented medical records.

Source-Oriented Medical Records

In the **source-oriented medical record (SOMR)** approach, patient information is arranged within the medical record according to who supplied the data. The SOMR (sometimes called the conventional method) includes areas for data from the patient, treating physician, specialist, laboratory, hospital, or other locations to document in the record. If a specific form is used to attach these documents to the medical record, it often contains a space for patient remarks, followed by a

section for the physician's comments. Often, in a SOMR, one side of the record (often the left side) is used for the practitioner's notes, which are listed in reverse chronological order. The other side of the chart contains records from the other listed sources, with like sources grouped together in reverse chronological order.

The practitioner's notes describe all problems and treatments on the same form in simple chronological order. For example, a patient's broken wrist would be recorded on the same form as her stomach ulcer. Although easy to initiate and maintain, this system presents some difficulty in tracking the progress of a specific ailment. For instance, in order for anyone to find information on the patient's stomach ulcer, the approximate time frame of the diagnosis would need to be known so that the chronological record can be searched. Another downfall of this type of record can occur if the patient has a recurrence of a problem. Because of the chronological nature of the record, if the patient develops a second stomach ulcer 2–3 years down the road, the first episode and the second one will be filed in separate locations, causing more searching to locate the related "past medical history."

Problem-Oriented Medical Records

One way to overcome the disadvantages of the source-oriented approach is to use the **problem-oriented medical record (POMR)** system. This approach, developed by Lawrence L. Weed, MD, makes it easier for the physician to keep track of a patient's progress. The information in a POMR includes the following items: database; problem list; educational, diagnostic, and treatment plan; and progress notes. Let's take a look at each of these components in a bit more detail.

Database The database includes a record of the patient's past medical history; information gained in the initial interview with the patient (for example, "Patient unemployed for the second time in past 12 months"); all findings and results from the physical examinations (such as "Pulse 105 bpm, BP 210/80"); and any tests, X-rays, and other procedure results.

Problem List Each condition or diagnosis a patient has is listed separately and given its own number, including the date of onset. Each "problem" is then identified by its number throughout the record. Work-related, social, or family problems that may be affecting the patient's health also may be listed in this problem list. For instance, the problem list for the example patient who is unemployed might include "Severe stomach pain, worse at night and after eating, has begun since the patient became unemployed for the second time."

You can alert the doctor to the fact that the patient has lost two jobs within 1 year. Such radical life changes can often provoke strong physical (and psychological) reactions. In this patient's case, the elevated blood pressure may be related to the job losses, and stress may be causing the stomach pain.

When you document problems, be careful to distinguish between signs and symptoms. **Signs** are **objective**, or external, factors—like blood pressure, rashes, or swelling—that can be seen or felt by the doctor or measured by an instrument. **Symptoms** are **subjective**, or internal, conditions felt by the patient—like pain, headache, or nausea—but are not necessarily apparent in a physical examination. Together, signs and symptoms help clarify a patient’s problem and can help lead to a diagnosis.

Educational, Diagnostic, and Treatment Plan Each problem should have a detailed educational, diagnostic, and treatment summary in the record. The summary contains diagnostic workups, treatment plans, and instructions for the patient. Following are two examples. For the first problem, the summary areas are marked. Can you identify the areas of the second problem?

PROGRESS NOTE

Patient Name:

Patient X

Diagnostic

Educational

Treatment

Problem 1. Elevated BP
P 105, R 25. BP recorded at 210/80 by MA; 180/90 by MD.

Suggested patient should start on *Atenolol*, but he wants to try stress management first (see problem 2).

Recheck BP in one week.

Problem 2. Stomach Pain
Upper GI exam negative, CBC normal. Prescribed over-the-counter antacid, 2 tablets by mouth t.i.d. after each meal. Set up appointment for patient with R. Neil, PhD, at the stress-management clinic (Broughten Professional Center) for Monday, February 4, at 4:30 p.m. Patient’s anxiety is high. Recheck in 1 week.

Progress Notes Progress notes are entered for each problem listed in the initial record. The documentation always includes—in chronological order—the patient’s condition, complaints, problems, treatment, and responses to care. Using the same two problems, here are two examples.

PROGRESS NOTE

Patient Name:

Patient X

Problem 1. Elevated BP
Patient began stress reduction class. Through it, also began looking for employment, seeking assistance through local community college. Feeling more positive. BP down to 130/82. P90 and regular R20. Explained to patient that BP is still borderline, but considering the dramatic reduction, will hold off on medication. Gave patient low-fat/low-salt diet and asked him to return for recheck in 4 weeks.

Problem 2. Stomach Pain
Patient enrolled in stress-reduction class. Reports stomach pain has diminished; “I can eat without pain; only a little discomfort at night.” Reduced antacid to one tablet by mouth two times daily after meals. Anxiety much reduced. Recheck anxiety level in 4 weeks.

SOAP Documentation

Many medical offices using the POMR format also emphasize the **Subjective, Objective, Assessment, and Plan (SOAP)** approach to documentation, which provides an orderly series of steps for dealing with any medical case. Information is documented in the record in the following order.

1. **S:** Subjective data come from the patient; the patient describes his or her signs and symptoms and supplies any other opinions or comments about the current problem.
2. **O:** Objective data come from the physician, examinations, and test results.
3. **A:** Assessment is the diagnosis or impression of a patient’s problem.
4. **P:** Plan of action includes treatment options, chosen treatment, medications, tests, consultations, patient education, and follow-up.

Regardless of whether your office keeps SOMR or POMR charts, the SOAP format for documentation can still be used. It is a popular documentation model because it allows each type of data to be located within each

documented note easily, instead of searching the entire entry. Figures 11-5 and 11-8 show examples of the SOAP note format using a preprinted form. The shaded columns noting where the subjective, objective, assessment, and plan information are to begin makes finding specific information easier for the user.

Note that in Figure 11-8, abbreviations such as RLQ (right lower quadrant), F (Fahrenheit), BP (blood pressure), and T (temperature) are used. If you choose to use abbreviations when charting in a medical record, use only approved medical abbreviations. To reduce confusion in medical records, abbreviations are being used less often, except for those that are very clear in meaning. Currently, The Joint Commission (TJC) does not produce an approved list of abbreviations, but it does state that the following should NOT be used when charting:

- The symbols “>” and “<”
- All abbreviations for medication names
- Apothecary units
- The symbols “@”
- The abbreviation “cc”
- The abbreviation “μg”

Before charting in the office medical record, check the policies and procedures manual to see if your office has specific abbreviations that are not to be used in patient medical records. The purpose of the patient medical record is to document information so that all who have access to the information clearly know what is being

documented. If you are questioning if an abbreviation may be misunderstood, it is better to write out the word for the sake of clarity. See Appendix II *Abbreviations and Symbols Commonly Used in Medical Notations* at the end of the book for a list of the common abbreviations used in medical records.

CHEDDAR Format

The **CHEDDAR** format of medical records documentation takes the SOAP format further, breaking it down into smaller components. CHEDDAR stands for

1. **C:** Chief complaint, presenting problems, subjective statements.
2. **H:** History; past medical, family, and social histories as well as the history of presenting problem (HPI) and any other contributing information.
3. **E:** Examination, including extent of body systems examined.
4. **D:** Details of problem and complaints.
5. **D:** Drugs and dosage—for example, a list of current medications, including dosage and frequency.
6. **A:** Assessment of the diagnostic process and the impression (diagnosis) made by the practitioner.
7. **R:** Return visit information or referral, if applicable.

Figure 11-9 shows you an example of a medical record note using the CHEDDAR format.

► Documentation and the 6 Cs of Charting

LO 11.4

Now that you have an understanding of the basic formats used in documentation, or “charting,” let’s discuss the types of information that will require your new expertise.

Updating Medical Forms

You have already learned that you may be asked to assist new patients with completion of the patient registration and medical history forms. You also will be updating these forms as inevitable changes take place in the lives of your patients—new addresses, changes in marital status, the birth or adoption of a child, and changes in insurance coverage. All of these changes require updates to the patient registration information. In order to make such changes in a paper record, generally you retrieve the chart from the files and cross out the old information, using one line with a note stating the information has changed. You then add the date and your initials. Depending

on the extent of the change, the new information may simply be written by hand as near as possible to the original location or, more likely, a note is made to see the “updated” registration sheet. On the new sheet, the current date will be given, the updated information will be neatly typed into the required spaces, and the new registration sheet will be inserted into the appropriate location of the medical record.

Documenting Test Results

Every time a patient has an X-ray or a lab test, or a letter arrives from a specialist about the patient, it must be inserted into the medical record. Be sure to follow the office policy in placing these items in the same location in each medical record and always in reverse chronological order—which means the most current result will always be on top. If your office uses a lab flow sheet, you also may be required to record the results on a separate test summary sheet in the chart. When doing so, be extremely careful to record the results accurately and in the correct location—the patient’s health and treatment will depend upon it.

PROGRESS NOTES							
Patient Name <u>Sylvia Gonzales</u>		Date of Birth <u>9/1/XX</u>		MRN <u>341-73-792</u>			
Prob. No. or Letter	Date	C	H	E	D	D	A R
1	11/11/XX	Patient states, “I have had a fever and a sore throat for the past two days” Patient was healthy and well until two days ago when she noted the onset of fever and sore throat. Past history includes strep pharyngitis. Vital signs: T 101.1 P 96 R 24 BP 124/76 Weight: 155 Height: 5’ 7” General: patient seems alert. HEENT: sclera clear. Pharynx red with pus pockets noted. Heart: regular w/o murmur Lungs: clear to auscultation and percussion. Abdomen: negative for tenderness. Other than sore throat and fever with noted temperature elevation, patient has no other complaints. Patient takes no daily medication except for a multi-vit. She is given an Rx for Amoxicillin 250 mg 1 tab q8h for 10 days. Strep Pharyngitis. Schedule follow-up appointment for three weeks from today for repeat throat culture.					
Elizabeth H. Williams MD (Attending Physician) Margaret Jones, MA Date: November 11, 20XX							

Form OMB-1243

FIGURE 11-9 Typical chart note using the CHEDDAR format.

Examination Preparation and Vital Signs

As the office medical assistant, you will often prepare each patient for his or her examination. You will record vital signs, any medication(s) the patient is currently taking, and any responses to treatment. Before you leave a patient, always remember to ask, “Is there anything else you would like the doctor to know?” The patient may be more comfortable sharing further information with you than with the doctor. You will document the vital signs, medication information, and any treatment response in the medical record. If the patient does make any additional comments, document these as well and remember to use the patient’s own words if at all possible. Refer to Figure 11-10 for a sample chart note.

Follow-Up

After you record the initial interview, any background information, vital signs, and subjective information (chief complaint), the physician will decide what entries will be made regarding examination, diagnosis, treatment options and plans, including comments or observations about each case. You will then maintain the patient record by performing some or all of the following duties:

- Transcribe notes the doctor dictates about the patient’s progress, follow-up visits, procedures, current status, and other necessary information. Transcription does not occur in all practices using paper records because a transcription service is often responsible for this task.
- Post laboratory or examination results in the medical record or on the summary sheet
- Record telephone calls from the patient and calls that the doctor or other office staff members make to the patient

- Telephone calls can be an important part of good follow-up care. Calls must be dated and the content of the conversations must be documented (Figure 11-11).
- You must initial the entry. Even if the doctor did not reach the patient, the call should be recorded and dated. State whether the doctor got an answer, left a message on an answering machine or with a person, and so on. Legally, if an item is not in the record, it did not happen.
- Record any medical instructions or discharge instructions the doctor gives to the patient
- At the physician’s request, counsel or educate the patient regarding the treatment regimen or home care procedures the patient must follow. This information must be entered into the record, dated, and initialed. For patient convenience, many offices have preprinted instruction sheets for patients to refer to once they arrive home.

The Six Cs of Charting

To maintain accurate patient records, always keep these six Cs in mind when filling out and maintaining charts: Client’s (patient’s) words, Clarity, Completeness, Conciseness, Chronological order, and Confidentiality.

1. *Client’s words.* Be careful to record the patient’s exact words rather than your interpretation of them. For instance, if a client says, “My right knee feels like it’s thick or full of fluid,” write that down. Do not rephrase the sentence to say, “Client says he’s got fluid on the knee.” Often the patient’s exact words, no matter how odd they may sound, provide important clues for the physician in making a diagnosis.

		Bilateral serous otitis media.						
		Amoxil oral suspension™ 150 mg PO q8h. Mom to call in one week to report on progress.						
								
9/8/XX Telephone Call. Lexus Beals called in as requested to report on Bentley's BOM. States he is much improved and no longer complaining of ear pain. Temperature is also back to normal. Told her to call office if symptoms return, otherwise we will see Bentley for his scheduled CPE in January. MAP, CMA (AAMA)								

FIGURE 11-11 Completed chart note including telephone call from patient in follow-up.

2. **Clarity.** Use precise descriptions and accepted medical terminology when describing a patient's condition. For instance, "Patient got out of bed and walked 20 feet without shortness of breath" is much clearer than "Patient got out of bed and felt fine."
3. **Completeness.** Fill out completely all the forms used in the patient record. Provide complete information that is readily understandable to others whenever you make any notation in the patient chart.
4. **Conciseness.** While striving for clarity, also be concise, or brief and to the point. Abbreviations and specific medical terminology can often save time and space when recording information. For instance, you can write "Patient got OOB and walked 20 ft w/o SOB." OOB and SOB are standard abbreviations for "out of bed" and "shortness of breath," respectively. Every office staff member should use the same abbreviations to avoid misunderstandings. Refer to Appendix II, *Abbreviations and Symbols Commonly Used in Medical Notations*.
5. **Chronological order.** All entries in patient records must be dated to show the order in which they are made. This factor is critical, not only for documenting patient care but also in case there is a legal question about the type and date of medical services.
6. **Confidentiality.** Always remember that the information in patient records and forms is confidential and is considered to be PHI. Only the patient, attending physicians (or other caregivers like physician assistants and nurse practitioners), and the medical assistant (who needs the record to tend to the patient and/or to make entries into the record) are allowed to see the medical record without the patient's written consent. Never discuss the information in a patient record, forward it to another office, fax the information, or share it with anyone except the people in the office directly involved in caring for the patient, unless you have the patient's written permission to do so. Refer to the *Legal and Ethical Issues* chapter for detailed information about PHI and patient confidentiality, including HIPAA laws and regulations.

► Appearance, Timeliness, and Accuracy of Records

LO 11.5

Complete medical records will do no one any good if they cannot be understood. They also must be written neatly and legibly; contain up-to-date information; and present an accurate, professional record of a patient's case.

Neatness and Legibility

A medical record is useless if it is difficult (or impossible) to read. Make sure that every word and number in the record is clear and legible. For this reason, if an office uses paper medical records, the records are usually transcribed. Let's look at the transcription process.

Medical Transcription Your knowledge of abbreviations, medical terminology, and medical coding will be invaluable if you are asked to transcribe a physician's notes or dictation. **Transcription** means transforming spoken notes into accurate written form. These written notes are then entered into the patient medical record. As with all parts of the medical record, they are part of the patient's continuing (and confidential) case history and often include findings, treatment stages, prognoses, and final outcomes. Always date and initial all transcription pages. With the advent of voice recognition software, transcription can be done pretty much automatically by the computer, which will type based on the words spoken by the physician. These notes still need to be proofread carefully, until the software recognizes the physician's voice and accent and its dictionary contains the words—particularly medical terms—used most often by the physician.

Regardless of how the transcription occurs, transcribed material will contain the six Cs and, as such, should be accurate and complete, using appropriate grammar, correct spelling, and accurate medical abbreviations and terminology. As always, when dealing with abbreviations, if there is any doubt as to the meaning or use of an abbreviation, use the standard rule of thumb in healthcare: "When in doubt, spell it out." Use the medical dictionary and the medical computer spell-check function to verify the spelling or meaning of words. Ask the physician only if you cannot find something in a reference source. In order to be efficient, above-average typing or word processing speed and accuracy are also important.

Keep a library of medical, secretarial, and transcription reference books and medical terminology texts near the transcription workstation. Abbreviations can save time, but you should use only those that are accepted as standard. Reference books will help you find the correct word quickly and easily and help you apply proper grammar, style, and usage to the copy.

Handwritten Notes If handwritten entries are used in the medical record, follow these tips to keep charts neat and easy to read.

- Use a good-quality pen that will not smudge or smear.
- HIPAA requires that all original documents be maintained in the patient's medical record. Blue ink is considered the best choice for charting for several reasons. Blue ink used in the original record will copy as black, distinguishing the blue original from the black copy and reducing the possibility of error. Blue ink is also more difficult to match, making any additions to the medical record easy to spot, which can cut down on fraudulent entries.
- Use highlighting pens to call attention to specific items like allergies. Be aware, however, that unless the office has a color copier, most colored ink will photocopy black or gray.

Because highlighting-pen marks may not be visible on a photocopy, many offices use brightly colored stickers to list allergies within and on the medical record.

- Make sure all handwriting is legible. Take time to write names, numbers, and abbreviations clearly.
- Make any corrections to the chart by following Procedure 11-2, Correcting Paper Medical Records.

Timeliness

Medical records should be kept up-to-date and be readily available when any healthcare professional needs to see them. Follow these guidelines to ensure that information on a patient can be readily located in the medical record when it is needed.

- Record all exam and test results as soon as they are available.
- If you forget to enter a result into the record when it is received, record both the original date of receipt and the date the report was entered into the record.
- To document telephone calls, record the date and time of the call, who initiated it, the information discussed, and any conclusions or results. Depending on office policy, the call may be recorded directly into the record or a note may be made referring the reader to a separate telephone log, kept elsewhere within the medical record.
- Establish a procedure for retrieving a file quickly in case of emergency. Should the patient be in a serious accident, for example, the emergency doctor will need the patient's pertinent medical history immediately.

Accuracy

The physician must be able to trust the accuracy of the information in the medical records. Make an accuracy check of all data entered within the medical record a priority. To ensure accurate data, follow these guidelines.

- Never guess at or assume knowledge of names, procedures, medications, findings, or any other information about which there is some question. Always check all the information carefully. Make the extra effort to ask questions of the physician or senior staff member to verify information if there is any doubt as to its accuracy.
- Double-check the accuracy of findings and instructions recorded in the chart. Have all numbers been copied accurately? Are instructions for taking medication clear and complete?
- Make sure the latest information has been entered into the chart (and in the appropriate location) so that the physician has an accurate picture of the patient's current condition.

Professional Attitude and Tone

Part of creating timely and accurate records is maintaining a professional tone in your writing when recording information. As stated earlier, whenever possible, record information from the patient using his own words, particularly when recording the chief complaint (the reason for the visit). Also record the practitioner's observations and comments and any laboratory or test results. Never record your personal, subjective

comments, judgments, opinions, or speculations about a patient's words, problems, or test results. You may call attention to a particular problem or observation, for example, by attaching a note to the chart, but do not make such comments a permanent part of the patient's medical record.

► **Correcting and Updating Medical Records**

LO 11.6

In legal terms, medical records are regarded as having been created in “due course.” All information in the medical record should be entered at the time of a patient’s visit and not days, weeks, or months later. Information corrected or added some time after a patient’s visit can be regarded as “convenient” and may damage the physician’s position in a lawsuit. Untimely medical record submissions also can jeopardize a patient’s care. For instance, if a medication is given to a patient but not charted appropriately in a timely fashion, the patient could inadvertently be given another dosage of the same medication, potentially causing an overdose.

Using Care with Corrections

If changes to the medical record are not done correctly, the record can become a legal problem for the physician and

the practice. A physician may be able to more easily explain poor or incomplete documentation than to explain a chart where the original documentation appears to have been altered. Always be extremely careful to follow the appropriate procedures for correcting patient records.

Mistakes in medical records are not uncommon. The best defense is to correct the mistake immediately or as soon as possible after the original entry was made. To correct any mistake in a medical record, carefully draw a single line through the error, making sure that the original entry is still legible. Write or type the corrected information above or below the original entry or even in the margin, as close as possible to the original entry. If there is not enough room near the error to make the full correction, make a notation near the error as to where in the chart the correction may be found. When making the correction, note the date and reason for the correction and initial the completed correction. If at all possible, have another staff member witness the correction and initial it as witness. See Figure 11-12.

9/9/XX Correction to documentation of 9/8/XX. Patient's scheduled CPE is in June, not January as previously recorded. MAP, CMA (AAMA)					

FIGURE 11-12 Example of a corrected medical record.

Updating Patient Records

All additions to a patient's record—test results, observations, diagnoses, procedures—should be done so there can be no interpretation of deception on the physician's part. In a note accompanying the material, the physician should explain why the information is being added to the record. The material may simply be the physician's recollections or observations regarding a patient visit that occurred in the past. Each item added to the record must be dated and initialed. As the office medical assistant, you may be asked to act as a third-party witness of these additions to paper records.

Most hospitals, clinics, and larger medical practices have detailed guidelines for late entries and corrections to patient charts. You must follow these guidelines carefully to avoid potential legal problems. See Procedure 11-3 at the end of this chapter for a list of steps for adding information to a paper patient record. Throughout the textbook, you will find procedures requiring you to document (chart) the procedure you just learned. This will allow you to continue to practice the charting techniques you have learned in this chapter—feel free to refer back here at any time to refresh your memory on proper techniques.

► Responding to Release of Records Request

LO 11.7

As you learned in the *Legal and Ethical Issues* chapter, all physical medical records, including X-rays, test results, and medical notes created by the physician, are considered the property of the practice. Although the information belongs to the patient, the law may require the physician to release the record, as in the case of a patient with a contagious disease or when a court subpoenas the records. Under no circumstances should you release patient information to insurance companies over the telephone. This information should be released in writing only after the patient has signed a written release statement. Under HIPAA, release of information over the telephone will likely be problematic.

Additionally, any request to release medical records should be approved by the physician. As stated earlier in the discussion on PHI, only the information requested should be released. Be sure to check for date ranges listed on the release as well as for specifics as to the exact information being requested. Be sure to release only the specific information requested, within any time frame restrictions outlined.

Procedures for Releasing Records

Physicians often receive requests from lawyers, other physicians, insurance companies, government agencies, and the patients themselves for copies of all or part of their medical records. Follow these steps for releasing medical information.

1. Obtain a signed and newly dated release from the patient authorizing the *transfer* of specific information—from his or her medical record to another party outside the

physician's office. Please note that *verbal consent in person or over the telephone is not considered a valid authorization*. The signed and dated authorization should be filed in the patient's medical record. Refer to Figure 5-7 in the *Legal and Ethical Issues* chapter for an example of an authorization to release (transfer) health information form.

2. Make photocopies of the requested original material. Copy and send only those portions of the record covered by the release and usually only records originating from your facility. Unless the patient specifically requests that you do so, you should not release records that were obtained from other sources, such as consultations or tests done in a hospital. Do not send original documents. (If a record will be used in a court case, however, you must submit the original unless the judge specifies that a photocopy is acceptable.) In the past, originals of X-rays were often required because copies could not be made, but often today CDs can be made of X-rays and even MRIs and CT scans that will often be acceptable to the person requesting the records. If you must send the originals, the recipient should be asked to sign a statement of responsibility for the original records until they are returned to the office. Document in the patient's medical record who has possession of the original documents, the date the recipient received the originals, and the date they are returned. Do request that the recipient return the original documents as soon as possible. Remember to follow up with the recipient until the originals have been returned and placed in the patient's file.
3. Call the recipient to confirm that all materials were received. Avoid faxing confidential records. Unless the recipient has a locked and password-protected fax mailbox, there is no way to tell who will have access to documents sent by fax.

Special Cases It may not always be immediately clear who has the right to sign the authorization to release medical records form. When a couple divorces, for example, both parents are still considered legal guardians of their children, and either one can sign a release form authorizing transfer of medical records. If a patient dies, the patient's next of kin or legally authorized representative, such as the executor of the estate, may see the records or authorize their release to a third party. When you are in doubt regarding who is authorized to sign, *always* ask your supervisor before releasing confidential, protected health information.

Confidentiality

When children reach age 18, most states consider them adults with the right to privacy. No one, not even their parents, may see their medical records without the child's written consent. States extend this right to privacy to emancipated minors who are under the age of 18 and living on their own or are married, a parent, or in the armed services. Confidentiality is often extended to minors seeking care for STIs, birth control, and drug or alcohol counseling. In these instances, the minor

is considered a “mature minor” and her treatment cannot be discussed with her parents without her permission, even though the parents may still be held responsible for payment of such treatment through insurance or self-payment unless the patient pays for treatment at the time of service. Refer to the information regarding minors and their access to medical care in the *Legal and Ethical Issues* chapter for more detailed information.

The main legal and ethical principle to keep in mind is that you must protect each patient’s right to privacy at all times.

Auditing Medical Records

The auditing of medical records is a great housekeeping tool. To **audit** a record means to examine and review a group of

patient records for completeness and accuracy—particularly as related to their ability to back up the charges sent to health insurance carriers for reimbursement. There are two types of audits: internal and external. The medical assistant, and generally the medical office manager and others who handle medical records for a medical office, should periodically perform audits to verify that the medical documentation meets required minimum standards. Many medical offices are now hiring compliance specialists to do internal auditing of their charts.

Internal Audits The medical staff can perform internal audits. Records are chosen randomly. Audits should be done both before billing is submitted (*prospective*) and after billing

BWW

Internal Medical Record Audit Form

Patient name: _____ Date of service: _____

Provider Name: _____ Supervising Physician (if needed): _____

ICD codes: _____

CPT codes: _____

Review the medical record for the following elements:

Yes

No

1. Was the medical record for this service found?☐

2. If a paper record is used, is it legible?☐

3. If provider is not a physician, is the note written or co-signed by the supervising physician?☐

4. Does the date of service billed agree with the date of the medical record?☐

5. Does the documentation support the ICD codes billed?☐

6. Does the documentation support CPT codes billed?☐

7. Does the documentation support the level of service billed? (See below for evaluation criteria).☐

Level of service audit

History (To assign a given level, all three elements must be met or exceeded.)

History of present illness (HPI)	Review of systems (ROS)	Past, family and/or social history (PFSH)	Type of history
Brief	N/A	N/A	Problem-focused
Brief	Problem pertinent	N/A	Expanded PF
Extended	Extended	Pertinent	Detailed
Extended	Complete	Complete	Comprehensive

Physical exam (See CPT Guidelines for body area and organ system definitions)

Problem focused	Expanded PF	Detailed	Comprehensive
Limited to affected area or body system	Exam of affected area or body system & exam of related areas	Extended exam of affected area or body system & exam of related areas	General multi-system exam or complete exam of one organ system

Medical decision making (To assign given level, two of the three elements must be met or exceeded.)

Number of diagnoses or management options	Amount and/or complexity of data to be reviewed	Risk of complications and/or morbidity or mortality	Type of decision making
Minimal	Minimal or none	Minimal	Straight forward
Limited	Limited	Low	Low complexity
Multiple	Moderate	Moderate	Moderate complexity
Extensive	Extensive	High	High complexity

Time-based codes

If more than 50 percent of the face-to-face time with the patient was spent in counseling or coordination of care, indicate the total time.

Counseling/coordination of care time: _____ minutes. Total face-to-face time: _____ minutes

CPT code: _____

FIGURE 11-13 Medical record audit tool.

238 CHAPTER 11

is submitted (*retrospective*). The audit schedule of how often audits should be performed should be determined by the medical office, based on the findings of the audits themselves. Many offices perform biannual audits, while others prefer quarterly audits. If an office finds that many charts are “failing” the internal audits, medical staff training should take place and internal audits performed more frequently until the medical records meet the required standards. A sample chart review form created by Ronald Bradshaw, MD, CPA, can be found at <http://www.aafp.org/fpm/2000/0400/fpm20000400p28-rt1.pdf>. See Figure 11-13 for a copy of this medical record audit tool.

External Audits Government entities (such as Medicare and Medicaid), managed care organizations (MCOs), and private insurance carriers perform external audits. The number of government (and private) audits has increased greatly

in the past decade, as federal programs and private payers seek to recover possible overpayments. External auditors may want to investigate the medical records further by interviewing the staff members, patients, and all physicians who participated in the patient’s care. If the medical record does not back up the charges sent to the payer, the provider (practitioner and office) may be found guilty of fraudulent billing practices. At the very least, the charges considered as fraudulently obtained will need to be returned to the payer and/or to the patient. If federal programs like Medicare and Medicaid are involved, more severe penalties may be incurred, including large financial penalties, loss of the ability to participate in federal programs, jail, and loss of the physician’s medical license. More about medical billing and fraudulent practices will be discussed in the chapters on insurance, coding, and billing.

PROCEDURE 11-1 Preparing a New Patient Paper Medical Record

WORK // DOC

Procedure Goal: To assemble a new patient paper medical record

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: File folder, labels as appropriate (alphabet, numbers, dates, insurance, allergies, etc.), forms (patient registration, medical history, advance directives, physician progress notes, laboratory forms), and a hole punch

Method:

1. Carefully create a chart label according to practice policy. This label may include the patient’s last name followed by the first name, or it may be a medical record number for those offices that utilize numeric or alphanumeric filing.
RATIONALE: *The label must be correct to avoid filing errors.*
2. Place the chart label on the right edge of the folder, extending the label the length of the tab on the folder.

3. Place the date label on the top edge of the folder, updating the date according to practice policy. (The date is usually updated annually, if the patient has come into the office within the last year.)

RATIONALE: *This makes it easy to identify current patient records for retrieval and identify records for purging if the patient has not been seen for a specified amount of time (often, 3 years).*

4. If alpha or numeric filing labels are utilized, place a patient name label on the chart according to practice policy.
5. Punch holes in the appropriate forms for placement within the patient’s medical record.
6. Place all the forms in appropriate sections of the patient’s medical record.

RATIONALE: *Consistency in document placement assures that items can be found quickly when required.*

PROCEDURE 11-2 Correcting Paper Medical Records

Procedure Goal: To follow standard procedures for correcting a paper medical record

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Patient file, other pertinent documents that contain the information to be used in making corrections (for example,

transcribed notes, telephone notes, physician’s comments, correspondence), and a good ballpoint pen

Method:

1. Corrections and additions should be made so the original information remains readable, so there can be no suggestion of intent to conceal information. Draw a single line through the information to be replaced.

FIGURE Procedure 11-2 Step 1 Corrections should be made using a single line through the error so it can still be read.

© McGraw-Hill Education

RATIONALE: The single line ensures that the original entry can still be seen, avoiding future potential charges of a “cover-up.”

2. Write or type in the correct information above or below the original line or in the margin. The location in the chart for the new information should be clear. If a separate sheet of paper or another document is required for the

correction or addition, clearly note in the record “See attached document A” or use similar wording to indicate where the corrected information can be found.

RATIONALE: It is important that information within the chart may be readily found at all times to allow for excellent patient care.

3. Place a note near the correction or addition stating why it was made (for example, “error, wrong date; error, interrupted by phone call”). Make sure you initial and date the correction. This indication can be a brief note in the margin or an attachment to the record. Do not make any changes or additions in a record without noting the reason for them.

RATIONALE: By noting the reason as well as the correction, you clearly indicate that the correction is intentional and necessary.

4. Enter the date and time, and initial the correction or addition.
RATIONALE: No correction to a medical chart is complete or acceptable without these elements.
5. If possible, have another staff member or the physician witness and initial the correction to the record when you make it.

PROCEDURE 11-3 Entering (Adding) Information into a Paper Medical Record

Procedure Goal: To document continuity of care by creating a complete, accurate, timely record of the medical care provided to a patient in your medical facility

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Patient medical record, pertinent documents (test results, X-ray results, telephone notes, correspondence, etc.), blue ballpoint pen, notebook, keyboard, and transcription equipment

Method:

1. Verify that you have the correct chart for the documents to be filed. Carefully check the patient’s name, DOB, and medical record number (if available) as verification.

RATIONALE: The patient’s medical record is a legal document. You must be certain that documentation takes place in the correct medical record.

2. Transcribe any dictated notes as soon as possible and enter them into the patient record. If notes are handwritten, be sure they are filed in the correct location within the medical record.

RATIONALE: Records must be kept up-to-date to maintain patient continuity of care.

3. Spell out the names of disorders, diseases, medications, and other terms the first time you enter them into the patient record, followed by the appropriate abbreviation—for example, “congestive heart failure (CHF).” Thereafter, you may use the abbreviation alone.

RATIONALE: Follow the six Cs of documentation, one of which is clarity. There can be no confusion due to the use of abbreviations.

4. Enter only what the doctor has dictated. Do *not* add your own comments, observations, or evaluations. Use self-adhesive flags or other means to call the doctor’s attention to something you have noticed that may be helpful to the patient’s case. Date and initial each entry.

RATIONALE: As a legal document, there is no place for personal comments or observations as part of the permanent patient medical record.

5. Follow office procedure to record routine or special laboratory, X-ray, or other test results. These results may be posted in a particular section of the file or on a separate test summary form. If you use the summary form, make a note in the file that the results were received and recorded. Place the original report in the patient’s file if required to do so by office policy. Date and initial each entry. File all correspondence and hospital records in the appropriate area of each chart, using reverse chronological order so that the most recent record is on top. Be sure that each document is initialed or stamped by the physician as having been seen, prior to filing it in the patient’s chart.

RATIONALE: In order for the record to be useful for any medical professional using it, all documents must be filed using a consistent, easily understandable method such as POMR.

6. Make a note in the record of all telephone calls to and from the patient. Date and initial the entries. These entries also may include the doctor's comments, observations, changes in the patient's medication, new instructions to the patient, and so on. If calls are recorded in a separate telephone log, note in the patient's record the time and date of the call and refer to the log. It is particularly important to record such calls when the patient resists or refuses treatment, skips appointments, or has not made follow-up appointments.

RATIONALE: *As a legal representation of the patient's medical care, it is equally important to log the patient's response and responsibility toward his own medical care, plan, and treatment.*

7. Make notations in the medical record of any immunizations and vaccines that have been given to the patient. Notations should be posted in the patient's immunization record inside the medical chart. Input them into your

state's public health database as well. Immunization records are kept indefinitely as a permanent part of the patient's medical history.

8. Read over the entries for omissions or mistakes. Ask the doctor to answer any questions you have.

RATIONALE: *It is imperative that all parts of the medical record contain the six Cs of medical charting and are free of errors and omissions.*

9. Make sure that you have dated and initialed each entry.
10. Be sure that all documents are included in the file and within the appropriate location so they can be found easily when needed.

11. Return the patient's medical record to its appropriate location in the filing system as soon as possible.

RATIONALE: *If the medical record is perfectly maintained but cannot be found, it does neither the physician nor the patient any good.*

S U M M A R Y O F L E A R N I N G O U T C O M E S	
LEARNING OUTCOMES	KEY POINTS
11.1 Explain the importance of patient medical records.	Medical records are legal documents that give a complete, concise, chronological history of a patient's past medical history, current medical issues, treatment plan, and treatment outcome. Additionally, they act as a communication tool between care providers. The patient medical record provides physicians and other healthcare providers with all the important information, observations, and opinions that have been recorded about a patient.
11.2 Identify the documents that constitute a patient medical record.	The records that constitute the patient medical record include, but are not limited to, the following: patient registration form, medical history form, physical exam form, laboratory and other test results, records from physicians or hospitals, physician diagnosis and treatment plan, operative reports, hospital discharge summaries, follow-up notes, records of telephone calls, signed informed consents, and correspondence with or about the patient.
11.3 Compare SOMR, POMR, SOAP, and CHEDDAR medical record formats.	SOMR files documents in the medical record in strict chronological order. POMR files the same documents according to numbered problems found on the patient problem list. SOAP notes organize medical record documentation according to subjective, objective, assessment, and plan. The CHEDDAR format breaks down this information even further into chief complaint, history, exam, details, drugs, assessment, and return visit plan.
11.4 Recall the 6 Cs of charting, giving an example of each.	The six Cs of charting are client's words, clarity, completeness, conciseness, chronological order, and confidentiality.
11.5 Describe the need for neatness, timeliness, accuracy, and professional tone in patient records.	Neatness, legibility, accuracy, and professional tone are musts in maintaining medical records. Remember that patient medical records are legal documents. They must be kept up-to-date and should be easy to read. Make sure you project a professional tone when recording information. Always check for accuracy and never guess at information. Personal thoughts and observations should never be a permanent part of the patient medical record.

LEARNING OUTCOMES	KEY POINTS
11.6 Illustrate the correct procedure for correcting and updating a medical record.	The proper way to make corrections in a medical record is to draw a single line through the error so that the original entry is still legible. Make the correction as close as possible to the original entry, noting the reason for the correction, and initial the correction. Any additions to a medical record also should be made as soon as the need for the addition is noted, and the reason for the addition or change should be clearly documented.
11.7 Describe the steps in responding to a written request for release of medical records.	In order to release any confidential medical information, express written permission from the patient must be received. Unless it is impossible to do so, copies should be made and the originals should remain in the office. If originals must be released, a statement of responsibility should be signed by the receiver and should be noted in the patient's chart. Follow-up should take place until the original records are returned to the office and to the patient's record. Only release records that are expressly requested and authorized by the patient.

CASE STUDY CRITICAL THINKING

© David Sacks/Getty Images

Recall Mohammad from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding his case.

1. As a new patient, which documents should be completed prior to Mohammad being seen by the

physician? What documents should he have brought with him, if available?

2. Your office uses a SOAP format for medical records. After Dr. Williams completes her exam, explain where each of the new documents or pieces of information obtained during Mohammad's exam will be filed using the SOAP format.

EXAM PREPARATION QUESTIONS

1. (LO 11.1) The process of recording information in a patient's medical record is called
 - a. Auditing
 - b. SOAP
 - c. CHEDDAR
 - d. Documentation
 - e. Demographics
2. (LO 11.1) Which of the following are possible uses for patient medical records?
 - a. Research
 - b. Quality of care (quality control)
 - c. Patient education
 - d. Quality of care (quality control) and patient education only
 - e. Research, quality of care (quality control), and patient education
3. (LO 11.2) Which document serves as the "base" for the patient medical record?
 - a. The registration form
 - b. The patient medical history form
 - c. The physical examination form
 - d. The patient demographic form
 - e. The patient review of systems
4. (LO 11.2) Which of the following documents from other sources frequently become part of a patient's medical record?
 - a. X-rays, CT scan, and MRI results
 - b. Lab results from private labs or hospitals
 - c. Hospital discharge summaries
 - d. Hospital operative notes
 - e. All of these

5. (LO 11.3) Which filing system uses the patient problem list as the source for filing within the patient medical record?
 - a. POMR
 - b. SOMR
 - c. SOAP
 - d. CHEDDAR
 - e. All of these
6. (LO 11.3) Which of the following patient details would be filed under “O” using the SOAP documentation method?
 - a. “I have the flu”
 - b. Nausea
 - c. BP 160/92
 - d. Influenza
 - e. Rest, fluids, ibuprofen; f/u in 5 days by phone
7. (LO 11.4) Which of the six Cs means “getting to the point”?
 - a. Clarity
 - b. Completeness
 - c. Chronological
 - d. Confidentiality
 - e. Conciseness
8. (LO 11.5) In order to “trust” the information in the medical record, documentation must be _____ at all times.
 - a. Timely
 - b. Chronological
 - c. Transcribed
 - d. Accurate
 - e. Professional in tone
9. (LO 11.6) Which of the following is necessary when correcting or making additions to a paper medical record?
 - a. Draw a single line through the error
 - b. Make the correction as close as possible to the original entry
 - c. Note the reason for the correction
 - d. Sign and date the correction
 - e. All of these and, if possible, a witness should initial entry
10. (LO 11.7) Why are internal chart audits advisable for every medical office?
 - a. To verify that the medical record “backs up” the charges being billed
 - b. To give staff members practice reading physician handwriting
 - c. To assure that all members of the staff are current with all patient medical issues
 - d. To be sure that all possible charges are being submitted to the insurance carrier
 - e. None of these

SOFT SKILLS SUCCESS

Recall Mohammad from the case study at the beginning of the chapter.

1. Mohammad's mother brought the completed new patient forms to the office for this appointment. During Mohammad's pre-exam interview, it becomes obvious that there are some inconsistencies between what his Mother entered in the social and sexual history areas and what he is now telling you. How should this be handled?
2. Mohammad's mother asked to be invited to the post-exam discussion with Dr. Williams and Mohammad. He is

OK with this as long as his “private” information is not shared with his mother. As a minor of 16, can he make this decision? (Refer to the chapter *Legal and Ethical Issues* as needed.)

Electronic Health Records

CASE STUDY

PATIENT INFORMATION	Patient Name	DOB	Allergies
	Ken Washington	12/1/19XX	Sulfa
PATIENT INFORMATION	Attending	MRN	Other information
	Paul F. Buckwalter, MD	891-12-743	Takes OTC Excedrin® for headaches

Ken Washington is a 61-year-old who arrives for his routine follow-up visit. Although he has not been diagnosed with hypertension, Ken has a strong family history of hypertension. He is concerned about this history and mentions today that he has had occasional weakness in his left arm and he feels that he has had an increase in headaches

© McGraw-Hill Education

recently, which are readily addressed by OTC Excedrin®. While you are checking him in, you notice him looking at the computer monitor on your desk. The monitor is displaying the screen saver for the new EHR program recently installed at the office. He asks, “What is EHR?”

Keep Mr. Washington in mind as you study the chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

ACTIVSim

LEARNING OUTCOMES

After completing Chapter 12, you will be able to:

- 12.1** List four medical mistakes that will be greatly decreased through the use of EHR.
- 12.2** Differentiate among electronic medical records, electronic health records, and personal health records.
- 12.3** Explain the concept of meaningful use, identifying at least two of its goals.
- 12.4** Contrast the advantages and disadvantages of electronic health records.
- 12.5** Illustrate the steps in creating a new patient record and correcting an existing record using EHR software.
- 12.6** Describe some of the capabilities of EHR software programs.
- 12.7** Explain how you might alleviate a patient's security fears surrounding the use of EHR.

KEY TERMS

- customized
- electronic health record (EHR)
- electronic medical record (EMR)
- face page
- face sheet
- HITECH
- meaningful use
- personal health record (PHR)
- Practice Management System

- VI.C.8** Differentiate between electronic medical records (EMR) and a practice management system
- VI.C.12** Explain meaningful use as it applies to EMR
- VI.P.3** Create a patient's medical record
- VI.P.4** Organize a patient's medical record
- VI.P.6** Utilize an EMR
- VI.P.7** Input patient data utilizing a Practice Management System
- X.C.10** Identify:
 - (a) Health Information Technology for Economic and Clinical Health (HITECH) Act
- X.C.3** Describe components of the Health Information Portability and Accountability Act (HIPAA)
- X.P.3** Document patient care accurately in the medical record

7. Records Management

- a. Perform basic keyboarding skills (i.e. Microsoft Word, etc.)
- b. Utilize Electronic Medical Records (EMR) and Practice Management Systems
- c. Comply with federal, state, and local laws relating to exchange of information and describe elements of meaningful use and reports generated

8. Administrative Procedures

- a. Gather and process documents
- f. Display professionalism through written and verbal communications

11. Career Development

- b. Demonstrate professional behavior

► Introduction

Has your primary care physician (PCP) ever referred you to a specialist and, in the specialist's office, you spent the first 15 minutes filling out a medical history form so the medical staff had "the same medical history" that they have on file at your PCP's office? Have you ever been asked about any medication allergies or your surgical history and you just could not remember the name of the new drug you developed an allergy to or the year you had your appendix removed? Now, imagine that before you even arrive at the office, the medical staff already has that information at their fingertips, thanks to their new electronic health record (EHR) system. All you need to do is review the information with the specialist to verify that everything is correct to the best of your knowledge. Welcome to the world of electronic health records (EHR).

► A Brief History of Electronic Medical Records

LO 12.1

In the early 1990s, it became apparent that paper medical records could no longer meet patients' or healthcare providers' needs. The increasing need for coordination of care (consider how many physicians you see), rising healthcare costs (15% of the US gross national product), and the rather alarming increase in medical errors fueled this realization. Medical errors are the eighth leading cause of patient death in the United States. Most of these errors can be traced to communication problems, including

- Lost or misfiled paper records.
- Mishandled or "forgotten" patient messages.

- Inaccurate or unreadable information in a paper medical record.
- Misfiled or unreadable laboratory or prescription orders.

Because of this, President George W. Bush signed an executive order in August 2006 to promote the overall efficiency and quality of healthcare in America. At the base of this order was promotion of the electronic health record, with a goal of most Americans having access to electronic health records by 2014. In many areas of the country, particularly in urban areas, this goal has been met and electronic medical records are now the rule rather than the exception. The overall goal of this order was to decrease medical errors through record legibility and record uniformity, and to increase information available among patients, medical providers, and the insurance carriers who pay for that care. Meeting this overall goal would help to control the rising cost of healthcare to both the patient and the insurance carriers, including government-funded programs like Medicare and Medicaid. Although implementation can be expensive, the electronic record (see Figure 12-1) is quickly becoming the licensed practitioner's most important business and legal record.

► Electronic Records

LO 12.2

The terms *electronic medical record* and *electronic health record* are seemingly used interchangeably, but they are defined differently by the National Alliance for Health Information Technology (NAHIT). The **electronic medical record (EMR)** is an electronic record of health-related information for an individual patient that is created, compiled, and managed by providers and staff members located within a *single* healthcare organization. If that same

FIGURE 12-1 A face page from the Practice Fusion® Practice Management System provides an overview of Nancy Evans.
© Practice Fusion®

information on an individual patient is created, managed, and gathered in a manner that conforms to nationally recognized *interoperability standards*, so that it can be utilized by members of more than one healthcare organization, it is known as an **electronic health record (EHR)**. These EHR are the federal government’s ultimate goal. Because any provider with an interoperable EHR system will have access to a patient’s information—no matter where the information originated—there will be increased patient continuity of care, reduction in medical errors, and, ultimately, decreased healthcare costs.

One of the offshoots of EHR that is less understood by both physicians and patients is the **personal health record (PHR)**. A personal health record is basically an electronic version of the comprehensive medical history and record of a patient’s lifelong health that is collected and maintained by the individual patient. This record may then be shared with providers at the patient’s discretion. See Table 12-1, which outlines the basic differences between PHR and EHR.

In this era of employers, government, and insurance plans asking patients to take a much more active role in their health-care, the PHR is a natural response to this need. PHR may be stored and maintained on secure Internet sites where the

information may be efficiently managed by the patient and shared with providers as the patient wishes. Keep in mind that no matter what form a patient record takes, protected health information (PHI) is involved. As covered by HIPAA laws, PHI cannot be disclosed without patient express written permission unless allowed by federal or state statute. Refer to the *Medical Records and Documentation* chapter for more detailed information regarding HIPAA and PHI.

Because of governmental concerns surrounding data breaches possible with EHR, the American Recovery and Reinvestment Act (ARRA) became law in 2009. Part of this law includes the Health Information Technology for Economics and Clinical Health or HITECH. **HITECH** has been described as “HIPAA on steroids” because in it the Department of Health and Human Services (DHHS) greatly expands HIPAA coverage through increased compliance regulations, increased privacy regulations, and strengthened enforcement penalties relating to patient health records in EHR and Practice Management Systems. Always remember that PHI is protected, regardless of the format in which it is maintained. PHI cannot be shared with anyone without a “business need to know,” unless the patient gives express written permission to share the information with that individual.

TABLE 12-1 Basic Differences Between Electronic Health Records and Personal Health Records

Description	EHR	PHR
Record ownership/management	EHR files are owned and managed by providers or facilities.	PHR files are owned and updated by the individual.
Legal document?	EHR are legal documents regulated by state and federal laws.	PHR are not legal records and have no legal regulations.
Information access	EHR access is controlled by the provider with patient authorization.	PHR access is controlled by the patient.
Providers involved	In general, EHR contain information related to treatment by one provider.	PHR contain treatment information from multiple providers.
Data entry	EHR data are entered by providers or their staff.	PHR data are entered by the patient.
Information users	EHR is used by the medical office or facility.	PHR is used by the individual patient.

► Meaningful Use and the EHR LO 12.3

It is impossible today to work in the healthcare industry and not hear the term **meaningful use** tossed out when speaking of electronic health records. Health IT.gov (<http://healthit.gov>) defines meaningful use in this way:

Meaningful use is using certified electronic health record (EHR) technology to:

- Improve quality, safety, efficiency, and reduce health disparities
- Engage patients and family
- Improve care coordination, and population and public health
- Maintain privacy and security of patient health information

It is believed that compliance with EHR programs, which support the healthcare reform tenets of the Affordable Care Act (ACT) and follow government interoperability mandates for these programs, will eventually result in better patient care, which in turn will produce the following outcomes:

- Better clinical outcomes
- Improved population health outcomes
- Increased transparency and efficiency
- Empowered individuals
- More robust research data on health systems

Let's look at each one of the hoped-for outcomes in more detail to see why EHR are considered a "core" of medical care today and in the future.

Better clinical outcomes occur when medical record documentation is clear, concise, and complete; it is easy to see what treatments work best for a patient's situation. When that documentation can be shared (PHI being omitted) with other qualified practitioners and researchers, better clinical outcomes for more patients will become possible.

Improved population health outcomes will be a natural progression from the shared knowledge of better individual outcomes. As clinicians and researchers better understand what makes us ill, the prevention and treatment of illnesses for affected populations will result.

Increased transparency and efficiency will result from the accessibility of shared records, and the results of treatment plans will be shared among practitioners, causing efficiency in the process. There will be less "reinventing of the wheel"

as more and more information is available for all practitioners regarding treatment protocols.

Empowered individuals will result from knowledgeable patients and families. *Shared data* means that patients will have access to the "track records of licensed practitioners" to allow them to choose the best provider for their needs, answers to questions such as these: Where is the best facility for treating breast cancer or leukemia? Who is most successful in helping patients and families with alcohol and substance abuse issues? Where is the most research being done on current health issues facing single parents or adult caregivers of elderly parents? All of these questions can be answered through the sharing of electronic health information. By sharing information with patients regarding their risk factors, illness, and treatment options, practitioners are engaging patients in medical decisions. Patients who are engaged partners in their care are more likely to adhere to the agreed-upon care plan when they understand the reasoning behind what they are being asked to do. Likewise, when caregivers listen to their patients, the results are more positive for the patient experience, regardless of the ultimate treatment outcome.

At the time of this writing, the government initiative through the Centers for Medicare and Medicaid Services (CMS) had recently delayed the end date for Stage 2 of its EHR implementation program to 2016. Stage 1 focused on data capture and sharing of information; Stage 2 focuses on advanced clinical processes; and Stage 3, which is still to be finalized, is due for implementation in 2017 and will focus on improved outcomes. Stage 3 will use the following criteria for this focus:

- Improving quality, safety, and efficiency, leading to improved health outcomes
- Decision support for national high-priority conditions
- Patient access to self-management tools
- Access to comprehensive patient data through patient-centered health information exchange (HIE)
- Improving population health

As Stage 3 for the EHR initiative is still in process at this time, users and participants of EHR programs will have to wait and see exactly what criteria they will have to meet in order to obtain these governmental objectives. Figure 12-2 shows a typical "dashboard" in an EHR program allowing providers to track their progress in meeting the attestation measures required during each reporting period.

FIGURE 12-2 Built into Practice Fusion's® EHR software is a reporting system that allows you to check your practice's progress toward achieving the various stages of meaningful use.
© Practice Fusion®

Advantages and Disadvantages of EHR Programs

LO 12.4

The government and proponents of EHR programs talk about all the advantages, but there are those who are reluctant to implement EHR. Let's take a look at the pros and cons of EHR programs.

Advantages of EHR Programs

Some of the advantages of EHR programs are

- Fewer lost medical records (charts do not require pulling or refiling).
- Eliminated (or reduced) transcription costs.
- Increased readability/legibility of charts.
- Ease of chart access for multiple users.
- Chart availability outside of office hours.
- Increased access to patient education materials.
- Decreased duplication of test orders.
- More efficient transfer of records.
- More efficient billing processes using electronic billing methods.
- Greatly decreased storage needs.

FIGURE 12-3 Electronic health records and a laptop computer with Internet access provide practitioners with easy record access no matter where they are.
© JGI/Blend Images LLC RF

In addition to these advantages, a fully functioning EHR program presents other advantages. If a practitioner is at home and needs to access a patient's record, he can access the EHR program from any computer (using his secure access code and password) at any time, review or update the file, and save it to the central computer. See Figure 12-3.

Computerized records also can be used in teleconferences, where people in different locations can look at the same record on their computer screens at the same time. Computer access to patient records is also helpful for healthcare providers with satellite offices in different cities or different parts of a city, and access may be used by a physician who is covering a practice while the patient's usual doctor is out of town.

Disadvantages of EHR Programs

Cost is the primary reason most providers give for not implementing electronic records in their offices. The estimated cost to establish an EHR program is \$44,000 per full-time provider (FTP), with an estimated maintenance cost of \$8,500 per year per FTP. Some practices do not have the initial financial outlay available, or feel the time needed to recoup the initial cost to implement the program does not justify the initial financial outlay. Aside from financial concerns, other reasons for not implementing electronic health records include

- Staff training requirements.
- Possible need for a full-time or part-time IT staff member.
- Possible damage to the system and to software and/or required upgrades.
- Existing programs do not fit the needs of the practice.

▶ Working with an Electronic Health Record

LO 12.5

By now, you are beginning to understand some of the EHR advantages. As a medical assistant concerned with patient care and patient confidentiality, you should also understand that the basic rules for working with a medical record do not change when that record is electronic instead of paper. The way you work with the record may change, but the way you treat a record does not. You may refer back to the chapter *Written and Electronic Communication* regarding the basic rules of working with a patient medical record.

General Guidelines for Using an EHR Program

As a medical assistant working with electronic records, you should keep the following in mind:

- Become familiar with the software and hardware used at your facility. Make sure you are not focused on the computer when you are with a patient. Becoming comfortable with the system you are using will help you to focus on the patient. If necessary, take notes and enter them into the computer when the patient is not present until you become comfortable.
- Retrieve the patient record carefully, just as you would with a paper record. Make sure you have identified the patient with at least two identifiers such as the name, date of birth, and/or medical record number.

- Keep your password information secure. Change your password on a regular basis or as directed by the healthcare facility.
- Secure the computer that maintains the electronic records and keep a backup of electronic files.
- Check your entries carefully before hitting the enter button. An EHR is a legal document just like a paper chart. What is written in the chart occurred, and what is omitted from the chart did not occur.

In addition to these guidelines, many medical record software programs use abbreviations in medical records that may or may not be used in a paper record. Common abbreviations in EHR programs include

PX for physical exam

SX for symptoms

RX for therapy, treatment, and/or prescriptions

DX for diagnosis

Additionally, because of their ability to incorporate multimedia, graphs are commonly used to track ongoing results such as BP readings, weight, recurring lab results (such as cholesterol or blood sugar), or even photos with measurements to track skin lesions. Be sure you learn and understand how to update the multimedia documents as well as how to work with the standard patient record format.

Another positive in many EHR programs is the ability to enter alerts into a patient's record to remind the practitioner if the patient is due for periodic testing such as a mammogram or colonoscopy. They can also be set up to alert the healthcare provider to abnormal test results, so that the patient can be contacted or counseled. More sophisticated programs can even document health trends, provide voice recognition, and convert notes to complete sentences.

Creating a New Patient Record Using EHR Software

Keep in mind that even though EHR programs will eventually be required to communicate with each other and they are similar in many ways, there will be differences. With practice and time, you will become an expert in your office's EHR program. All programs will have a template that will require completion for each new patient. Included in that template will be *required fields*, like the patient's name, date of birth, address, next of kin, sex, and insurance information (Figure 12-4). This information is sometimes part of a **face page**, also known as a **face sheet**, which provides an overview, or "snapshot," of patient demographic information in an EHR system. However, the way you complete these fields will vary with each software package. Procedure 12-1 at the end of this chapter outlines the basic procedure for creating a new patient record using an EHR program.

Correcting an Electronic Health Record

As you learned in the previous chapter, when correcting a paper medical record, you neatly draw a line through the error and make the correction as close to the original entry as possible. Obviously, once information is saved in an electronic

FIGURE 12-4 Screen shot from Practice Fusion®, showing Shenya Jones being added as a patient.
© Practice Fusion®

format, a line cannot be drawn through it. In fact, because electronic medical records are legal documents, once information has been saved, it cannot be changed in any way (which is why you want to double-check your work prior to clicking “save”). When an error or omission is found in an electronic record, an addendum to the omitted or incorrect information is made as soon as possible once the error or omission is noted. If an error is noted in a previous entry, many programs allow a note to be inserted at the original entry, telling the user to look at a further entry in the record for the corrected information. Procedure 12-2, found at the end of this chapter, outlines basic steps to make an addendum using an EHR program.

► Other Functions of EHR Programs

LO 12.6

In addition to the obvious advantages of electronic health records, all interoperable EHR programs have numerous other capabilities. When EHR programs have numerous capabilities, in addition to creating and storing medical records, they are often referred to as **Practice Management Systems**. Let’s look at some of the common options for practice management and EHR programs.

Tickler Files

As stated earlier, many electronic health record programs have the capability to act as tickler files (files that need periodic attention). For example, they can alert staff members about patients who are due for yearly checkups and patients who require follow-up care. Some hospitals have begun to use electronically scanned images of patient thumbprints or photos to keep track of records. This also assists with patient security by identifying the patient at the time of each visit, which can cut down on insurance fraud. This system saves time and helps maintain patient record security. (Review the

Office Equipment and Supplies chapter for more information on computer use in the medical practice.)

Specialty Specific

Once you become accustomed to reading a medical record and documenting in it, you will begin to notice there are similarities in many of the records within any specific specialty. Cardiologists use certain terms like *cardiomegaly*, *congestive heart failure*, *echocardiogram*, and *hypertension* in many of their medical records. On the other hand, an OB/GYN would seldom use those terms, but you would see terms and abbreviations like *LMP*, *gravid*, *para*, and *C-section* in these records. Similarly, when dictating or documenting a physical exam or writing up an operative summary, physicians, like all of us, are creatures of habit and frequently use the same phrases time and time again. Recognizing this, EHR software programs may be **customized** to suit a specific specialty and style of a physician’s office. Often, templates or “checkoffs” are available, so with a few simple clicks of the mouse, the physician may add entire sentences or phrases, instead of typing the same information repetitively—saving time and cutting down on errors.

Electronic Schedulers

When working with a paper appointment book, only one user at a time may make appointments. If a staff member is using the appointment book and a patient calls about an appointment, the patient on the phone must wait for the appointment book to be free before she can be assisted. Ever forget the date of an appointment? In a traditional paper book, the scheduler must go page by page in order to find the forgotten appointment—inefficient at best! Electronic schedulers (Figure 12-5) have several advantages over the traditional appointment book. Multiple users may use them at any time. Depending on the software package you are using, if you need to find a patient’s appointment, you can search by the patient’s name or even look up the patient’s record and the date of the

FIGURE 12-5 Electronic scheduler program in Practice Fusion®.
© Practice Fusion®

next appointment in the record. In addition to these tasks, electronic schedulers can keep a listing of patients who want an earlier appointment if one becomes available and allow you to search for appointments by time frame needed or by appointment type needed (like a complete physical or a BP check).

One disadvantage of electronic schedulers is the fact that if the computer is down, appointments cannot be made and the day's schedule is not accessible. So it is always a good idea to print out a copy of each day's schedule at the beginning of the day. Some offices also keep a backup appointment book handy in case of power failure. Some EHR scheduler programs also include appointment reminder and confirmation programs to automatically remind patients of their appointments. These programs then give patients the option to either confirm attendance or change the appointment by phone or online. Procedure 12-3 outlines the steps in creating an electronic scheduler appointment matrix. Procedure 12-4 outlines the process for booking a patient appointment using an electronic scheduler.

Eligibility Verification and Referral Management

It is always wise—before performing any procedure—to verify the patient's insurance coverage. Many Practice Management programs make this process easier by assisting with online insurance verification. In addition to verifying

coverage, most programs also allow for capturing the patient's demographic information at the same time.

Many managed care programs require the patient's PCP to provide any specialist with a referral before the specialist can see the patient and before most procedures can be performed. Most EHR software programs not only allow the physicians to readily share information about the patient via the software package but also allow for electronic transmission of referrals among the PCP, the specialist, and the insurance plan involved. In addition, the number of visits allowed by the referral, the time frame involved, and the number of visits left on any given day can be tracked within the patient's medical record.

Billing and Coding Software

Many Practice Management Systems and EHR programs include billing and coding software, allowing for electronic coding of medical records, and electronic claims submission to insurance carriers. Depending on the software program being used, the procedure and diagnosis codes may be automatically chosen by the software program based on the medical record or may be coded and inserted manually by the office medical coder (Figure 12-6). Alerts to the system may be added, so if a charge does not match a diagnosis code, a flag is produced. An example would be a patient is seen for a skin biopsy, but the only diagnosis for the visit is hypertension.

The screenshot shows the Practice Fusion interface for patient Chris Matthews. The main window displays the patient's profile with tabs for Summary, Timeline, and Profile. The left sidebar contains navigation options like Home, Schedule, Tasks, Charts, Messages, and Reports. The main content area shows the 'Diagnoses' section with a list of chronic diagnoses, including '(110.4) Tinea pedis'. Below this, there are sections for Allergies (Drug, Food, Environmental) and Medications. A table lists medications: Sertaconazole Nitrate (Ertaczo) 2 % External Cream and Terbinafine HCl 250 MG Oral Tablet. A 'Diagnosis > Record diagnosis' modal window is open on the right, showing fields for Search for diagnoses, Start Date, Stop Date, Acuity, Medications, Diagnosis Comment, and Attach diagnosis to this encounter.

Diagnosis > Record diagnosis

Search for diagnoses: (110.4) Tinea pedis

START DATE: 04/03/2015 Today

STOP DATE: mm/dd/yyyy Today

ACUITY: ☒ Acute ☐ Is terminal

MEDICATIONS: Record medication

- Terbinafine HCl 250 MG Oral Tablet
- Ertaczo 2 % External Cream

DIAGNOSIS COMMENT: Enter a comment about this diagnosis

☒ Attach diagnosis to this encounter

COMMENT FOR THIS ENCOUNTER: Enter a comment about this diagnosis for the current encounter

RESOURCES: MedlinePlus, Patient education materials

Buttons: Cancel, Done

FIGURE 12-6 Practice Fusion® screen shot of office visit details for Chris Matthews, including diagnoses addition fields.
© Practice Fusion®

Because hypertension is not a reason to do a skin biopsy, an alert would appear stating the diagnosis does not meet medical necessity guidelines. Even if an electronic coding program is being used, an experienced coder should perform random internal coding audits several times a year to ensure that coding is being performed correctly. Once coding is completed, the electronic claim is submitted to the insurance carrier.

Once the insurance carrier has paid the claim, most programs also include a patient billing component so the administrative staff can produce a billing statement for the patient. This statement lists the total amount of the charges, the amount paid by the insurance plan, deductibles, and the co-payment or coinsurance balance due from the patient. You will learn more about medical billing and coding in the chapters covering these subjects later in this text.

Report Generators

Most EHR programs also include a report generator, also known as a report writer. This part of the EHR program extracts information from one or more of the patient files and presents that information in a specific format to be used for other purposes. Multiple files are accessed that meet certain conditions. Reports can be used for things such as

research or billing and accounting. Report formats may be preset or you can create your own report to reuse when needed. The types of reports that may be produced include:

- Patient demographics
- Office accounts receivable (A/R) and accounts payable (A/P)
- Office statistics (including the number of individual procedures done during a specified time frame)
- Revenue generated by specific procedures
- Other tracking mechanisms to assist the office business manager in tracking both profitable and nonprofitable procedures for the practice
- Patient and insurance carrier aging reports (reports of unpaid invoices arranged according to how long ago the invoices were generated) to see who is or who is not paying the office claims and statements promptly

Electronic Prescriptions

To encourage the use of electronic prescribing and EHR programs, Medicare and Medicaid offered e-prescribing incentives, and now virtually all EHR programs include prescription writers. These programs allow entry of prescriptions, which may

be transmitted directly to the pharmacy or printed and given to the patient. Lists of the most common medications (and dosages) prescribed by the physician also may be kept in the program. Because the program communicates with the patient's individual medical record, any allergies can cause a flag for an ordered prescription; possible medication interactions will do the same.

Ancillary Order Integration

Many EHR programs also include ancillary programs for labs, X-rays, and other diagnostic and therapeutic services. Orders can be submitted to the lab or ancillary office electronically at the time the patient appointment is made. Once testing is complete, the results of the test(s) are transmitted back to the office as soon as they are available, allowing for immediate upload to the patient's medical record. This greatly cuts down on patient and physician wait time for results. Additionally, results may be faxed, scanned, or e-mailed as necessary.

Patient Access

Most patients today are technically quite savvy. In fact, many prefer most communication to occur through electronic means instead of spending telephone time on hold or waiting for someone at the office to be free to make an appointment or provide routine information. Recognizing this, many EHR packages and offices provide patient portals so that a patient can access routine information and perform routine tasks, like making an appointment, accessing a child's immunization record, or even paying a balance on his or her account, online.

► Security and Confidentiality and EHR

LO 12.7

When medical records are kept electronically, it is essential that the facility have policies in place to ensure the security and confidentiality of records. As already discussed, all users of the EHR program will have individual access codes and passwords. The access code will allow each user access to only the areas of the record to which the user is entitled, based on his or her job description. Additionally, these access codes insert a date and time stamp within the medical record, including the user's initials, so that office administration and the patient (if requested) may know who is accessing each medical record.

The office also should have a written procedure in place to document when someone requests information from the patient file, if the patient has given permission to release that information, and when it was released. When requested by the patient, this listing must be provided as part of the HIPAA privacy and security act. Protecting the confidentiality of patient records in computer files is the greatest concern of electronic

health records. Electronic health records should be kept just as secure as paper records are kept.

Remember, too, that whether you are documenting by hand or electronically, accuracy is always important. Careful key entry is essential to maintaining accurate electronic health files, to protect both the patient and the medical office. In addition, processes must be in place to back up electronic files on a regular basis to avoid accidental data loss.

Reassuring Others about EHR Confidentiality and Security

As the office medical assistant, it will often be part of your job to reassure patients and other staff members that the office EHR program and the information it contains are confidential and secure. There are several ways you can do this.

- Be knowledgeable about all the confidentiality and security aspects of the office EHR program.
- Never display negativity about the new program, even when things don't go "exactly right" when you are using it. Remember, there is a learning curve with every new process. Remain patient and interested in the process.
- Suggest the office create a pamphlet or flyer for the patients regarding the office EHR program and assist in preparing the document for the patients.
- When working in the program, show the patient his own medical record and how information is entered, maintained, and saved, including the backup process. Explain the security systems that are in place in easy-to-understand terms to reassure the patient that his medical information is accurate, safe, and secure.
- Explain the office access process to the patients, including the fact that they may view the list of people or companies (like insurance carriers) who have accessed their information, when the access took place, and why.

Overall, the benefits of electronic health records far outweigh the consequences, and with the federal government stepping in to mandate the conversion to EHR, change is inevitable. As the office medical assistant, always be willing to learn any new process, including EHR; assist others with their learning process; and help the patients understand that EHR will only improve the healthcare they receive from your office.

PROCEDURE 12-1 Creating a New Patient Record Using EHR Software

Procedure Goal: To create a new patient record using EHR software

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Initial patient forms (patient information, advance directives, physician notes, referrals, and laboratory orders)

Method:

1. Open the Practice Fusion® Program and, from the Practice Dashboard, choose “Charts” from the task choices listed down the left side of the screen.
2. Click the “Add Patient” button in the upper-right corner
3. Using the initial patient forms completed by the patient, complete the patient demographic information fields one at a time. Be sure to spell the patient’s name correctly.
RATIONALE: *This is a legal record. The information must be entered correctly.*
4. Any field marked with an * is a required field. For instance, mobile phone number and e-mail address are required. If the patient does not have an e-mail address, check the box below this field stating “Patient doesn’t have an email address.”

RATIONALE: *A required field is considered essential information by the practice, so the field cannot be skipped.*

5. Continue completing fields, including those for guarantor and insurance information. The guarantor will be the patient unless the patient is a minor.

RATIONALE: *The guarantor is the person legally responsible for paying the patient’s medical bills.*

6. Carefully inspect all information for accuracy and save the new patient record by clicking the “Save” button at the top right of the screen. If for any reason you do not want to save the information, click the “Cancel” button at the top right of the screen.

RATIONALE: *This information will become part of the patient’s permanent medical record. Proofread all information and verify accuracy before striking “Save.”*

7. Depending on office policy, information from a hardcopy medical record may be scanned into the EHR or a manual file created to maintain it. Follow your office procedure for filing this information.

RATIONALE: *All patient information must be readily available for healthcare providers when required for patient care.*

PROCEDURE 12-2 Making an Addition or Addendum (Correction) to an Electronic Health Record

Procedure Goal: To follow standard procedures for correcting or making an addendum to an electronic health record

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Access to the patient’s EHR and other pertinent documents containing the information to be used in making corrections (for example, handwritten notes, telephone notes, physician comments, correspondence, or test results)

Method:

1. Open the Practice Fusion® Program and, from the Practice Dashboard, choose “Charts” from the task choices listed down the left side of the screen.
2. From the patient roster that appears, click the patient whose record requires attention.

RATIONALE: *Be sure to open the correct record, or another correction will be required later.*

3. From the right side of the screen, click the date for the note requiring the correction or addendum.

RATIONALE: *Be sure to select the correct date to avoid making additional errors.*

4. Choose the area of the record requiring the changes. Make the required changes and then click the “Done” button to save the changes.

RATIONALE: *If “Done” is not selected, the change will not be saved within the health record. The user’s identity and date will automatically be stamped on the record for further reference.*

5. Back at the main screen for the patient, click “Save” at the top-right corner to finalize changes made to the record.

PROCEDURE 12-3 Creating an Appointment Matrix for an Electronic Scheduling System

Procedure Goal: Using an electronic scheduling system, to indicate the days and times when the office is not scheduling appointments

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Electronic scheduling program; physician schedule of meetings, conferences, vacations, and other times of unavailability, including staff meetings and hours when patients are not seen

Method:

1. Open the Practice Fusion® Program and, from the Practice Dashboard, choose “Schedule” from the task choices listed down the left side of the screen.
2. Choose the calendar icon at the top-right corner of the screen and from the calendar that appears, select the month and day requiring the change.
3. Click “Add Appointment.” From the options that appear, choose “Block Time.”

RATIONALE: *When creating the matrix, this choice allows you to put in a reason without choosing patient information.*

4. Using the drop-down arrows, complete information for the following fields: When (date), Duration (amount of time), and Repeat (or never).
5. The next field is Reason. Use the drop-down menu to specify why patients will not be seen in this time frame. The choices are lunch, meeting, miscellaneous, out of office, surgery, and vacation. This is a required field.

RATIONALE: *The reason that the time will not be used for patients will appear in the schedule for future reference.*

6. In the Description field, enter a short description regarding the reason patients will not be seen. This will be viewed by anyone looking at the schedule.
7. If any notes are needed about this blocked time, they may be added to the Notes area.
8. When all information is completed, click the “Done” button at the lower-right corner of the block time fields to save the information to the scheduler.

PROCEDURE 12-4 Scheduling a Patient Appointment Using an Electronic Scheduler

Procedure Goal: Utilizing the previously created matrix, to book patient appointments, applying the correct amount of time for each appointment

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Electronic scheduler and template outlining time frames for patient appointment types

Method:

1. Establish the type of appointment required by the patients, particularly noting if the appointment is for a new patient or an established patient.

RATIONALE: *In general, new patient appointments take longer time frames than do existing patient appointments.*

2. If needed, consult the office template for the amount of time required for the patient appointment. Keep in mind the reason for the appointment, as that may affect timing.

RATIONALE: *If a patient is required to be fasting, for example, the appointment should be made earlier in the day and not in the afternoon.*

3. When possible, schedule appointments earlier in the day first, and then move to later time frames. Do ask if the patient has a preferred time frame and, if possible, honor the request.

4. Open the Practice Fusion® Program and, from the Practice Dashboard, choose “Schedule” from the task choices listed down the left side of the screen.
5. Click “Add Appointment.” From the options that appear, choose “Patient” and enter the first few letters of the patient’s last name.

RATIONALE: *This allows you to enter the name of a new patient, or once you enter a few letters of an existing patient, choose the correct patient from the drop-down list.*

6. Enter the chief complaint given by the patient and choose the required “visit type” from the drop-down menu. Enter the length of the visit from the drop-down menu in the next field.

RATIONALE: *The visit type is required to give the provider an idea of the type of visit scheduled.*

7. If the appointment is to be a repeated one, check the “Repeat” box and complete the fields that appear to specify when and how often the patient will be seen.

RATIONALE: *This makes it easier to complete multiple appointments for a patient at one time.*

8. When all information is completed, click the “Save” button at the lower-right corner of the screen to save the appointment and enter it into the schedule.

S U M M A R Y O F L E A R N I N G O U T C O M E S

LEARNING OUTCOMES	KEY POINTS
12.1 List four medical mistakes that will be greatly decreased through the use of EHR.	Medical mistakes that will be greatly decreased or eliminated with EHR include lost or misfiled paper records, mishandled or “forgotten” patient messages, inaccurate or unreadable information in a paper medical record, and mislabeled or unreadable laboratory or prescription orders.
12.2 Differentiate among electronic medical records, electronic health records, and personal health records.	The electronic medical record is an electronic record of health-related information for an individual patient that is created, compiled, and managed by providers and staff members located within a <i>single</i> healthcare organization. An electronic health record is created, managed, and gathered in a manner that conforms to nationally recognized <i>interoperability standards</i> , so that members of more than one healthcare organization can utilize it. A personal health record is an electronic version of the comprehensive medical history and record of a patient’s lifelong health that is collected and maintained by the individual patient.
12.3 Explain the concept of meaningful use, identifying at least two of its goals.	<i>Meaningful use</i> describes EHR as improving quality, safety, and efficiency, reducing health disparities. It engages the patient and family as well as improves coordination of care for population and public health. Maintenance of privacy and security of PHI are also required. The goals include better clinical outcomes, improved population health outcomes, increased transparency and efficiency, empowered individuals, and more robust research data on health systems.
12.4 Contrast the advantages and disadvantages of electronic health records.	Advantages of EHR include fewer lost medical records, elimination of transcription costs, increased readability/legibility of charts, ease of chart access for multiple users, chart availability outside of office hours, increased access to patient education materials, decreased duplication of medical tests, more efficient records transfer, more efficient billing processes using electronic billing methods, and decreased need for storage space. Disadvantages include cost, need for training, possible need for F/T or P/T IT personnel, and need for computer hardware/software upgrades or changes.
12.5 Illustrate the steps in creating a new patient record and correcting an existing record using EHR software.	The same rules apply for EHR as for paper-based medical records when initiating or documenting in a patient’s electronic health record. Follow the basic steps in Procedure 12-1 for setting up a new patient EHR and 12-2 for correcting or making an addition in an existing patient’s electronic health record.
12.6 Describe some of the capabilities of EHR software programs.	Aside from housing patient electronic health records, many EHR programs also can perform the following functions: tickler files, specialty-specific software, electronic scheduler, eligibility verification and referral management, billing and coding capabilities, report generation, electronic prescriptions and ancillary order integration, and a patient access portal.
12.7 Explain how you might alleviate a patient’s security fears surrounding the use of EHR.	Be knowledgeable on all aspects of the office EHR program and never display a negative attitude about it. Assist in preparing written information for the patients regarding the EHR program, including how the patient’s medical information will remain confidential and secure. When the patient is in the office, offer to show the patient his EHR, and explain how information is added, entered, maintained, and kept secure. Understand and be able to explain the backup process for the EHR program. Understand the office access policy as it pertains to HIPAA, and explain it to the patients.

CASE STUDY CRITICAL THINKING

© McGraw-Hill Education

Recall Ken Washington from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding his case.

1. How will you explain the benefits of using electronic health records to Ken Washington?
2. The screen Ken Washington has seen displays only the screen saver for the new EHR program. What precautions should be taken to ensure that patients do not see another patient's information on the computer monitor?
3. The practice you for work for wants to review all of the patients who have similar problems as Ken Washington. What function of the EHR program would you use, and what problems would you search for?

EXAM PREPARATION QUESTIONS

1. (LO 12.1) Medical errors in the United States are calculated to be the _____ leading cause of patient death.
 - a. 2nd
 - b. 4th
 - c. 6th
 - d. 8th
 - e. 10th
2. (LO 12.2) Patient electronic health information created in a format meeting *interoperability standards* is defined as being in a(n) _____ format.
 - a. EMR
 - b. EHR
 - c. PHR
 - d. EMR or EHR
 - e. None of these
3. (LO 12.2) An individual's lifelong health record is a(n)
 - a. EMR
 - b. EHR
 - c. PHR
 - d. Any of these
 - e. None of these
4. (LO 12.3) What is the ultimate goal of EHR implementation and meaningful use?
 - a. Ability to read practitioner notes
 - b. Replacement of transcriptionists
 - c. Selling of more Practice Management Systems
 - d. Better patient care
 - e. Better care of at-risk populations
5. (LO 12.3) Part of meaningful use is to empower patients and families. How is that to happen?
 - a. Patients should be given reading material
 - b. Providers should make sure patients understand all their options
 - c. Patients should be given websites to look up information
 - d. Patients should be given material and providers should make sure patients understand all of their options
 - e. All of these
6. (LO 12.5) Many EHR programs use the term _____ for a correction made to an electronic health record.
 - a. Deletion
 - b. Error
 - c. Addendum
 - d. Omission
 - e. Correction
7. (LO 12.6) Which of the following functions of the EHR program will be most helpful to the administration when reviewing the financial health of the practice?
 - a. Report generator
 - b. Tickler file
 - c. Billing/coding
 - d. Electronic scheduler
 - e. Specialty-specific programs
8. (LO 12.6) Which of the functions of the EHR program would be most helpful to the staff who schedules appointments for patients with specialists?
 - a. Billing coding
 - b. Specialty-specific programs
 - c. Ancillary order integration
 - d. Electronic prescriptions
 - e. Insurance verification
9. (LO 12.7) Which item maintains each user's ability to work in certain areas of a patient's electronic health record?
 - a. Password
 - b. Access code
 - c. Confidentiality
 - d. HIPAA
 - e. None of these

10. (LO 12.8) Which of the following will *not* reassure patients about the privacy and security of the office EHR system?
- Showing the patient how information is entered in his or her medical record
 - Being knowledgeable about the security of the office EHR system
 - Sharing “computer frustrations” with the patient
 - Explaining how the backup system for the EHR program works
 - Assisting in the creation of a pamphlet for the patients regarding the new office EHR system

Go to CONNECT to see activities about *Reviewing a Face Sheet*, *Correcting Errors in EHR*, *Creating an Electronic Schedule Matrix*, and *Scheduling a Patient Appointment*.

S O F T S K I L L S S U C C E S S

Recall Ken Washington from the case study at the beginning of the chapter.

1. You have just assured Ken Washington that his medical information will be safe on the office's new EHR system. As he is checking out, the administrative assistant, who had been looking up something in his record for the physician, leaves her station momentarily, just as Ken walks by. He sees his record up on the screen and is upset. What should you say to Ken?

2. As a follow-up to the incident that occurred with Ken Washington, you have been asked to create a poster for the lounge to help remind the providers and staff on a regular basis of policies related to the use of the new EHR. What things should you include?

Go to PRACTICE MEDICAL OFFICE and complete the module Admin: Check Out – Privacy and Liability.

Managing Medical Records

CASE STUDY

EMPLOYEE INFORMATION	Employee Name	Position	Credentials
	Malik Katahri	Office Manager	CMM
EMPLOYEE INFORMATION	Supervisor	Date of Hire	Other Information
	BWW Physicians	04/20/20XX	Meetings with EHR vendors with week

Malik Katahri is the office manager for BWW Medical Associates, PC. The number of patients the office sees is growing at an amazing rate and although good for the practice, it is taxing the current alphabetic filing system. Malik and the office staff have been discussing the pros and cons of converting to a numeric filing system or possibly doing away

© HBSS/Corbis RF

with paper records totally and moving toward a more progressive EHR program. The physicians are reluctant to commit to an EHR program related to the financial outlay and staff training time required.

Keep Malik in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

LEARNING OUTCOMES

After completing Chapter 13, you will be able to:

- 13.1** Identify the common equipment used to file and store paper medical records.
- 13.2** Outline the security and safety measures that should be employed when working with paper medical records.
- 13.3** List the common filing supplies used in the medical office.
- 13.4** Contrast the methods used for various filing systems and how color-coding can assist with the filing systems.
- 13.5** Recall the steps in the filing process.
- 13.6** Compare active, inactive, and closed files and how to set up a records retention program for the office.

KEY TERMS

- active file
- alphabetic filing system
- closed file
- coding
- compactible file
- cross-referenced
- file guide
- inactive file
- indexing
- indexing rules
- indirect filing system
- inspecting (conditioning)
- lateral file
- middle digit

► Introduction

One important administrative function of the medical assistant is the careful management of the patient medical records. The information contained in these records is the most valuable information in a medical office. For a practice using paper medical records to operate smoothly and efficiently, it is critical that these records be organized in a way that makes them easily retrievable. Maintaining a well-organized, easy-to-use **records management system** (the way patient records are created, filed, and maintained) is essential to providing good patient care.

You learned about management of EHR in the *Electronic Health Records* chapter. In this chapter, you will explore the various options for handling large volumes of paper medical records and learn how to develop an organized approach to maintaining these critical files. As you read, watch for helpful tips to locate and access patient records quickly and efficiently.

► Filing Equipment

LO 13.1

Filing equipment generally refers to the place where records, or files, are housed. Although there are various types of equipment, two of the most common options are shelves and cabinets. The choice of whether to use filing shelves or filing cabinets is often made according to space considerations and personal preference. Most offices already have a filing system in place before you are hired, but you may be involved in filing decisions if the practice grows or opens a satellite office. When making any equipment decision, keep in mind that any choice must take into consideration space constraints and the needs of a growing practice. To protect PHI contained within the files, the equipment must be fireproof and secure.

Filing Shelves

Filing shelves resemble traditional shelves, as shown in Figure 13-1. Many shelf systems have doors that slide from side to side or slide out from above the files. These doors can be locked for security. Filing shelves are often long, sometimes

extending the full length and height of an office wall or room, which allows several people to work in the file area at the same time.

Filing Cabinets

Filing cabinets are sturdy pieces of office furniture, usually made of wood or metal. They contain a series of drawers in which files are hung. They come in two styles:

- **Vertical files**, which are taller with narrow drawers that are approximately the width of a standard file folder
- **Lateral files**, also known as horizontal files, which have wider drawers that are usually split into three or four sections, allowing more files to be stored in each drawer (see Figure 13-2)

The drawback of each of these file cabinets is the fact that for safety reasons, only one drawer may be pulled out at a time (so the file does not fall over on the user), which means only one person at a time can access the file cabinet. For more information on patient and staff safety in all aspects of the medical office, refer to the chapter *Safety and Patient Reception*.

Compactible Files

Many offices have limited space in which to house filing cabinets or shelves. These offices may choose to use a variation of shelf filing called **compactible files**. Compactible files are kept on rolling shelves that slide along permanent tracks in the floor.

When not in use, these files can be stored close together—even one on top of another—to conserve space. When needed, they can be rolled out into an open area so that the staff can easily use them. Compactible files can be moved manually or automatically with the touch of a button.

Rotary Circular Files

Rotary circular files are another option to consider when space is limited. These files are stored in a circular fashion, similar to a revolving door, and are accessed by rotating the files. They also can be operated either manually or electronically.

Labeling Filing Equipment

Regardless of which type of filing equipment your office uses, files should be clearly labeled on the outside of the drawer so that you do not have to open doors or drawers to know the contents. When labeling storage boxes (such as may be used for inactive records), use a permanent marker to clearly label the contents of the box. Writing directly on the box removes any possibility of a label falling off a box while in storage. If the contents may one day be destroyed, the destroy date should also be included in the labeling. For example, the label may read as follows:

Medical Records Last Names A–D. Date Last Seen
01/01/XX-06/30/XX. Destroy date: 12/31/XX

Record retention schedules will be discussed later in the chapter.

Security and Safety Measures

LO 13.2

All filing systems must be secured under HIPAA privacy and security regulations. HIPAA states that there must be a “reasonable safeguard” to protect health information from any disclosure, whether intentional or unintentional. Using locking, fireproof filing cabinets to store patient records is an important element of this requirement. *Never* place patient records in an unsecured filing system. Additionally, both staff and patients must be safe when using and being around the office filing system.

Medical Record Security

Today’s filing cabinets come with a lock and key. Cabinets that are not in a separate room should be locked every night when the office is being closed for the day. To protect filing shelves in a separate room, you can lock the file room. Security of the keys to that room then becomes an important issue. The number of staff members who have keys to that room should be limited—perhaps to just the healthcare providers and the office manager. When the office manager comes into the office each morning, she can unlock the files. Because the files remain open during the day, it is important to make sure they are not placed in areas where unauthorized people can obtain access to them. Posting a sign on the file room door stating “Authorized Personnel Only” helps ensure that files remain secure. To ensure office security after hours, some practices install alarm systems.

Keys and locks bring a measure of security only when they are *used*. Do not become lazy and neglect to lock filing cabinets and file rooms when leaving the office for the day. Security survey teams will always ask to see the keys to any locked door or cabinet and ask the staff to demonstrate that they work. Within a medical office, conducting regular security drills at the same time that fire drills are held will aid staff in staying sharp and aware of security risks.

► Filing Supplies

LO 13.3

Once you have chosen your filing equipment, the next step is selecting filing supplies. Figure 13-3 features an assortment of filing supplies commonly used by medical practices.

File Folders

The most basic filing supply is the file folder, often referred to as a manila folder. This folder is made of heavy paper folded in half to form a pocket that can hold papers. File folders come in two sizes: letter size, which is $8\frac{1}{2} \times 11$ inches, and legal size, which is $8\frac{1}{2} \times 14$ inches.

Tabs The tapered, rectangular or rounded extension at the top or side of the folder is called the tab. Tabs may extend the full length of the folder, as with straight-cut folders, but more often they are cut to extend partway across a folder.

Using folders with a variety of tab locations makes it easier to read the names on the tabs. The most common type of folder for medical charts is the third-cut folder. Tabs are one-third the width of the folder and appear at the left side, center, or right side.

Labels Labels are often used on the folder tabs to identify the individual folder's contents. You can write directly on the tab area, but it is critical that each label be printed very clearly, so it is more desirable to print the chart label. This method is consistently easier to read and lends a more professional appearance. Printed labels can easily be created using a label template available with most word processing software programs, like Microsoft Word.

No matter what filing system your office uses, it is important to be consistent in preparing file labels. If all the files are labeled with the patient's last name, followed by the patient's first name and middle initial (for example, Brown, Emma L.), each label must then follow this format. It is important that the patients' names are always spelled correctly, whether on the chart label or within the record itself.

FIGURE 13-3 Medical offices use a wide assortment of filing supplies. Courtesy Bibbero Systems, Inc.

Hanging File Folders

In order to keep individual medical records neatly organized within a file cabinet, they are most often placed in hanging file folders in the cabinet drawer. Hanging file folders resemble regular folders but have hooks on the sides that allow the folder to hang from the metal bars placed along the sides of the drawer.

Plastic tabs inserted on top of the hanging filed folders contain label inserts that clearly list the contents of the folder. As with all labeling, these inserts should be prepared in a consistent, legible manner.

Binders

Some offices keep patient records in three-ring binders rather than in file folders. The binders are labeled on the outside spine. Documents are three-hole-punched and then placed inside the binder. Binders are stronger than a file folder but require more storage space and so may not be functional for most medical offices. Inactive patient records can be transferred to a file folder for off-site storage. The binder can then be used again. Binders are especially effective for practices that see patients repeatedly, resulting in very large medical records.

File Guides

To identify a group of file folders in a file drawer, you may use **file guides**, which are heavy cardboard or plastic inserts to separate the contents so individual files can be found easily. For example, if a drawer contains the files for patients whose last names begin with the letters A through C, the guides might separate A from B and B from C.

Out Guides

Another filing supply is an **out guide**. An out guide is a marker made of stiff material. It is used as a placeholder when a file has been removed from the filing system. Many out guides include a clear pocket that can hold the name of the file that belongs in that place or the name of the individual who took the file, and its return due date. Other out guides contain a lined sheet of paper where you can write who has the chart and the date it was taken on the out guide, and then cross it out when the file is returned. Out guides can be used for both shelf and cabinet filing.

Although out guides are not essential, they are extremely helpful in ensuring that files are returned to their proper places. Out guides also save time, as they make it obvious when a file is missing and where it is to be returned. Out guides work best when the entire staff, including the practitioners, makes a dedicated effort to use the system.

File Sorters

File sorters are large, accordion-style folders with tabs in which records can be stored temporarily, until the patient records can be returned to their proper placement in the cabinet or shelf. Other file sorters may also sit on a desk and have multiple slots for temporary placement of patient records.

► Filing Systems

LO 13.4

A filing system is the method by which files are organized. A variety of filing systems may be used, but every system places

patient records in some sort of **sequential order**—one after another in a pattern, or sequence, that can be predicted. Always follow the office filing system exactly, as any deviation can result in lost or misplaced records. Never make any changes in the filing system without first consulting all members of the practice.

Alphabetic Filing System

One of the most common and easiest filing systems for maintaining patient files in sequential order is the **alphabetic filing system**. In the alphabetic filing system, files are arranged in alphabetic order. Each patient's medical record is labeled with

the patient's last name, followed by the first name and the middle initial (if any). Let's look at this example, consisting of four patient names, filed alphabetically:

Williams, Louis R.
Wilson, Michelle A.
Wilson, T. Andrew.
Wilson, Thomas A.

The specific rules to follow when filing personal names alphabetically are called **indexing rules** (Table 13-1). These rules

TABLE 13-1 Indexing Rules for Alphabetic Filing of Personal Names

In alphabetizing, treat each part of a patient's name as a separate unit and look at the units in this order: last name, first name, middle initial, and any subsequent names or initials last. Disregard punctuation. Follow the “nothing before something” rule—an initial will come before a full name spelled out.

Name	Unit 1	Unit 2	Unit 3	Unit 4
Stephen Jacobson	Jacobson	Stephen		
Stephen Brent Jacobson	Jacobson	Stephen	Brent	
B. T. Jacoby	Jacoby	B	T	
C. Bruce Hay Jacoby	Jacoby	C	Bruce	Hay
D. Jones	Jones	D		
David Jones	Jones	David		
Kwong Kow Ng*	Ng	Kwong	Kow	
Philip K. Ng	Ng	Philip	K	

Treat a prefix, such as the “O” in O'Hara, as part of the name, not as a separate unit. Ignore variations in spacing, punctuation, and capitalization. Treat prefixes—such as De La, Mac, Saint, and St.—exactly as they are spelled.

Name	Unit 1	Unit 2	Unit 3	Unit 4
A. Serafino Delacruz	Delacruz	A	Serafino	
Victor P. De La Cruz	DeLaCruz	Victor	P	
Irene J. MacKay	MacKay	Irene	J	
Walter G. Mac Kay	MacKay	Walter	G	
Kyle N. Saint Clair	SaintClair	Kyle	N	
Peter St. Clair	StClair	Peter		

Treat hyphenated names as a single unit. Disregard the hyphen.

Name	Unit 1	Unit 2	Unit 3	Unit 4
Victor Puentes-Ruiz	PuentesRuiz	Victor		
Jean-Marie Vigneau	Vigneau	JeanMarie		

A title, such as Dr. or Major, or a seniority term, such as Jr. or 3d, should be treated as the last filing unit to distinguish names that are otherwise identical.

Name	Unit 1	Unit 2	Unit 3	Unit 4
Dr. George B. Diaz	Diaz	George	B	Dr
Major George B. Diaz	Diaz	George	B	Major
George B. Diaz, MD	Diaz	George	B	MD
James R Foster Jr.	Foster	James	R	Jr
James R Foster Sr.	Foster	James	R	Sr
Sister Theresa**	Sister	Theresa		

*In the case of foreign or Asian names, when unsure of first- and last-name order, many offices cross-reference the file with a “dummy record” at the alternate location stating “see Ng, Kwong Kow.”

**“Sister Theresa” and similar names, where there is no clear first or last name, are “filed as written.”

Source: Adapted from William A. Sabin, *The Gregg Reference Manual, 11th ed.* (Columbus, OH: Glencoe/McGraw-Hill, 2011).

are used as guidelines for the sequencing of files based on current business practice. They define a consistent method for the ordering of filed materials. The Association of Records, Managers, and Administrators monitors and updates these suggested methods periodically. In this way, the best, most efficient management of paper records is continually being reevaluated. From time to time, individual medical practices may choose to deviate from some of these accepted practices. However, indexing rules are the norm for most medical practice filing systems.

Indexing rules define each part of a person's name or title as a **unit**. The rules then describe the order to display and manage each unit in an alphabetized system. These rules are designed to keep alphabetizing simple and consistent, but you must know the exact spelling of a patient's name to retrieve a file. You also must know the rules of indexing. Check out the *Points on Practice* feature for common indexing rules and examples of correct filing order when indexing names that are very similar.

Chronological Filing

A chronological filing system is based on dates. Chronological filing is a type of numeric arrangement that uses numeric dates as the indexing units. The most common order of units is year, month, and day, as in 16-11-06 to denote the sixth of November 2016. It is also common practice to order the most current dates first, with the files that follow in decreasing date order.

In a medical practice, filing chronologically is one method used to file documents *within* a patient's chart. The most recent files (by date) are inserted so they are on top of documents with earlier dates in the file folder. This is known as **reverse chronological order**.

Numeric Filing

A **numeric filing system** organizes files by numbers instead of by names. In this system, each patient name is assigned a number. New patients are assigned the next unused number in sequence. Then, instead of being filed by name, the files are arranged in numeric order—1, 2, 3, 4, and so on. The resulting files are sequential by the order in which patients have come to the practice.

Only the numbers are indicated on the files. Numeric filing systems were formerly used only when patient information was considered highly confidential, but now that all patient information is considered PHI, it is found in many practices. Larger practices also find alphabetic filing more cumbersome than numeric filing, which can be expanded more easily than an alphabetic filing system.

A numeric system must include a master list of patient names and their corresponding medical record numbers (MRN). Numeric systems are known as **indirect filing systems**. If the office is not computerized, to ensure confidentiality, the office manager should keep the master list in a secure place. The provider should hold a duplicate copy, which must also be kept under lock and key. To find a patient's file number using a computer system, click the "Open Patient

Chart" button and enter the first few letters of the patient's last name. Then scroll through the names and find the required patient (Figure 13-4). Choose that patient (usually by highlighting the patient name) and press the "Enter" key. The computer then provides the medical record number for that patient.

Terminal digit filing is often the filing system of choice for numeric filing systems. This type of filing allows for the storage of an endless number of files with only a minimal amount of searching needed to obtain the correct files. Numbers are assigned in small groups of two or three numbers, similar to a Social Security number. Each group of numbers is then read from right to left, starting with the last unit as the primary index. Filing is done numerically, starting with the lowest number and moving to the highest. For example, all files ending in 000 are filed first. They are then followed by files ending in 001 and so on. See Table 13-2 for an example.

Middle digit filing is similar to terminal digit filing but instead uses the middle group of numbers as the primary index, followed by the left-hand number and then the right-hand one. See Table 13-3 to view the same medical record numbers filed using the middle digit system.

Numeric, terminal digit, and middle digit filing can all be used in combination with color-coding to add even more information to the filing system.

Color-Coding

Color-coding is used when there is a need to distinguish files within a filing system. For example, you may wish to find at a glance all the new patients in the office, all patients on Medicare, or all patients whose last names begin with the letters *W*. Coding by color can help you do so quickly and easily. Color-coding may be done in a variety of ways using colored file folders, colored labels, plastic tabs, and/or stickers.

Using Classifications To make the best use of color, you must first identify the classifications that are important to your office. For example, it may be important to identify all new patients easily, or those on Medicare. Once a classification is selected, the decision must be made as to what method of coding will be used (folder, labels, or stickers). Then, a different color must be chosen to denote each classification. For example, all new patients may be kept in red folders, or plain manila folders may be used with a red sticker or red filing label attached to the charts of new patients.

An office that uses colored charts to denote specific patient demographics might look something like this: Patients under the age of 18 have blue charts; patients over the age of 65 have red charts; and patients with diabetes have green charts, with a pink sticker added for those who are on insulin. In an emergency situation, such as when a patient with diabetes passes out while in the office, the color-coding could give staff quick and vital information at a glance.

After a color-coding system is finalized, the codes should be prominently posted on a chart in the file room so that all staff members are aware of them. This chart will help to ensure that records are filed correctly. Remember, update

*Showing each filing unit.

color-coded files consistently, coding new ones and revising older ones as a patient’s status changes.

Using Color in an Alphabetic Filing System

Another way to use color-coding is in conjunction with alphabetic filing systems. After files are organized alphabetically, each letter of the alphabet is assigned a color. Then the first two (or three) letters of each patient’s last name are color-coded, usually with colored stickers.

The colored tabs are attached to the top of straight-edged or tabbed file folders. For example, if the letter *S* is coded as light blue and the letter *M* is coded as light green, all names starting with *SM*—like Smith—would have light blue and light green

stickers on the tabs of their medical charts. The name Snyder would be filed under a different color combination, such as light blue (for *S*) and peach (for *N*). See Figure 13-5. Because the colors will be the same in each segment of the file drawer, a color-coded system makes it easy to tell at a glance if files are filed correctly (refer back to Figure 13-1).

Using Color in a Numeric Filing System

Color can be used in a similar way with numeric systems. The numerals 1 to 9 may each be assigned a distinct color. As with the alphabetic system, color-coding helps identify numeric files that are out of place. When using color with numeric filing systems, most offices color the primary index or “key unit”

POINTS ON PRACTICE

Indexing Rules

Rule 1: Individual Names

The last name is the first indexing unit, the first name is the second unit, and the middle name is the third unit. If an initial is used instead of a name, the single initial is viewed as the entire unit.

Name	Unit 1	Unit 2	Unit 3	Unit 4
D. Jones	Jones	D		
David Jones	Jones	David		
David R. James Jones	Jones	David	R	James

Rule 2: Business Names

As written (on letterhead) each word is a unit. If “The” is used as the first word, it is considered the last unit.

Name	Unit 1	Unit 2	Unit 3	Unit 4
Jones Hearing Supplies	Jones	Hearing	Supplies	
The Jones Hearing Supplies	Jones	Hearing	Supplies	The

Rule 3: Hyphenations and Abbreviations

All hyphenated names are considered to be one unit (that is, Terry-Jones, Sheila); an abbreviated name is combined to form the unit. An abbreviated name, such as Wm. for William, is filed as Wm, without the use of a period.

Name	Unit 1	Unit 2	Unit 3	Unit 4
St. Mary, William	StMary	William		
St. Mary, Wm.	StMary	Wm		
Terry-Jones, Sheila	TerryJones	Sheila		

Rule 4: Titles and Seniority Terms

Titles are normally disregarded unless they are used to distinguish between two patients with the same name. If there are patients with the same name and a title precedes the name, use it as the fourth unit. Seniority terms such as Jr. or Sr. may be indexed as the last unit. It is important to remember that if a male child has exactly the same name as his father, he is considered Jr. until his father dies. He is a III if his father and his grandfather have the same name. If II or III is used as a seniority title, the basic rule states that numbers come before letters, so David Jones III would be filed before David Jones Jr.

Name	Unit 1	Unit 2	Unit 3	Unit 4
David C. Jones	Jones	David	C	
Rev. David C. Jones	Jones	David	C	Rev
David Jones Jr.	Jones	David	Jr	
David Jones Sr.	Jones	David	Sr	

Rule 5: Prefixes

If the last name has a prefix such as Mc, Van, or de, the prefix is part of the last name. It starts the first indexing unit. The prefixes Mc and Mac are usually filed in alphabetical order as part of the last name.

Name	Unit 1	Unit 2	Unit 3	Unit 4
Elias DeLongino	DeLongino	Elias		
Drew MacDreamy	MacDreamy	Drew		
Drew McDreamy	McDreamy	Drew		
Elias D. Van Collins	VanCollins	Elias	D	

Rule 6: Names of Married Women

A woman may retain her maiden name as her last name instead of taking her husband’s surname; she also may use both names and hyphenate them (see Rule 3: Hyphenations and Abbreviations). She will always keep her first and middle name as part of her original name. A married woman’s name may take several forms.

Name	Unit 1	Unit 2	Unit 3	Unit 4
Mrs. David (Cynthia M.) Jones	Jones	Cynthia	M	
Mrs. Gisele Marie Jones	Jones	Gisele	Marie	
Mrs. Gisele M. Monagan-Jones	MonaganJones	Gisele	M	

Rule 7: Identical Names

If two names are identical, make sure you index them first under their names; location is next (city as the first unit, state as the second unit, street is the third unit, and street number listed lowest to highest is the fourth and final unit). This rule is used for businesses and individuals.

for each chart. If the key unit is three numbers, then all three numbers of the key unit will use a colored tab to identify each file. For example, recall our medical record numbers from Table 13-2 for terminal digit filing (see Example (a)). If #5 is blue, #6 is red, and #7 is yellow, our chart tabs for filing would look as shown in Example (b).

002-25-565
001-25-566
001-24-667
002-24-667

Example (a)

5	6	5
5	6	6
6	6	7
6	6	7

Example (b)

© McGraw-Hill Education

Procedure 13-1, at the end of this chapter, explains how to use your knowledge of alphabetic and numeric filing and color-coding to set up a patient records system.

Supplemental Files

Occasionally, you may need to set up additional files to supplement the medical records filing system. For example, you may wish to keep some information separate from the primary file, such as older patient records or the required separate filing system for patient financial and insurance information. In these cases, you set up supplemental files, which allow you to keep this additional information about each patient without cluttering up the primary filing cabinets or making it difficult to find information.

Supplemental files are usually created using the same system as the primary files, but they are kept in a different location. Depending on frequency of use, they may be stored in a less accessible, but equally secure, area of the office. If you are keeping supplemental files, it is important to distinguish their content from that of the primary files. For example, all medical information—like patient diagnosis and treatment—will be kept in the primary files, but the financial, insurance, and billing information for each patient will be kept in a separate billing filing system. This designation will help you and other office staff members know exactly where to go to retrieve specific information.

Tickler Files

To avoid losing track of important dates, many medical practices use tickler files. A **tickler file** is a date-ordered reminder file. Think of your smartphone or home calendar; many of us record important activities and reminders, creating an informal tickler file for our personal activities. Any office activity that needs to be scheduled ahead of time can be noted and a reminder placed in the file. For example, reminders to order supplies or send patient checkup cards can be entered. When the task has been completed, the note can be crossed off the list or removed from the file and thrown away. In computerized offices, many office software packages include calendars and “tickler files” with pop-up reminders of meetings and other activities. Regardless of how it is set up, the person

involved with the activity should regularly check the tickler files at a minimum of once a week—preferably daily. This is important because tickler files only work if they are used regularly.

You can organize tickler files in a variety of ways. The common manual method, discussed in Procedure 13-2 at the end of this chapter, is to allot one file folder to each month of the year or to use a three-ring binder separated with tabs for each month. Tickler files also can be organized by day of the week or week of the month. This method is most useful if there are responsibilities that occur regularly on a certain day of the week or in a certain week within the month. If you find there are so many notes in a monthly folder that it becomes cumbersome, organizing files by the week should make this easier.

Computerized tickler files are usually in the form of a calendar. When the computer is turned on, it lists, for example, “Things to Do Today,” with the tickler information posted for that date. Reminders can be set for tasks that must be completed on a regular basis—daily, weekly, or monthly—on a one-time basis.

► The Filing Process

LO 13.5

Pulling and filing patient records and filing individual documents may be among your responsibilities as a medical assistant. Some practices require that records be returned to the files as soon as they are no longer in use. Other practices schedule a specific time at the end of each day to file the current day’s records and pull those for the next day.

Records waiting to be filed should be placed temporarily in a file return area. To protect patient privacy, this place should be in a secure area of the office. Clear rules should designate who may handle these files and under what conditions.

The Steps in Filing

Essentially, you will be filing three types of items: new patient records, individual documents that belong in existing patient records, and patient records that are being returned to the filing system. There are five steps involved in filing: inspecting and releasing, indexing, coding, sorting, and storing.

Inspecting and Releasing **Inspecting**, sometimes called **conditioning**, is the process of making sure the item is ready for filing. Remove paper clips or other fasteners, stapling related documents together. If a document is smaller than standard size, it may be attached to a standard sheet of paper with paper or rubber cement. “Shingling” (layering) similar small documents may also be permitted to save space. If smaller documents have wording on both sides of the paper, they may also be placed in a plastic sheet protector and then filed.

Depending on office policy, either just before or immediately after conditioning, the document should be released for filing. **Releasing** usually consists of a mark or stamp on the item that indicates that the responsible licensed practitioner has seen the document and is giving permission to file it in the patient’s medical record.

Indexing Another term for naming a file is **indexing**. Names should be chosen carefully, as that is how the file will be known, retrieved, and replaced. Traditionally, patient names have been used as the file names for patient records, but today this is often replaced with a numeric name or index. Most offices that use a numeric system use computer software to create new patient medical record numbers. Part of the indexing process will be to verify that the color-coding (if used) is correct and that any stickers or labels are securely fastened to the file. If colored files are used to denote patient diagnosis or insurance type, indexing is also the time to verify if any changes need to be made to the patient's file related to his or her current demographic.

Note that some files can logically be placed in more than one location. Such files should be **cross-referenced**, or filed in two or more places, with each place noted in each file. When cross-referencing a file, you may create a cross-reference form that gives the correct location to look for the file. For instance, an elderly woman might refer to herself as Mrs. John Smith. If you cannot remember her legal name, in the area where *Smith, John, Mrs.* would be located, you would place a mock folder that reads “Smith, John, Mrs., SEE Smith, Christine.” You would then place the form under any heading where it is possible to look for that file. You may wish to attach it to a blank file folder, cutting the file folder in half so it consists of only one sheet, so that no documents are mistakenly filed within it.

Coding When you put an identifying mark or phrase on a document to ensure that it is placed in the correct file, that is known as **coding**. To code a document, simply write the patient's name, MRN, or the subject title of the file folder on the document. Alternatively, you can underline or highlight key words on the document itself. This step can be skipped when returning patient documents to their medical record or returning the records themselves to their properly filed location.

Sorting If you have more than one document or medical record to be filed, you must sort the files (documents) that have accumulated. Sort them in the order in which they are kept—such as alphabetically or numerically. Sorting saves you time later when you return the files to their proper places. If you will not be filing the items immediately, store them in a temporary location, like a file sorter.

Storing The final step in the filing process is to store the files in the appropriate filing equipment. Documents should be stored neatly within their file folders in the proper sequence.

Careful attention to file storage will make your job easier. Make sure the charts (folders) are in good condition. Replace them whenever they appear damaged or torn to prevent file contents from spilling out during the retrieval and filing process. If a file contains too many documents and becomes too bulky, divide it into two or more folders and label each one (for example, Glass, Ann M.—Folder 1 of 2; Glass, Ann M.—Folder 2 of 2). Also, be sure when labeling records that

consist of more than one chart that the content of each chart is clear (Folder 1 of 2, records prior to 2011; Folder 2 of 2, records from 2011 forward). Replace any labels that are no longer legible.

Filing Guidelines

There are specific rules for each filing system, as well as general guidelines that are applicable to any system. Following these guidelines will help you file more efficiently (Figure 13-6).

- Each time you pull or file a patient record, glance at its contents. You should be familiar with the typical contents and the order of a patient record folder to help avoid filing errors.
- Keep files neat. Make sure that documents fit neatly into the file folders. Papers should not extend beyond the edge of the folder. Do not place too many papers in each file folder. Folders should stay closed when laid on a flat surface.
- When inserting documents into folders already in place in the drawer, lift the folders up and out of the drawer; otherwise, this can lead to misfiling of documents. Attempting to force documents into a folder inside the drawer can damage the documents.
- Do not crowd the file drawer. Leave extra space to allow for leafing through the files and for retrieving and replacing

FIGURE 13-6 Filing on a regular basis keeps the task from becoming overwhelming and reduces the incidence of lost files.

© Exactstock/SuperStock RF

files easily. Where possible, use a combination of uppercase and lowercase letters to label folders. This format is easier to read than labels written completely in capital letters.

- Choose file guides with a different tab position than your folders to help them stand out. Do not place guides so close together that they hide one another. A good rule of thumb is to position guides at least 5 inches apart.
- If you are unsure whether to cross-reference a file, do it. It is better to err on the side of providing too many cross-references than too few.
- File regularly so that you are not overwhelmed with too many records or documents.
- Store only files in filing cabinets or on filing shelves.
- Do not store office equipment or supplies where files belong.
- Train all staff members who will retrieve and replace files to make sure they have a thorough understanding of the system. Update them on any changes.
- Periodically evaluate your office's filing system.

Locating Misplaced Files

Even in the best filing systems, there is a chance of temporarily misplacing or even losing a paper medical record. No matter how good a system is, errors will still be made. If a file is misplaced, here are steps you can take to try to locate it.

1. Determine the last time you or anyone else in the practice knew the file's location.
2. Go to that location and retrace the steps of the last person who handled the file. Look for the file along the way.
3. Look in the filing cabinet where the file belongs. Check neighboring files. Possibly, the file was simply put in the wrong place. Look inside other, thicker files to determine if the missing file was accidentally placed inside another file.
4. Check underneath the files in the drawer or shelf to see if the file slipped out.
5. Check the pile of items to be filed or the file sorter envelope.
6. Consider possible cross-references or similar indexes (for example, similar patient names) for the file. Check those headings to see if the file was accidentally placed there.
7. Check with other staff members to determine if they have seen the file.
8. Check to make sure the missing file was not filed under the patient's *first* name instead of the last.
9. Stand back from the file cabinet and view the *top* of the folders, looking at only the first three letters of the last names. A misfiled file will stand out.
10. If using a color-coded system, look for the color of the misfiled chart.
11. Even though files should always be kept in a secure area, occasionally individuals who are not part of the office staff, such as visiting providers may be in the area and may inadvertently pick up a file with their own materials.

If you think someone could have taken the file, call the person immediately.

12. Ask another staff person to complete steps 1 through 7 to double-check your search.
13. Straighten the office, taking care to check through all piles of information where a file could be lodged.
14. Check those charts that have been pulled for next day's appointments to see if misplaced charts have been accidentally pulled.
15. Check the provider's desk (and office).

If the misplaced file is not found within a reasonable time—24 to 48 hours—it may be considered lost. Losing a file has potentially devastating consequences, as it contains the patient's medical history, test results, and treatments. It may not be possible to duplicate the information within the file, but you can try to re-create it in a new medical record.

To do this, meet with the provider and clinical staff members to review the information needed. Record their recollections of information in the file. Note on the medical record that it is a duplicate and that the information is not official.

Consult with other offices and departments that may have records related to the file. Contact laboratories, hospitals, and other providers to request copies of documents previously included in the lost file. Place copies of those records in the new medical record, or excerpt information given to you. If the provider considers it appropriate, tell the patient whose file has been misplaced about its status and the steps you have taken to re-create it, including the offices and facilities that have been contacted to obtain information needed to re-create the medical record.

Limiting Medical Record Access

As stated earlier, the information in a patient's medical record is on a "business need to know." In computerized offices, your access ID and password will restrict the information you are allowed to see. Some offices using paper records restrict the number of people who can retrieve and return files, adding an extra measure of security to the practice. To obtain a file, staff members must fill out a requisition slip with their name, the name of the patient, and the reason for the request.

A record of who has the file is kept either in a notebook or on index cards in a card file. It also may be placed on the out guide, which is kept in the same location as the record until the record itself is returned to the filing system.

Unless required by court order, original patient medical records should not leave the practice. Photocopies can be made, if necessary. Review the *Legal and Ethical Issues* chapter regarding release of patient information.

▶ Active, Inactive, and Closed Files LO 13.6

No office has unlimited space for storage of paper records, so you need to understand the differences between active, inactive, and closed files. In your role as medical assistant, you may regularly need to transfer inactive and closed files from the office filing area to a storage area.

Active Versus Inactive Files

At any given time, there are files that you use frequently, called **active files**, and files that you use infrequently or not at all, called **inactive files**. What constitutes an active, as opposed to an inactive, file? It depends on your individual practice. In a cardiologist's office, a patient who has not been seen for a year may be considered inactive, while in a dental office, a year may simply indicate one missed appointment.

A third category of files, called **closed files**, are files of patients who have died, have moved away, or for some other reason no longer come to the office. Although closed files could be moved immediately to storage, they are usually treated in the same manner as inactive files. That is, they are kept in the office for a certain length of time to make sure that there are no requests for the information in the file.

The length of time inactive and closed files are kept or retained is 7 to 10 years. All medical records must be retained for 7 years; however, because the Federal False Claims Act requires financial records be kept for 10 years and medical records provide the medical necessity information for the billing records, many legal experts suggest also keeping medical records for 10 years (see the *Legal and Ethical Issues* chapter). Ultimately, it is the licensed practitioner who will determine when a patient file is deemed inactive or closed. You and the practitioner (or office manager) can meet regularly (once a month or once a quarter) to review these files.

Records Retention

A **retention schedule** specifies how long to keep different types of patient records in the office after files have become inactive or closed. The schedule also details when files should be moved to a storage area and how long they should be kept in storage before being destroyed. The retention schedule should be posted in the file room to make certain that all staff members are aware of it. Always be extremely careful not to destroy records prematurely, because they often cannot be re-created. Always retain a list of documents or files that have been destroyed for future reference.

For assistance in creating a retention schedule, consult the most updated and complete list of required record retention periods according to HIPAA law, which can be found on the HIPAA advisory website (<http://www.hhs.gov/ocr/hipaa>). Additionally, state and local retention requirements can be obtained from insurance companies, state and local agencies, and medical associations. If you do business in more than one state, follow the schedule that requires the longest retention time for materials. Remember, if your state's (retention or other) requirements are more stringent than HIPAA laws, follow your state requirements.

When counting years in a retention schedule, do not count the year in which the document was produced but begin counting with the following year. This way, documents produced near the end of a calendar year will be tracked more efficiently. Procedure 13-3 summarizes the steps for setting up a records retention program.

When records are to be eliminated, they can never simply be thrown away because of the confidential information

contained within them. All medical records, as well as any document containing confidential information, must be completely destroyed by shredding.

Basic Storage Options

Before you can transfer files to storage, you need to determine how and where they will be stored. The design and layout of file storage should make even older stored files easily accessible so that they can be evaluated periodically for retention or elimination.

There are many ways to store inactive files. For example, they can be stored in their original paper state or transferred into another format, such as onto a computer disk. Files can even be electronically coded with bar codes for immediate retrieval with a computer system. Regardless of the medium chosen for storing and preserving documents, keeping related material together and retrieving it should be made as easy as possible. Inactive files contain PHI and must be kept just as secure as active files.

Paper Storage If the practice chooses to store files in their original form, they will likely be stored in boxes labeled with their contents. Choose boxes that are uniform in size so they will stack well and have lift-off lids for easy access to contents.

Although paper files are bulky to store and require roughly the same amount of space as they occupied while in the office, these files preserve the original documents. Access to these documents can be important when providing evidence of medical treatment in legal proceedings. However, if paper files start to become brittle, they should be transferred to another storage medium.

Computer Storage If storage space is limited, there are a number of paperless options for storing files, which include recordable CDs or DVDs, jump or flash drives, and external hard drives. To store records or information electronically, the office needs a computer system that can transfer documents to some type of electronic or digital format and then read them when they are retrieved from storage. (Refer to the *Office Equipment and Supplies* and the *Electronic Health Records* chapters for electronic storage options.)

The easiest way to transfer documents directly into the computer is to use a scanner, which copies a document to the computer's hard drive. This process saves countless hours of rekeying documents into the computer. Most scanners can also copy graphics and handwritten notes. The document is then labeled and saved. Documents that were originally created using the computer can also be transferred to CD, DVD, or external hard drive and then deleted from the computer system's internal hard drive. The chosen storage device is then dated and stored in labeled file boxes or other containers. The *Electronic Health Records* chapter provides more detailed information about electronic document creation and storage options.

Storage Facilities

You may wish to store files in a remote area of your office building, like an unused closet or office. Check to make sure that the area is secure, accessible, and safe for storing files

(for example, do not store files where hazardous materials are stored). The practice may have to pay additional rent if the space is not within the confines of its office suite.

If there is no space in the building, consider a neighboring building, perhaps one in the same office complex. Many buildings rent space that can be used to store records. If you pursue this option, you will be responsible for managing the storage of records, including transporting them to the space, positioning them, and retrieving them as needed.

Certain storage facilities, called commercial records centers, will do some of the work for you. For a monthly fee, these centers typically house and manage stored documents. When evaluating commercial records centers, inquire about whether they will retrieve and/or deliver boxes or files and whether there is an on-site work area if someone needs to review the files at the storage location.

Maintain a separate list of files stored off-site. This list can save a wasted trip to the storage site if a needed file is not housed there. The list also provides a valuable record if files are damaged or destroyed. Remember, always update the list as new files are moved into storage and old files are taken out of storage and destroyed.

Storage Safety

No matter where you store files, you must consider the issue of safety as well as security. Beware of general storage facilities that are not specially equipped for document management. For example, these facilities may not address safety concerns by taking precautions for fire or floods—an absolute necessity for medical records. So it is wise to evaluate the storage site and to take some basic precautions.

- Choose a site with moderate temperatures year-round and adequate ventilation.
- Select waterproof storage containers that can also withstand intense heat. When possible, use metal or plastic boxes that are designated as fireproof and waterproof. Cardboard boxes, although often used for storage, are not as strong or durable. If cardboard storage boxes are used, they need to be placed on shelving well off the floor to avoid water damage.
- Choose a site equipped with a smoke alarm, a sprinkler system, and fire extinguishers.
- Select a site that is above ground and away from flood hazards. One way to find out if a site is susceptible to flooding is to inquire whether the facility has flood insurance, a requirement for sites at risk.
- Choose a site that is kept locked, is regularly patrolled, or has an alarm system, to prevent theft or vandalism.
- Remove old, brittle files as soon as possible or transfer them into another format. They can then be placed in file storage again.
- Ask for references from people at other offices who have stored files at the site. Talk to these people about what they like and dislike about the storage facility and any problems they have had in storing or retrieving documents.
- If you are storing files in another form—on computer disk or microfiche—inquire about any special precautions the site owner takes to ensure safety.

Taking the time to thoroughly research storage options ultimately saves time and effort as you manage stored files.

PROCEDURE 13-1 Creating a Filing System for Paper Medical Records

Procedure Goal: To create a filing system that keeps related materials together in a logical order and enables office staff to store and retrieve medical records efficiently

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Vertical or horizontal filing cabinets with locks, tabbed file folders, labels, file guides, out guides, filing sorters

Method:

1. Evaluate which filing system is best for your office—alphabetic or numeric. Make sure the provider approves the system you choose.
RATIONALE: *The purpose of a filing system is to provide accessibility of all medical records for the entire staff.*
2. Establish a style for labeling files and make sure that all file labels are prepared in this manner.
3. Avoid writing labels by hand. Use a keyboard, a label maker, or preprinted adhesive labels.
4. Set up a color-coding system to distinguish the files (for example, use blue for the letter *A*, red for *B*, yellow for

C, and so on). Create a chart, suitable to be hung in a professional file room, that uses the color-coding system.

5. Use file guides to divide files into sections.
6. Use out guides as placeholders to indicate which files have been taken out of the system. Include a charge-out form to be signed and dated by the person who is taking the file.
RATIONALE: *Out guides allow for quick and easy identification of a missing file and its location.*
7. To keep files in order and to prevent them from being misplaced, use a file sorter to hold those patient records that will be returned to the files during the day or at the end of the day.
8. Develop a manual that explains the filing system to new staff members. Include guidelines on how to keep the system in good order.
RATIONALE: *A filing system only works when all office personnel use it consistently.*

PROCEDURE 13-2 Setting Up an Office Tickler File

Procedure Goal: To create a comprehensive office tickler file designed for year-round use

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: 12 manila file folders or 3-ring binder with 12 separators, 12 file labels, pen or typewriter, paper

Method:

1. Write or type 12 file labels, 1 for each month of the year. Abbreviations are acceptable. Do *not* include the current calendar year, just the month.
2. Affix one label to the tab of each file folder.
3. Arrange the folders so that the current month is on the top of the pile. Months should follow in chronological order.
4. Write or type a list of upcoming responsibilities and activities. Next to each activity, indicate the date by which the activity should be completed. Leave a column after this date to indicate when the activity has been completed. Use a separate sheet of paper for each month.
RATIONALE: *Each sheet should clearly indicate when the activity has been completed and by whom. Each sheet should be filed within the appropriate month's folder.*
5. File the notes by month in the appropriate folders.

RATIONALE: *This will create a neat and orderly way to collect tickler notes for each month.*

6. Place the folders in order, with the current month on top, in a prominent place in the office, such as in a plastic box mounted on the wall near the receptionist's desk.
7. Check the tickler file at least once a week on a specific day, like every Monday. Assign a backup person to check it in case you happen to be out of the office.
8. Complete the tickler activities on the designated days, if possible. Keep notes concerning activities in progress. Be sure to note when activities are completed and by whom.
RATIONALE: *Keep a record of responsibilities and completed activities in case a question concerning the activity or responsibility comes up at a later date.*
9. At the end of the month, place that month's file folder at the bottom of the tickler file. If notes are remaining in that month's folder, move them to the current month's folder.
RATIONALE: *Incomplete activities must be moved to the new month to be sure they are not overlooked.*
10. Continue to add new notes to the appropriate tickler files.
RATIONALE: *To provide for continual update to the tickler system.*

PROCEDURE 13-3 Developing a Records Retention Program

Procedure Goal: To establish a records retention program for patient medical records that meets office needs, as well as legal and government guidelines

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Updated guide for record retention as described by federal and state law (go to the HIPAA advisory website), file folders, index cards, index box, paper, pen or typewriter

Method:

1. List the types of information contained in a typical patient medical record in your office. For example, a file for an adult patient may include the patient's case history, records of hospital stays, and insurance information.
2. Research the state and federal requirements for keeping documents. Contact your appropriate state office (such as the office of the insurance commissioner) for specific state requirements, like rules for keeping records of insurance payments and the statute of limitations for initiating lawsuits. If your office does business in more than one state, be sure to research all applicable regulations. Consult with the attorney who represents your practice.

3. Compile your research results in a chart. At the top of the chart, list the different kinds of information your office keeps in patient records. Down the left side of the chart, list the headings "Federal," "State," and "Other." Then, in each box, record the corresponding information.
4. Compare all the legal and government requirements. Indicate which one is for the longest period of time.
RATIONALE: *Retaining all records for the longest period of time required by the laws governing your organization will assure that you are in compliance with all laws.*
5. Meet with the provider (or office manager) to review the information. Working together, prepare a retention schedule. Determine how long different types of patient records should be kept in the office after a patient leaves the practice and how long records should be kept in storage. Although retention periods can vary based on the type of information kept in a file, it is often easiest to choose a retention period that covers all records. Determine how files will be destroyed when they have exceeded the retention requirements. Usually, records are destroyed by paper shredding. Purchase the appropriate equipment, or contract with a shredding company as necessary.

RATIONALE: *Shredding complies with HIPAA privacy rules regarding protected health information (PHI).*

6. Put the retention schedule in writing and post it prominently near the files. In addition, keep a copy of the schedule in a safe place in the office. Review it with the office staff.
7. Develop a system for easily identifying files under the retention system. For example, for each file deemed inactive or closed, prepare an index card or create a master list containing the following information:
 - Patient name and Social Security number
 - Contents of the file
 - Date the file was deemed inactive or closed and by whom
 - Date the file should be sent to inactive or closed file storage (the actual date will be filled in later; if more than one storage location is used, indicate the exact location to which the file was sent)
 - Date the file should be destroyed (the actual date will be filled in later)

Have the card signed by the provider (or office manager) and by the person responsible for the files. Keep the card in an index box or another safe place. This is your authorization to destroy the file at the appropriate time.
8. Use color-coding to help identify inactive and closed files. For example, all records that become inactive in 2018 could be placed in green file folders or have a green sticker with “18” placed on them and moved to

a supplemental file. Then, in January 2018, all of these files could be pulled and sent to storage.

9. One person should be responsible for checking the index cards once a month to determine which stored files should be destroyed. Before retrieving these files from storage, circulate a notice to the office staff stating which records will be destroyed. Indicate that the staff must let you know by a specific date if any of the files should be saved. You may want to keep a separate file with these notices.
10. After the deadline has passed, retrieve the files from storage. Review each file before it is destroyed. Make sure the staff members who will destroy the files are trained to use the equipment properly. Develop a sheet of instructions for destroying files. Post it prominently with the retention schedule, near the machinery used to destroy the files.

RATIONALE: *To guard patient confidentiality and follow all HIPAA laws governing the protection of patient information.*
11. Update the index card, giving the date the file was destroyed and by whom.
12. Periodically review the retention schedule. Update it with the most current legal and governmental requirements. With the staff, evaluate whether the current schedule is meeting the needs of your office or whether files are being kept too long or destroyed prematurely. With the provider’s approval, change the schedule as necessary.

S U M M A R Y O F L E A R N I N G O U T C O M E S	
LEARNING OUTCOMES	KEY POINTS
13.1 Identify the common equipment used to file and store paper medical records.	Filing shelves, filing cabinets (horizontal and vertical), compactable files, and rotary files are all commonly used to store paper medical records. A very small office might opt to use storage bins for its medical records, but because of bulk, storage concerns, and weight and safety issues when moving the units, this method is ill advised for most practices.
13.2 Outline the security and safety measures that should be employed when working with paper medical records.	HIPAA requires that filing shelves or cabinets be fireproof and locked when the office is closed. If files are kept in a file room, the room should be locked when not in use, with only a minimal number of staff members possessing the key. Filing systems must be safe for those using them, and instructions on their proper use should be posted and understood by all staff members using them. All staff should be instructed on proper body mechanics regarding all tasks in the medical office to avoid work-related injuries.
13.3 List the common filing supplies used in the medical office.	Filing supplies used in the medical office include tabbed file folders, labels, hanging file folders, binders, tabs with inserts for labeling, file guides, out guides, and file sorters.

LEARNING OUTCOMES

13.4 Contrast the methods used for various filing systems and how color-coding can assist with the filing systems.

KEY POINTS

Alphabetic filing is the traditional filing system for medical offices. According to the filing rules found in Table 13-1 and the indexing rules in the *Points on Practice* feature, medical records are filed alphabetically using each patient's last name, first name, and middle initial as the first three filing units. Color-coding can enhance this process when each letter is assigned a different color and the first two or three letters of each patient's last name are attached to the chart using colored labels so filing errors stand out. Numeric systems are used more often because of the confidentiality they provide. These systems use a series of numbers assigned to each patient (medical record number), which are then filed by the terminal digit or middle digit format. As with alphabetic filing, color can be used in a similar way with numeric filing by assigning each number 0–9 a distinct color so that filing mistakes stand out more readily.

13.5 Recall the steps in the filing process.

The steps in the filing process include inspecting and releasing, indexing (naming), coding, sorting, and storing.

13.6 Compare active, inactive, and closed files and how to set up a records retention program for the office.

Active records are those that are used frequently. Infrequently used records are known as inactive records. Closed files are those of patients who, for whatever reason, no longer come to the office. Procedure 13-3 outlines the procedure to be used in creating an office medical records retention program.

CASE STUDY CRITICAL THINKING

© HBSS/Corbis RF

Recall Malik Katahri from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding his case.

1. What are some of the advantages of changing the filing system from an alphabetic system to a numeric system?

2. Would there be advantages to staying with the current system? How might you convince the physicians that electronic records would solve the filing “dilemma,” making the financial outlay worthwhile? (Using information from the *Electronic Health Records* chapter may be helpful when answering this question.)

EXAM PREPARATION QUESTIONS

1. (LO 13.1) Which of the following are commonly used in medical offices as storage units for paper medical records?

- a. Filing shelves
- b. Filing cabinets
- c. Compactible files
- d. Rotary circular files
- e. All of these

2. (LO 13.2) Which of the following does not follow recommended security guidelines for medical records?

- a. Locking the records in a separate room
- b. Using locking shelves
- c. Using locking file cabinets
- d. Giving everyone in the office a key to the file room
- e. Posting a sign next to the file room stating “Authorized Personnel Only”

3. (LO 13.3) Which of the following supplies are commonly used to contain the medical record?
 - a. File folders (hanging)
 - b. File markers
 - c. File tabs
 - d. File sorters
 - e. File guides
4. (LO 13.4) Which of the following lists a unit order that would never be used when filing?
 - a. 1. MD 2. Po 3. Kwan 4. Quin
 - b. 1. Quin 2. Kwan 3. Po 4. MD
 - c. 1. Po 2. Quin 3. Kwan 4. MD
 - d. 1. Po 2. Kwan 3. Quin 4. MD
 - e. None of these
5. (LO 13.4) Which of the following lists the correct filing order for the names listed?
 - a. Beals, Bentley Rian/Beals, Jazmyn/Beals, Kim/Beals, Lexus
 - b. Johnson, B. James/Johnson, Bradley/Johnson, Bryan/Johnsen, Calvin
 - c. Stark, Eleanor/Stark, Elinor/Stark-Ward, Eliner/Stark-Ward, Eleanor
 - d. Whalen, Mari/Whalen, Mari L./Whalen, Mary Lou/Whalen, Mari Lou
 - e. Smith, James J. II/Smith, James J. III/Smith, James J. Sr./Smith, James J. Jr.
6. (LO 13.4) Which of the following numeric sequences is correct using middle digit filing?
 - a. 010 333 285 / 001 333 285 / 010 333 284 / 123 334 219
 - b. 001 333 262 / 010 333 285 / 010 333 284 / 123 334 219
 - c. 001 333 262 / 010 333 284 / 010 333 285 / 123 334 219
 - d. 123 334 219 / 010 333 285 / 010 333 284 / 001 333 262
 - e. 010 333 284 / 010 333 285 / 001 333 262 / 123 334 219
7. (LO 13.4) Which of the following numeric sequences uses terminal digit filing?
 - a. 010 333 285 / 001 333 285 / 123 334 285 / 010 334 285
 - b. 001 333 285 / 010 333 285 / 010 334 285 / 123 334 285
 - c. 123 334 285 / 010 334 285 / 010 333 285 / 001 333 285
 - d. 010 334 285 / 010 333 285 / 001 333 285 / 123 334 285
 - e. 010 333 285 / 010 334 285 / 001 333 285 / 123 334 285
8. (LO 13.4) If names are absolutely identical, what is the address order that is used to choose the filing order?
 - a. State, city, street name, street number
 - b. City, state, street number, street name
 - c. Street name, street number, city, state
 - d. City, state, street name, street number
 - e. Each office may choose the order that works best for them
9. (LO 13.5) The filing term that means you are *naming* the document in order to file it correctly is
 - a. Inspecting
 - b. Indexing
 - c. Coding
 - d. Sorting
 - e. Storing
10. (LO 13.6) Which of the following describes the records of patients who have moved across the country?
 - a. Active
 - b. Inactive
 - c. Closed
 - d. Retained
 - e. Old patients

SOFT SKILLS SUCCESS

Recall Malik Katahri, the office manager, from the case study at the beginning of the chapter.

1. One of the issues Malik has noted with internal chart audits is incomplete documentation by one practitioner. What are some of the possible consequences of incomplete or incorrect documentation?

2. How do you think Malik should handle these consequences as the office manager?

Telephone Techniques

CASE STUDY

EMPLOYEE INFORMATION	Employee Name	Position	Credentials
	Reagan Patrick	Medical Assistant Extern	Student
	Supervisor	Date of Hire	Other information
	Malik Katahri	Externship Start: 9/7/20XX	Honors student. Puts a lot of pressure on herself.

Reagan Patrick has been selected by Malik Katahri and his team as their MA extern for this semester. BWW was Reagan's first choice; although excited to be working with this office, she also feels a lot of pressure to be "perfect" during this experience. She has been with them for a few days, and today she will be helping Miguel Perez, the administrative MA, with the phones and front office duties. Reagan feels

© Jose Louis Pelaez Inc./Blend Images LLC RF

she is ready but knows from the little time she has been in the office that as soon as they take the phones off the automated answering system, she is going to have to be at the top of her game as the voice of BWW Medical Associates. As the phone rings for the first time, she takes a deep breath; puts a smile on her face; and, answering on the third ring, says, "Good morning, BWW Medical Associates, this is Reagan, how may I help you?" and her morning begins.

Keep Reagan in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

LEARNING OUTCOMES

After completing Chapter 14, you will be able to:

- 14.1** Explain the purpose of the telecommunications equipment commonly found in the medical office.
- 14.2** Relate the five Cs of effective communication to telephone communication skills.
- 14.3** Define the following terms involved in making a good impression on the telephone: *telephone etiquette, pitch, pronunciation, enunciation, and tone*.
- 14.4** Describe how to appropriately handle the different types of calls coming into the medical practice.
- 14.5** Summarize the purpose of the office routing list with regard to call screening.
- 14.6** Carry out the procedure for taking a complete telephone message.
- 14.7** Outline the preparation required prior to making outgoing calls and the skills used in making the phone call.

KEY TERMS

automated voice response unit	pitch
enunciation	pronunciation
etiquette	telecommunications device for the deaf (TDD)
interactive pager	telephone triage

- V.P.6** Demonstrate professional telephone techniques
- V.P.7** Document telephone messages accurately
- V.A.1** Demonstrate:
 - (a) empathy
 - (b) active listening

4. Medical Law and Ethics

- a. Follow documentation guidelines
- b. Institute federal and state guidelines when releasing medical records or information
- f. Comply with federal, state, and local health laws and regulations as they relate to healthcare settings
 - (2) Describe what procedures can and cannot be delegated to the medical assistant and by whom within various employment settings

8. Administrative Procedures

- f. Display professionalism through written and verbal communications

11. Career Development

- b. Demonstrate professional behavior

► Introduction

Most offices have policies and procedures for routing calls that come into the office. You will learn which types of calls you may handle and which should be directed to clinical medical personnel or the physician. You will learn to triage (prioritize) calls so that emergencies are handled correctly. Of equal importance, you will learn how to take a complete telephone message, how to be prepared when placing calls, how to leave effective and HIPAA-compliant messages for patients, and how to handle difficult telephone calls, including those from angry patients with complaints and from callers who will not identify themselves.

Finally, in addition to using the telephone correctly, you will learn how other communication devices are used in the medical office, including setting up and using automated telephone menu equipment, voicemail, answering services and machines, TDDs, cell phones, and pagers.

► Telecommunications Equipment LO 14.1

When thinking about telecommunications equipment in the medical office, the first item that naturally comes to mind is the office telephone system. In addition to the office telephone line(s), you will also explore how cell phones, beepers, answering machines, voicemail, and answering services play vital roles in the medical office's management.

Telephone System

The telephone is one of the most important pieces of communication equipment in the medical practice. It is not only the primary instrument patients use to communicate with the office but also the primary means of communication among

providers, hospitals, laboratories, and other businesses important to the practice.

Advances in technology and the advent of the Internet are dramatically changing voice communications. Technologies like Voice over Internet Protocol (VoIP), also known as Internet Voice, allow the integration of voice and data communication through the computer and Internet service. This means that medical practices have the option of using the computer for Internet access and telephone conversations.

Multiline Phones

Few practices can function with just one or two telephone lines. Most modern medical offices have a telephone system that includes several telephones and multiple lines for incoming or outgoing calls, an intercom system, and the ability to transfer calls, leave voicemail, and put calls on hold (Figure 14-1).

FIGURE 14-1 Most modern medical offices have multiline phones that are capable of multiple functions.

© McGraw-Hill Education

The larger the practice, the greater the demand on the phone system. Larger practices often need complex communications systems to handle all their needs.

Call Routing

The telephone system can be set up so that all incoming calls ring on all the telephones in the office, but the more common setup is that one or more “main phones” receive all calls. The receptionist then routes calls to the appropriate telephone extensions.

The **automated voice response unit** is quickly becoming a popular alternative to the traditional phone system, which requires someone to answer each call. An automated menu system answers calls for the office, separating requests into categories, so that the appropriate staff member can deal with each call efficiently. Using an automated system saves time for office personnel, because someone does not have to answer each call and then route it manually to the appropriate person or department. This allows the front office staff to complete other work without interruption.

Patients who reach an automated system hear a recorded message identifying the business. The message gives the caller a list of options from which to choose. Keep in mind that the first instruction the caller should hear is that if the call relates to a medical emergency, the caller should hang up and dial 911. After that, the caller will select an option by pressing the corresponding button on the telephone or by speaking the number of the option. The following are typical options that callers hear.

“Press or say 1 for appointments.”

“Press or say 2 for prescription renewals.”

“Press or say 3 for the clinical staff and triage nurse.”

“Press or say 4 for the billing department.”

“Press zero or say ‘operator’ to speak with an administrative medical assistant.”

The last option is of utmost importance, so that the patient never feels lost in the system or unable to reach a “live person.” Once a caller has chosen an option, the call is automatically routed to the chosen department. If no one is immediately available to answer the call, the caller may leave a message on the voicemail system, which should ask the patient to leave her name, the date and time of the call, and a brief message. In order for the voicemail portion of the automated system to be considered “successful” by the patients and other callers, it is imperative that the office staff check the system frequently (at least every hour) and return calls promptly.

Although using an automated voice response unit is efficient for the office staff, its purchase and use must be approved by the office manager and the practitioners before it is implemented. Some practitioners maintain that the patient call, as the customer and the reason for the practice, is of utmost importance above all other office tasks. If that is the belief system of the practitioner, he may be hard-pressed to feel anything other than a “live person” should be the first voice a patient hears when calling the office. Even when an automated system is in the office, always use the system per office protocol, making no changes without speaking to the office manager and licensed practitioners beforehand.

Other Automated Telephone Options

In addition to using automated voice response systems, many practices use an automated system to place routine reminder calls to patients. Medical assistants spend a great deal of time on the telephone calling patients to remind them of appointments, calling patients about no-shows, and leaving other types of messages.

Keeping in mind that some licensed practitioners believe that someone should always answer the phone, many other practitioners feel that they can make better use of staff time by automating as much of the phone system as possible. In fact, the system often pays for itself in less than a year. In addition to reminding patients of upcoming appointments, it can allow them to leave messages for staff. Automated phone systems can offer much more than just financial benefits: They can conduct patient surveys and give patients their test results through a privacy mechanism (the patient inputs his or her password). The phone system also can assist in managing referrals from the managed care organizations requiring them, and it can assist with preventive care by giving direct access to nurses or medical assistants for minor problems and concerns.

Voicemail and the Office Phone

As mentioned earlier, an automated menu often includes voicemail. If the office is closed or the person the patient is calling is on the phone or away from her desk, voicemail answers the call, and the caller can leave a message. The advantage of a voicemail system is that the caller never receives a busy signal. Another advantage is that voicemail is a more secure system, in that each person on a voicemail system has a unique password to retrieve only her messages.

Answering Machine

If the office phone system does not include voicemail, many offices use a telephone answering machine to answer calls after office hours, on weekends and holidays, and when the office is closed for any reason. A typical recorded message announces that the office is closed and states the usual business hours. In addition, the message must always indicate how the caller can reach the covering physician in the case of an emergency.

Answering Service

Instead of, or in addition to, an answering machine, many medical offices use an answering service. Unlike answering machines, answering services provide people who answer the telephone. They take messages and communicate them to the physician on call, who is responsible for handling emergencies that occur when the office is closed—at night or on weekends or holidays. Upon receiving a message from the answering service, the physician returns the patient’s call and decides on the course of action.

Answering services can be used in a number of ways. The medical office may use an answering machine to record calls of a routine nature and give the number of the answering service to call in emergencies. Alternatively, the answering service may have a direct connection to the physician’s office, picking up calls after a certain number of rings day or night or

during specific hours. This ensures that calls do not get missed if the office is very busy and the staff cannot get to the phone.

Some answering services specialize in medical practices. These medical specialty services ask the medical practice to give specific directives for the triage of calls. Although most answering services provide satisfactory, sometimes even outstanding, service, it is good practice to check up on the service every so often by calling it during its coverage hours. This quality check ensures that the service meets office standards and expectations. Always ask any service for references before signing a contract for service.

Cellular (Cell) Phones—Personal and Business Use

Cell phones today are as common as people wearing shoes. In fact, cell phone use is so widespread that many people no longer have a land line. Instead, they depend solely on their cell phones, not only for calls but also for texting, directions, and many online applications (apps) for information and communication. Practitioners, medical practice employees, and patients may all be carrying their own cell phones into the medical office. With all that technology available at a button's touch, cell phone etiquette is a key concern. Generally, it is appropriate to turn off all personal cell phones while inside a medical office. In fact, it is not unusual for offices to have signs posted, requesting that cell phones be shut off when entering the office or at least when patients are in the treatment areas. The patients should be shown the same consideration by the practitioners and medical staff. Cell phone calls from outside the practice are usually an interruption in the communication among the practitioners, the staff, and the patient, who, as the *customer* of the practice, should have your full attention. More important, personal cell phone use should be avoided within the office, as it can interfere with other electronic equipment.

However, cell phones play an important part in the business functioning of the medical office. Licensed practitioners may use a cell phone to respond quickly to a message from staff or a hospital. Office staff may use personal cell phones in an emergency when traditional phone systems fail. Some medical practices even issue a cell phone to key employees who conduct business for the practice outside the office. In addition, patients may use their cell phones to call for a taxi after an appointment. If your medical office allows staff and patient cell phone use, make sure it is clearly noted in which areas cell phone use is permitted and, for employees, when personal cell phones may be used. In most offices, personal cell phones may be used only during break times; at other times, they must be turned off or left in vibrate mode.

Pagers (Beepers)

Physicians and other medical personnel often need to be reached when they are out of the office, so in addition to a cell phone, many also carry pagers (also known as beepers). Pagers are small electronic devices that give the user a signal to indicate that someone is trying to reach him. Although generally considered outdated technology, pagers are still used in some areas, particularly in rural areas, where cell phone signals are not as reliable.

Technology of Paging Like a cell phone, each paging device is assigned a telephone number. When the number is called, the pager picks up the signal and beeps, buzzes, or vibrates to indicate a call has been made. Most pagers have a window that displays either the caller's telephone number or a short message, so that the receiver can return the call. Pagers also can store the telephone number so that the receiver can return several calls without having to write down the numbers.

Calling a Pager Many telephone messages can wait until the physician returns to the office or calls in for messages. When a message needs to be delivered immediately, and a cell phone is not an option, paging is an efficient response. A list of pager (and cell phone) numbers for each physician in the practice should be kept in a prominent place in the office, such as by the main telephone or switchboard. Make sure you know where these numbers are kept. The paging process is as simple as making a telephone call.

1. Look up the telephone number for the pager of the practitioner you need to contact.
2. Dial the telephone number for the pager.
3. You will hear the telephone ringing and the call picked up. Listen for a high-pitched tone, which signals the connection between the telephone and the pager.
4. To operate most pagers, dial the telephone number you wish the practitioner to call, followed by the pound sign (#). (Some pager services have an operator and work much like an answering service. Give the operator a message and the operator will contact the practitioner.)
5. Listen for a beep or a series of beeps signaling that the page has been transmitted. Then hang up the phone. The practitioner should call the number at his earliest convenience.

Interactive pagers (I-pagers) are designed for two-way communication. The individual is paged in much the same way as the traditional pager. The pager can be set on "Audio" or "Vibrate" to alert the carrier that a message is coming in. However, the interactive pager screen displays a printed message and allows the physician to respond by way of a mini-keyboard.

The user can respond to the printed page by typing a return message, which is relayed back to the office in real time. The office computer and the user enter into a conversation much like e-mail or an Internet chat room. Many problems can be handled quickly and efficiently in this manner. Additionally, because the I-pager can function silently, the provider can communicate with her office while in a restaurant without disturbing others or compromising patient confidentiality.

Each interactive pager has its own wireless Internet address. The user types in the receiving party's e-mail address and creates a message on a monitor screen. The interactive pager indicates on the screen when the message has been sent, received, or read. I-pagers can communicate with other I-pagers as well, and they have broadcast capability, meaning the sender can send to more than one receiver at a time. For this reason, I-pagers can be very helpful for practices with multiple practitioners, especially where cell phone service is not always reliable.

I-pagers can also send messages to traditional telephones. The message is typed into the pager and the system “calls” the telephone number. When the telephone is answered, an electronic voice reads the message to the individual who has answered.

Telecommunications Devices for the Deaf

If your office has a significant number of patients with hearing impairments, it may be equipped with a **telecommunications device for the deaf**, known as a **TDD** (formerly known as a TTY—teletypewriter). A TDD is a specially designed telephone that looks very much like a laptop and may have a cradle for a telephone receiver (Figure 14-2). To call the office, the patient places the telephone receiver (if it has one) in the cradle and, instead of speaking, types a message using the TDD keyboard. If the office has a TDD, the message will be received in type format (similar to e-mail) on the TDD screen.

If the office does not have TDD equipment, the message may still be received through the use of a telecommunications relay service (TRS). When a patient utilizes a TRS, a specialty relay operator will receive the patient’s written message through TDD equipment and then read the message to you when you answer the office phone. When a relay operator is used, the operator will identify herself as a relay operator for the patient utilizing the service. She will read the typed information from the patient. When the message is completed, she will say “go ahead” as your signal that it is your turn to reply. You will reply to the patient by speaking to the operator, and she will then enter your reply into the TDD device so that the patient can read it. You will also use the phrase *go ahead* when your message is completed.

TDD devices are becoming more common in the United States and throughout the world. Keep in mind that keying information takes longer than speaking and be patient with the process. As with text messaging, certain abbreviations are commonly used with a TDD. Table 14-1 lists some of them. Procedure 14-1, at the end of the chapter, outlines the procedure for using a TDD.

Effective Telephone Communication

LO 14.2

When you answer the telephone, you may be someone’s first contact with the practice. The impression you leave can be either positive or negative. Your job is to ensure that it is positive.

Good telephone management leaves callers with a positive impression of you, the practitioners, and the practice. Poor telephone management can result in negative feelings, misunderstandings, and an overall unfavorable impression. The image you present over the phone should convey the message that the staff is caring, attentive, and helpful. Showing concern for each patient’s welfare is a quality that patients rate highly when evaluating healthcare professionals. In addition, you must sound professional and knowledgeable when handling telephone calls. Using proper telephone management skills will help keep patients informed and ensure their satisfaction with the medical practice.

FIGURE 14-2 Telecommunications device for the deaf (TDD).

TABLE 14-1 Abbreviations Commonly Used with TDD Devices

Abbreviation	Meaning
GA	Go ahead
SK	Stop keying
SKSK	Call complete
Q	Question
BEC	Because
U	You
UR	Your
PLS	Please
NBR	Number
TMW	Tomorrow
AM	Morning
PM	Night

Communication Skills

Excellent communication skills are important in telephone management because they help project a positive image and thus satisfy the patient’s needs and expectations. Individuals who are adept at effective communication employ the following communications skills:

- Display tact and sensitivity
- Show empathy
- Give respect
- Appear genuine
- Display openness and friendliness
- Refrain from passing judgment or stereotyping others
- Be supportive
- Ask for clarification and feedback
- Use paraphrasing to ensure that you understand what others are saying
- Be receptive to each patient’s needs
- Know when to speak and when to listen

- Exhibit a willingness to consider other viewpoints and concerns

As a medical assistant, in addition to using your *active listening* skills (refer to the *Interpersonal Communication* chapter) you should also apply the five Cs of communication. Doing so will allow you to be as effective when using the telephone as you are when having a face-to-face conversation with someone. Get to know and use the five Cs of effective communication in all forms of communication:

- **Completeness.** The message must contain all necessary information.
- **Clarity.** The message must be legible and free from ambiguity.
- **Conciseness.** The message must be brief and direct.
- **Courtesy.** The message must be respectful and considerate of others.
- **Cohesiveness.** The message must be organized and logical.

Guidelines for Using the Telephone Effectively

The following guidelines will help you use the telephone effectively and professionally.

- Answer the phone promptly, by the second or third ring.
- Hold the telephone to your ear, or use a headset to hold the earpiece securely against your ear. Do not cradle the telephone with your shoulder; doing so can cause muscle strain.
- Hold the mouthpiece about an inch away from your mouth and leave one hand free to write with.
- When answering the phone, greet the caller first with the practice name, then with your name. If accepting a call routed by an automated answering system or forwarded to you by someone else, always identify yourself by name.
- Acknowledge the caller. Demonstrate your willingness to assist the caller by asking, “Ms. Jones, how may I help you?”
- Be courteous, calm, and pleasant no matter how hurried you are.
- Identify the nature of the call and devote your full attention to the caller. Do not attempt to multitask while on the phone.
- At the end of the call, allow the caller to hang up first to be sure any questions have been answered. Always say goodbye and use the caller’s name.

Following HIPAA Guidelines

As you learned in the *Legal and Ethical Issues* chapter, HIPAA is the act concerned with the privacy and confidentiality of patient information, including information communicated via the telephone. Healthcare providers are allowed to disclose patient information for the purpose of treatment, payment, and health care operations (known as TPO) only. Any use of this information outside of these reasons requires a written authorization from the patient, except in emergency situations or in cases of information required by government agencies for compliance issues. As a general rule, patient information should not be revealed over the phone unless you

are speaking directly to the patient or have written consent from the patient to speak to another person about his condition. Always follow your office policy and procedures manual with regard to disclosing patient information.

It is equally important to maintain patient confidentiality regarding patient appointments or their presence in the office. In the same way that you would not share patient information with anyone outside the office, you should never reveal to anyone, whether in person or on the telephone, that a patient has an appointment, is in the office, or is being treated by a member of the healthcare team. It is solely up to the patient to reveal that information.

Telephone Etiquette

LO 14.3

Proper telephone **etiquette** means handling all calls politely and professionally using good manners. Confidence in your role of providing quality patient care includes the ability to communicate effectively not only in person but also on the telephone. Your professionalism and caring attitude must come through the phone to the caller.

Your Telephone Voice

Customer service is critical when using the telephone. After all, your voice is representing the medical office. You must present your message effectively and professionally. Because you cannot rely on body language or facial expressions to help you communicate over the telephone, it is important to make the most of your telephone voice. Use the following tips to make your voice pleasant and effective.

- Speak directly into the receiver. Otherwise, your voice will be difficult to understand.
- Smile. The “smile” in your voice will convey your friendliness and willingness to help (Figure 14-3).

FIGURE 14-3 Smiling comes over the phone, making patients feel you want to help them.

© Thomas Barwick/Getty Images RF

- Visualize the caller and speak directly to that person.
- Convey a friendly and respectful interest in the caller.
- Be helpful and alert.
- Use language that is nontechnical and easy to understand. Never use slang.
- Speak at a natural pace, not too quickly or too slowly.
- Use a normal conversational tone.
- Try to vary your pitch while you are talking. **Pitch** is the high or low level of your speech. Varying the pitch of your voice allows you to emphasize words and makes your voice more pleasant to listen to.
- Make the caller feel important.

Pronunciation Proper **pronunciation** (saying words correctly) is one of the most important telephone skills. If you are unsure how to pronounce the name of the person on the phone, ask him to repeat it for you. This demonstrates respect for the person and shows him that he has your undivided attention. When clarifying the spelling of a name, verify letters that sound alike by repeating the letter, and include a word that begins with that letter. Examples include D as in dog, V as in Victor, and M as in Mary.

Enunciation The term **enunciation** (clear and distinct speaking) means the opposite of *mumbling*. Good enunciation helps the person you are speaking to understand you, which is especially important when you are trying to convey medical information.

Speaking clearly over the telephone is very important, because the speaker cannot be seen. Correct interpretation of the message is determined by hearing the words precisely. Activities like chewing gum, eating, or propping the phone between the ear and shoulder hinder proper enunciation. Many offices today provide the medical assistant and/or the receptionist with a wireless headset. These hands-free devices eliminate the need to hold the phone between your ear and shoulder, reducing office-related neck, back, and shoulder pain. The wireless headset allows you to speak with the patient and multitask if it is related to the reason for the patient's phone call, such as booking an appointment or accessing her electronic health record. See Figure 14-4. Because each patient deserves your undivided attention, you should not perform tasks unrelated to the caller. While using a wireless headset, always keep patient confidentiality in mind. Anything you say can be heard by people within listening range. As a general rule, do not walk around the office while on the phone with a patient unless an emergency demands that you do so.

Tone Because you are not face-to-face with the caller, the most important measurements of good telephone communication are voice quality and tone. Always speak with a positive and respectful tone.

Making a Good Impression

In a sense, your telephone duties include public relations skills. How you handle telephone calls will have an impact on the medical practice's public image.

FIGURE 14-4 Using a hands-free headset allows you to speak directly into the mouthpiece, keeping your hands free to complete a task such as booking an appointment for a patient.

© Image Source RF

Exhibiting Courtesy Show common courtesy by projecting an attitude of helpfulness. Always use the person's name during the conversation and apologize for any errors or delays. When ending the conversation, be sure to ask the caller if there is anything else you can do for him and thank him before hanging up.

Giving Undivided Attention Do not try to answer the telephone while continuing to carry out another task. Before answering the phone, complete any conversations occurring in the office or excuse yourself while you answer the phone. Once you make sure that the call is not for an emergency, ask the caller if you may either put her on hold for a moment or call her back shortly. By interrupting the patient in the office briefly and giving the caller the option as to how she would like her call handled, both patients receive the undivided attention they deserve.

Putting a Call on Hold Although you should try not to put a caller on hold, there will be times when it is unavoidable. Calls may come in on another line, or a situation in the office may prevent you from devoting your full attention to the caller. Sometimes you may have to check a file or ask someone else in the office a question on behalf of the caller. Before putting a call on hold, however, always let the caller state the reason for the call. This step is essential so that you do not inadvertently put an emergency call on hold. Never answer the phone, "Dr. Buckwalter's office, please hold," and immediately put the call on hold. You must ask permission to put the caller on hold and wait for the response.

Your medical office may have a standard procedure for placing a call on hold. Typically, you will ask the caller the purpose of the call, state why you need to place the call on hold, and explain how long you expect the wait to be. Ask the caller if she would like to hold or if she would prefer you to return her call. If she requests a return call, ask her if there is a time that is best for the return call. If she decides to wait on hold and if you cannot end the task at hand quickly, return to the caller every 2 to 3 minutes, asking her if she wishes to remain on hold. An excessive wait on hold makes people feel they have been forgotten or are unimportant. Checking in with them and giving options minimizes these negative thoughts and feelings.

If you know you can return to the line shortly, put the caller on hold and complete your current task or call. If you need to answer a second call, get the second caller's name and telephone number and, unless this call includes an emergency situation, put the call on hold until you have completed the first call. You can then return to the second call. If possible, ask a coworker to assist with the second call, minimizing wait time for both callers.

Returning Patient Calls Some people do not like to hold and will request that you call them back. Obtain the caller's name and phone number, taking the time to repeat both to avoid errors. Return the call in a reasonable amount of time or as close as possible to the time requested by the caller, and give the patient your undivided attention. Be sure to apologize for the inconvenience and thank the caller for her patience.

Remembering Patient Names When patients are recognized by name, they are more likely to have positive feelings about the practice. Using a caller's name during a conversation makes the caller feel important. If you do not recognize a patient's name, it is better to ask, "Has it been some time since you've been in the office?" rather than to ask if the patient has been to the practice before.

Checking for Understanding When communicating by telephone, you do not have visual signals to convey the caller's feelings and level of understanding of the information you are discussing. If a call is long or complicated, summarize what was said to be sure that both you and the caller understand the information. Ask if the caller has any questions about what you have discussed. You may even want to have the caller repeat any instructions to make sure she understands. If a situation requires a lengthy conversation, it might be best to have the patient come in to the office or to follow up the phone call with a written summary of the discussion. Do not forget to document the call in the patient's medical record.

Communicating with Empathy Whenever information is conveyed over the telephone, feelings are also communicated. When dealing with a caller who is nervous, upset, or angry, try to show empathy (an understanding of the other person's feelings). Communicating with empathy helps the caller feel more positive about the conversation and the medical office.

Ending the Conversation It is not useful to let a conversation run on if you can effectively complete the call sooner. Before hanging up, however, take a few seconds to complete the call so that the caller feels properly cared for and satisfied. You can complete the call by summarizing the important points of the conversation and thanking the caller. Let the caller hang up first.

Occasionally, you will encounter a patient who simply will not hang up. Often these patients are merely lonely and your friendliness and helpfulness ease their loneliness. In this case, you may find that you must politely but firmly explain that another patient (or a member of the medical team) needs your assistance and you must complete the call. When you put the receiver down, never slam it—even if the caller has already hung up. Remember, all your actions reflect the medical practice's professional image. Patients in the reception area may see (and hear) you when you are talking on the telephone.

► Types of Incoming Calls

LO 14.4

In dealing with incoming telephone calls, you will encounter a variety of questions and requests from numerous people. Many incoming calls are from patients. You also will receive calls from various people, including attorneys, physicians, pharmaceutical sales representatives, and other salespeople.

Calls from Patients

Patients call the medical office for a variety of reasons, including rescheduling appointments and requesting prescription renewals. If you will be discussing clinical matters over the telephone, it is a good idea to pull the patient's chart. If the office uses EHR technology, this may be as simple as accessing the medical record on the computer screen. If paper records are used, you may need to ask the caller to hold for a moment while you retrieve the record. The information in the chart will often enable you to address any problems quickly. Pulling the chart also allows you to document the conversation immediately.

Always keep in mind that the physician is legally responsible for your actions, including relaying information to patients over the telephone. The office policy manual typically specifies what you may and may not discuss with patients. If you are uncertain about giving particular information to a patient, it is best to discuss the situation with the patient's practitioner or have the practitioner return the patient's call.

Appointment Scheduling Follow office procedures for making or changing appointment times over the telephone. Ask the patient to provide his name, a telephone number where he can be reached during the day, and the reason for the visit. Repeat the information back to the patient to verify all information before ending the call. (Scheduling appointments is discussed in the *Schedule Management* chapter.)

Billing Inquiries If a patient calls about a billing problem, you will need to pull the patient's billing information and possibly the medical record. With this information, you can compare the charges with the actual services performed.

If a patient claims to have been overcharged, check to see if the correct fee was charged. If you find that an error was made, apologize and tell the patient the office will send a corrected statement. Ask the patient to wait for the new statement before sending payment. If, in fact, the proper fee was charged, it may be helpful to speak to the provider before responding to the patient; she may be able to tell you if there were special circumstances regarding the visit or charge in question. Allowing the patient to pay the bill in installments is usually an acceptable option. The details on arranging for payment plans are discussed in the *Patient Collections and Financial Management* chapter.

Many offices use billing services instead of taking care of the insurance submission and monthly patient billing in the office. In that case, the patient may have called the billing service about charges and has now been referred to the office to dispute either the performance of a procedure or its cost. In this case, you may not have access to information about individual charges and may need to refer the patient to the office manager. Be aware that the patient may be upset about the bill and now is being referred to yet another person. Listen patiently to the patient and take notes regarding the complaint, remaining tactful and understanding about his concerns and possible frustration that an answer does not appear to be a simple process. No matter what your office policy is, if a patient is dissatisfied, document all appropriate comments and relay the information to the patient's practitioner and/or the office manager. If a bill has not been paid, ask if there are special circumstances affecting the patient's ability to pay. Figure 14-5 gives an example of appropriate documentation of such a call.

Requests for Laboratory or Radiology Reports If a patient calls the office requesting the results of a test, obtain the patient's chart to see if the report has been received. If it

has not, suggest that the patient call back in a day or two. If the need for the result is urgent, you may call the laboratory or radiology office to obtain the results over the phone.

In some offices, you may be authorized to give laboratory results by telephone if they are normal, or negative, so the patient does not have to wait for results to be mailed or for a return phone call from the practitioner. Make a note on the patient's chart if you provide any information about test results. If a test result is abnormal, the provider will usually wish to speak with the patient. In such a case, tell the patient that the office has received the results and that the provider will call as soon as possible. Then place the patient's chart and the telephone message on the provider's desk. See Figure 14-6 for a chart note example of such a telephone call.

Questions About Medications One of the most common types of calls from patients involves questions about medications. A patient may ask about using a current prescription or may want to renew an existing one.

Prescription Renewals Calls for prescription renewals may come from the patient's pharmacy or from the patient. A pharmacist usually calls to check before dispensing refills if more than a year has passed since the original prescription was written. If the prescriber has indicated in the patient's medical record that renewals are approved, you may authorize the pharmacy to renew a prescription. In any other case, only the prescriber may authorize renewals. If the prescriber authorizes a renewal, you may be asked to telephone it in to the patient's pharmacy. Procedure 14-2 at the end of this chapter outlines the instructions for renewing a prescription by telephone. All renewals must be documented in the

patient's medical record, with the date and the initials of the person authorizing the renewal. See Figure 14-7.

Old Prescriptions Patients may call to ask if they can use a medication that was prescribed for a previous condition. In these instances, recommend that the patient come in for an appointment. Explain why the medication should not be used: It may be old and no longer effective, the current problem may not be the same as the previous one, the medication may not be helpful, and using the medication may mask the symptoms of the current problem, making a diagnosis (and so identifying the proper treatment) more difficult.

If the patient does not want to make an appointment, relay the information to the patient's practitioner, as he or she will probably want to speak with the patient. Again, briefly document the conversation in the patient medical record.

Progress Reports Practitioners often ask patients to call the office to let them know how a prescribed treatment is working. If a patient has a satisfactory progress report, it is not usually necessary that the patient speak to the practitioner. It is important, however, that the medical assistant relay the information to the practitioner and log the call in the patient's medical record immediately. You also may be responsible for

making routine follow-up calls to patients to verify that they are following treatment instructions. See Figure 14-8 for an example of a patient's progress report made by telephone. Figure 14-9 shows a similar patient update phone call documented using an EHR program.

Requests for Advice Sometimes patients call the office about problems or symptoms they are having. Although a patient may ask you for your medical opinion, as a medical assistant, you are not licensed to give medical advice of any kind. Explain that you are not trained to make a diagnosis or licensed to prescribe medication. Stress that the patient must see the licensed practitioner. Listen attentively to the patient. If the patient is in distress, try to schedule an appointment that day or as soon as possible.

If the patient cannot come in to the office, assure her that the practitioner will return the call or that you will call back after discussing the problem with the practitioner. Write down the patient's symptoms completely, accurately, and immediately. In many instances, the practitioner may be able to suggest simple emergency relief measures that you can relay to the patient. Occasionally, a patient will want to speak only with the practitioner, not other staff members. You must honor this request.

In some cases, the healthcare provider may feel that a patient's symptoms warrant immediate attention and will insist on seeing the patient before prescribing any treatment. If the patient refuses to come to the office, note the reason on the chart and suggest a visit to the emergency room or to a nearby medical office or urgent care center. As discussed in the *Legal and Ethical Issues* chapter, it is important to document such conversations completely in the patient's chart, including the refusal of treatment. It is always appropriate and professional to offer to take a message to have the patient's provider return the call. Figure 14-10 gives an example of such documentation.

Complaints Even when an office provides the highest-quality care, complaints still occur. When a patient calls with a complaint, such as a medication that does not appear to be

working, it is important to listen carefully, without interrupting. Take careful notes of all the details and read them back to the caller to ensure that you have written them down correctly. Let the caller know the person to whose attention you will bring the complaint and, if possible, when to expect a response.

Always apologize to the caller for any inconvenience the problem may have caused, even if the problem occurred through no fault of the office. Make sure the proper person receives the information about the complaint.

Sometimes a patient who calls with a complaint is angry. Responding to this type of call can be difficult and uncomfortable.

FIGURE 14-10 Chart note documenting patient refusal of treatment request.

Your first priority is to stay calm and try to pacify the caller. Follow these guidelines when dealing with an angry caller.

- Listen carefully and acknowledge the patient's anger. By understanding the problem, you will be better able to work toward a solution.
- Remain calm and speak gently and kindly. Do not act superior or talk down to the patient. Do not interrupt the patient. Do not return the anger or blame.
- Let the patient know that you will do your best to correct the problem. This message will convey that you care.
- Take careful notes and be sure to document the call.
- Do not become defensive.
- Never make promises you cannot keep.
- Follow up promptly on the problem.
- Any time a staff member has a difficult time with a patient, it is important to inform the patient's practitioner or the office manager, even when the situation is resolved. Always inform the practitioner and/or your supervisor immediately if an angry patient threatens legal action against the office.

Other Calls

Besides calls from patients, a medical office receives many other types of calls. For example, family members and friends of patients may call providers at the office. However, the use of the office telephone is never appropriate for personal calls. Always follow office policies and procedures when handling these calls.

Remember, a patient's information is confidential. As discussed previously, HIPAA requires medical providers to obtain authorization from the patient before any information can be disclosed. This is usually in the form of a written, patient-signed authorization indicating what type of information may be given out and to whom. The following are guidelines for managing calls from attorneys, other physicians, and salespeople.

Attorneys Refer to the procedures listed in the office policies and procedures manual regarding how to handle calls from attorneys. Follow the office guidelines closely and ask the practitioner or practice manager how to proceed if you receive a call that does not fall within the guidelines. Remember, never release any patient information to an outside caller unless the patient's provider has asked you to do so.

Other Physicians Patients at your practice may be referred to surgeons, specialists, and other licensed practitioners for consultations. Consequently, you may receive calls from those providers or from their offices. Route those calls to the appropriate practitioner if the caller requests that you do so. Always remember to ask if the call is about a medical emergency. Also keep in mind that you may not give out any patient information—even to another healthcare provider—unless you have a written, signed release from the patient. The exception to this rule is information requested by practitioners to whom you have referred the patient for care. Because of the referral, there is a contract involved for continuity of care. You may release medical information specific to the care that the practitioner has been asked to provide.

Salespeople As a medical assistant, you will probably be the contact for salespeople, unless the office policy manual states that another staff member should handle this duty. On the telephone, ask the salesperson to send you information about any new products or equipment. Pharmaceutical sales representatives may want to meet with the prescribing practitioners. Forward such messages to the providers with a request to let you know when to schedule the appointment. Many prescribing practitioners see pharmaceutical sales representatives on certain days at specific times. Sometimes they limit the number of representatives they will see in one day or one week. Make sure you know your office policy and each prescriber's preferences.

POINTS ON PRACTICE

Screening Incoming Calls

Each medical office has its own policy about how to screen incoming calls before transferring them to the appropriate person. Calls come not only from patients but also from other physicians, hospital personnel, pharmacists, insurance company personnel, sales representatives, and family members and friends of patients. Here are some general tips for screening calls.

Find out who is calling. A polite way to do this is to say, "May I ask who is calling?" Another option is "May I tell Dr. Williams who is calling?"

Ask what the call is in reference to. When a caller asks to speak with the practitioner, you should ask the purpose of the call. Depending on the answer, you may determine that you or someone else in the office can handle the

situation without disturbing the practitioner. The response may be as simple as solving a billing problem or clarifying instructions. Remember to consider the scope of practice for each member of the healthcare team when you transfer a call. Emergency calls should be transferred to the licensed practitioner right away.

Decide whether the call should be put through. Although most calls are routed to the appropriate person, any callers who refuse to identify themselves should not be put through. In such a case, suggest that the caller write a letter to the practitioner and mark it "Personal."

Determine what to do if the matter is personal. The practitioner may ask you to take a message in these instances. Inform the caller that the practitioner will return the call as soon as possible.

Conference Calls Periodically, providers may need to have a conference call with several individuals. For example, the physician, the nurse, and the medical assistant may need to talk with the insurance company representative at the same time. Telephone conferencing is an ideal setup in this case. All of today’s telephone equipment has features for establishing and joining conference calls. In addition, offices with computerized systems now frequently use WebEx programs, such as “Go to Meeting,” to allow conferencing among many participants.

▶ **Managing Incoming Calls** LO 14.5

Screening Calls

Even if your office uses an automated answering unit, it is likely that part of your responsibility as the office medical assistant will be screening calls. Screening involves deciding which calls should be put through immediately and which calls are better handled by taking a message and allowing a callback at a more convenient time. The *Points on Practice* feature describes some guidelines for screening calls. The procedure will remain basically the same, whether the calls come directly to you as you answer the phone or are directed to you by a telephone answering system.

Routing Calls

Incoming phone calls can generally be separated into three distinct groups: calls dealing mainly with administrative issues; emergency calls that require immediate action by the practitioner; and calls relating to clinical issues that require the attention of the physician, physician assistant, nurse practitioner, office nurse, or clinical medical assistant. Procedure 14-3 at the end of this chapter will provide the outline for you to practice screening and routing calls.

Calls Requiring the Practitioner’s Attention Certain calls will require the practitioner’s personal attention:

- Emergency calls that include serious or life-threatening medical conditions, such as severe bleeding, a reaction to a drug, injuries, poisoning, suicide attempts, loss of consciousness, severe burns, or whatever your medical office deems an emergency; Table 14-2 lists symptoms and conditions that require immediate help
- Calls from other providers
- Patient requests to discuss test results, particularly abnormal results
- Reports from patients concerning unsatisfactory progress
- Requests for prescription renewals (unless previously authorized in the patient’s chart)
- Personal calls

Many practitioners have a set time, such as a half hour in the late morning or at the end of the day, for returning nonemergency patient calls. If a patient prefers to discuss symptoms with his provider, you may tell the patient to expect a phone call from the provider within this set time. If the practitioner

TABLE 14-2 Symptoms and Conditions Requiring Immediate Medical Assistance*	
• Allergic reactions to foods or insect stings • Broken bones: Symptoms include being unable to move or bear weight on the injured body part; the injured part is very painful or looks misshapen • Chemical or foreign objects in the eye • Choking • Drowning • Electrical shock • Fires, severe burns, or injuries from explosions • Heart attack: Symptoms include chest pain or pressure; pain radiating from the chest to the arm, shoulder, neck, jaw, back, or stomach; nausea or vomiting; sweating; weakness; shortness of breath; pale or gray skin color • Heatstroke (sunstroke): Symptoms include confusion or loss of consciousness; flushed skin that is hot and may be moist or dry; strong, rapid pulse • Human bites or any deep animal bites • Hypothermia (drop in body temperature during prolonged exposure to cold): Symptoms include becoming increasingly clumsy, unreasonable, irritable, confused, and sleepy; slurred speech; slipping into a coma with slow, weak breathing and heartbeat • Injuries to the head, neck, or back • Lack of breathing (apnea) or difficulty breathing (dyspnea) • Poisoning • Pressure or pain in the abdomen that will not go away • Severe bleeding • Severe vomiting or bloody stools • Shock: Symptoms include paleness; feeling faint and sweaty; weak, rapid pulse; cold, moist skin; confusion or drowsiness • Snake bites • Stroke: Symptoms include seizures, severe headache, slurred speech, and sudden inability or difficulty in moving a body part or one side of the body • Unconsciousness • Vehicle collisions	
*If someone calls the office on behalf of a patient who is experiencing any of these symptoms or conditions, you may instruct the caller to dial 911 to request an ambulance. Procedure 14-4 at the end of the chapter describes the steps for handling emergency calls. If in the office, the physician should be called to the telephone immediately to offer assistance.	

does not have a set time for returning phone calls, do not make a commitment as to the time of the return phone call.

In many practices, some of these calls may be handled by others on the staff, such as a nurse practitioner or physician assistant. For example, a nurse practitioner may be able to order a renewal of a regular prescription, provide advice for the care of a sprain, or answer well-baby questions or questions about the side effects of a drug.

Calls Handled by the Medical Assistant The most common calls to a medical office involve administrative and clinical issues. Depending on the practice, the office manager or someone in the billing department may handle some administrative calls. The calls handled by the medical assistant may include

- Appointments (scheduling, rescheduling, canceling).
- Questions concerning office policies, fees, and hours.
- Billing inquiries.
- Insurance questions.
- Other administrative questions.
- X-ray and laboratory reports.
- Reports from hospitals regarding a patient's progress.
- Reports from patients concerning their progress.
- Requests for referrals to other doctors.
- Requests for prescription renewals, where prior approval for refills is noted in the chart.
- Complaints from patients about administrative matters.

The Routing List Each medical office has a standard policy that documents how incoming telephone calls are to be routed and handled. A routing list, like the one shown in Figure 14-11, specifies who is responsible for the various types of calls in the office and how the calls are to be handled. For example, the routing list indicates which calls should be put through to the practitioners immediately and which ones can be returned later.

The routing list may simply identify the general title of the person responsible for handling a call. When more than one

person in the office have the same title, however, the name of the individual who has that responsibility should be specified.

Telephone Triage

Depending on individual state regulations and on individual preference, some practitioners delegate part of the clinical decision making that is done over the telephone to other experienced staff members. In these instances, **telephone triage** is used to decide what action to take. The word *triage* refers to the screening and sorting of emergency incidents. Performing triage correctly is an important skill.

Using Triage Guidelines Proper office staff training is vital in providing safe, sound, and cost-effective medical care over the telephone. An increasing number of medical practices are preparing guidelines for the telephone staff to follow when patients call the office with specific medical problems or questions.

Guidelines are often written for common questions, such as how to deal with sniffles and fevers during cold and flu season or how to make a child with chickenpox more comfortable. Members of the telephone staff must realize, however, that their responsibility is to determine whether a caller needs additional medical care. They cannot diagnose or treat the patient's problem.

Office guidelines outline the specific information the telephone staff must obtain from the patient. In general, this information is the same type as that obtained during an office visit and should include the patient's age, the patient's symptoms, when the problem began, and the patient's level of anxiety about the problem.

HANDLING INCOMING TELEPHONE CALLS

Office business			Miguel
Personal business		X	
Salespeople			Miguel

FIGURE 14-11 A routing list identifies the staff member responsible for each type of incoming call.

Categorizing Problems and Providing Patient Education

After the patient information is obtained, the guidelines help the staff categorize the problem according to severity. The medical assistant then decides whether the problem can be handled safely with advice over the telephone, the patient needs to come in to the office, or the problem requires immediate attention at an emergency room. For instance, if a caller is having chest pains, you would be performing a type of triage by instructing her to go to the emergency room immediately, preferably by ambulance.

If a problem is deemed appropriate for telephone management, the guidelines may include recommendations for non-prescription treatment that may relieve symptoms and anxiety. This information falls under the category of patient education. Advise the caller that recommendations are based on the symptoms and are not a diagnosis. Remember, only the licensed practitioner is authorized to make a diagnosis and prescribe medication. Ask the caller to repeat any instructions you give, and tell the patient to call back within a specified time if symptoms do not improve or worsen. Be sure to document in the medical record the critical elements of the conversation that relate to the patient's health status.

▶ Taking Complete and Accurate Phone Messages

LO 14.6

Always have paper or a telephone message pad (Figure 14-12) and pen near the telephone, so that you are prepared to write down messages. Proper documentation protects the provider

if the caller takes legal action. A record of telephone calls also should be included in a patient's file or electronic health record as part of a complete medical history. Because of their importance as part of the patient's legal health record, messages should never be taken on pieces of scrap paper, which are easily misplaced or accidentally discarded.

Documenting Calls

Documenting telephone calls is essential in a medical office, and several options are available to help medical assistants take a complete message every time. You can use the previously mentioned telephone message pads, a manual telephone log book, or an electronic (computerized) telephone log. Again, remember that many calls (for example, those concerning clinical problems or referrals) and the actions or decisions they lead to must be documented in patients' charts. Every entry into a patient's chart is considered a legal document, so the information must be accurate and legible.

Telephone Message Pads You can use preprinted telephone message pads, which often come in brightly colored paper, to record the following information:

- Date and time of the call
- Name of the person for whom you took the message
- Caller's name, or the patient's name if different from the caller
- Caller's telephone number (always include the area code and extension, if any)
- A description or an action to be taken, including comments like "Urgent," "Please call back," "Wants to see you," "Will call back," or "Returned your call"
- The complete message, such as "Dr. Stephenson wants to reschedule the committee meeting"
- Name or initials of the person taking the call

Figure 14-13 shows an example of a completed preprinted telephone message.

The Manual Telephone Log Some medical offices use spiral-bound, perforated message books with carbonless forms to record messages (refer to Figure 14-12). The top copy, or original, of each message is given to the appropriate person, and a copy is kept in the book for future reference in the event that the original is misplaced or accidentally destroyed.

Electronic Telephone Messaging Offices that use practice management software programs often include electronic messaging systems, which allow the telephone messages to be transmitted directly to the intended recipient's computer. These messages may be input directly into the system while on the phone with the caller instead of using the traditional message pad or telephone log that we will be discussing here. Regardless of the method used, the information to be obtained from the caller remains the same and must be complete.

FIGURE 14-12 Using a telephone message pad ensures that no important information is omitted when the message form is filled out completely.

TELEPHONE MESSAGE

For: Kaylyn Haddix

Patient calling as requested with update. She is feeling much better after 3 days on Abx. Temperature is back to normal. No more sore throat; body aches and pains are less.

Name of Caller: Shenya Jones

Name of Patient (if not caller): _____

Date/Time Called: 4/12/20XX @ 11:15 a.m.

Message Taken by: M. Perez, CMA(AAMA)

FIGURE 14-13 It is important that messages be filled out as completely as possible.

Tips for Ensuring Accurate Messages The following suggestions will help you provide accurate documentation for incoming messages:

- Always have a pen and paper on hand. If an electronic system is used, keep the software minimized on your computer screen so you can access it quickly.
- Jot down notes as the information is given.
- Verify information, especially the spelling of patient or caller names and the correct spelling of medications.
- Obtain the patient's full name and date of birth if pulling the chart is necessary, in case there are two patients with the same name.
- Verify the correct callback number.
- When taking a phone message, never make a commitment on behalf of the intended recipient by saying, "I'll have him call you." A more appropriate response would be "I will give your message to Dr. Buckwalter."

Maintaining Patient Confidentiality

Even if you are not using a wireless headset, when you are on the phone with a patient discussing confidential information, be aware of the people around you and the volume of your voice when verifying such information. If necessary, move to a private office for such conversations so that patient

confidentiality will not be inadvertently breached. When leaving paper patient messages for a practitioner containing confidential information, insert the message into a folder marked "Confidential" so it cannot readily be seen by others. If using an electronic system, each user will access the system using his or her confidential password to access all messages, allowing for maintenance of confidentiality.

► Placing Outgoing Calls

LO 14.7

You will often be required to place outgoing calls on behalf of the medical office. You may need to return calls, obtain information, provide patient education, pick up messages from the answering service or voicemail, or arrange patient consultations with other physicians. If you are making a long-distance call, it is important to determine the time zone and the time of day in the location you are calling before you place the call. Time zones can be determined by checking the front of the phone book, going online, or speaking with a telephone operator. For information on time zones, go to <http://www.time.gov>.

Locating Telephone Numbers

The medical office should have at least one telephone directory, or telephone book, for the local calling area and perhaps additional directories for surrounding areas. Use these books, an Internet phone directory such as <http://www.anywho.com/> (by AT&T), the company website, or directory assistance to locate telephone numbers for outside calls. The office also may have a card file, a list, or an electronic record of commonly used telephone numbers, or these numbers may be listed in the office policies and procedures manual. If you are calling a patient, the telephone number should be in the patient's chart.

If you need to find a long-distance telephone number, many offices use the directory assistance service. You can reach this service by dialing 1-[area code]-555-1212. You also can search the Internet for free "411" services. Use directory assistance only when you have exhausted other options, however, because most long-distance carriers charge a fee each time you use the service. If you are required to call out of the country, you will need to use an international dialing code. These codes, as well as area codes and long-distance numbers, can be located through the Internet and through directory assistance. Two websites that are helpful for finding information on area codes are <http://www.lincmad.com/areacodemap.html> and <http://www.nanpa.com>.

Applying Your Telephone Skills

You can apply the telephone skills you use for answering incoming calls when placing outgoing calls. Here are additional tips for handling outgoing calls:

- Plan before you call. Have all the information you need in front of you. Plan what you will say and decide what questions to ask so you will not have to call back for additional information.
- Double-check the telephone number. If in doubt, look it up in the telephone directory. If you do dial a wrong number, be sure to apologize for the mistake.

- Allow enough time, at least a minute or about eight rings, for someone to answer the telephone. When calling patients who are elderly or physically disabled, allow additional time.
- Identify yourself. After reaching the person to whom you placed the call, give your name, and state that you are calling on behalf of the doctor or practice.
- Ask if you have called at a convenient time and whether the person has time to talk with you. If it is not a good time, ask when you should call back.
- Be ready to speak as soon as the person you called answers the telephone. Do not waste the person's time while you collect your thoughts.
- If you are calling to give information, ask if the person has a pencil and piece of paper available. Do not begin with dates, times, or instructions until the person is ready to write down the information.

Reaching Voicemail or an Answering Machine On occasion, it is important to leave a message on a patient's answering machine or voicemail. It is now required by HIPAA law that you use these pieces of equipment correctly and confidentially to guard the patient's private medical information. The goal in calling a patient's home is to speak directly to the patient or to leave a message with enough information to get the patient to call back. It is unlawful to disclose confidential patient information to anyone but the patient. HIPAA requires that you *never* leave any information if you are unsure of the phone number dialed. As a medical assistant, you cannot ensure that only the intended patient will receive any message left on an answering machine or voicemail. To guard the patient's privacy, *state only the following information*:

- The name of the individual for whom the message is intended
- The date and time of the call
- The name of your office or practice (see caution below)
- Your name as the contact person in the office (see caution below)
- The phone number of your office or practice
- The hours the office is open for a return call

A word of caution: Leave the name of the practice only if it does not reveal the purpose of the call. For instance, you would not state, "Please call Tiffany Heath from the STI Clinic." An example of an appropriate substitute is "Please call Tiffany Heath from Dr. Greene's office at 413-788-0001, Monday through Friday between 8 a.m. and 5 p.m."

Alternatively, when patients sign the Office Privacy Agreement, a release may be added inquiring if messages may be left on an answering machine or voicemail and if there are any restrictions to that permission. A second release also may be added asking if there is anyone at the home number to whom

the office may speak and the relationship of that person to the patient. Each release should be signed and dated by the patient.

Improper or careless use of a patient's answering system or voicemail (or fax machine) can be viewed as abusive behavior in the eyes of the law. It is imperative that the patient's right to privacy be carefully guarded at all times. If in doubt whether a patient's privacy might be violated by leaving a verbal (or written message) on a machine, it is best to leave no message at all but to attempt to reach the patient at a different time. Further information regarding this topic can be accessed on the HIPAA website, <http://www.hipaa.org>.

Retrieving Messages from the Answering System or Service

If callers are allowed to leave messages on an answering machine or a voicemail system, the medical assistant is usually responsible for retrieving these messages at the start of each day and, if the office closes for a lunch break, to check for messages after this break as well. Never use the speakerphone setting when retrieving messages from an answering machine, as a patient may leave personal information in a message that might be heard by others in the office. This could be considered a breach of patient confidentiality.

When an answering service is used, it is a good idea to call the service to retrieve messages at a set time (or multiple times, if the service or system is employed during office hours) each day. In doing so, you ensure that messages are not missed. When calling the service to retrieve messages, as when taking any message, verify the information for correctness and completeness before ending the call. Procedure 14-5, located at the end of this chapter, describes how to do this.

Arranging Conference Calls

It may be necessary for you to schedule conference calls with patients, hospital personnel, or other practitioners to discuss tests or surgical results. When dealing with several people, suggest several time slots in case someone is not available at a particular time. Also keep in mind the various time zones in the country. Make sure that all the conference call participants are given the proper time in their time zone to expect the call. As mentioned earlier in this chapter, the office phone system will likely have an option allowing you to set up a conference call.

Additionally, there are services that provide "call-in conferencing." The host will provide a number and the time for you or your physician to call in as a participant, or your office may host the call. All of the participants are given a code and are asked to identify themselves as they call into the system. They will ask for an e-mail address to confirm the information, time, date, and passcodes that will be given to each individual. More information on free conference calling services can be found online. Two such services can be found at <http://www.freeconference.com> and <http://www.freeconferencecalling.com>.

PROCEDURE 14-1 Using a Telecommunications Device for the Deaf (TDD)

Procedure Goal: To properly communicate with the hearing-impaired patient using a TDD

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Telephone, TDD (if available), patient chart for documentation, and a pen

Method:

Answering a Call with a TDD

1. Answer the phone as usual. If you hear a rapid clicking sound, you know you have a TDD call. You may hear no sound at all; do not hang up, as it may still be a TDD call.
RATIONALE: *It is important to listen carefully, so as to not hang up on the patient.*
2. If you know (or believe) this is a TDD call, place your phone receiver on the TDD as directed.
3. Type your normal office greeting: "BWW Medical Associates, this is Miguel. How may I help you?"
RATIONALE: *It is important to always identify the practice and then yourself, so the caller knows he has reached the correct party.*
4. When you complete your message, type "GA," which stands for "Go Ahead." This tells the patient you have completed your message and it is his turn to respond.
5. Give the patient time to type his response. When you see "GA" at the end of his message, it is your turn to respond.
6. When the patient receives all of the information required, he will type "Bye, SK," which stands for Good-Bye, Stop Keying.
7. If you agree the call is completed, you may also reply "Bye, SK." This will give the patient the opportunity to be the one to end the call.

8. When you receive a response of "SKSK" (Stop Keying, Stop Keying), the conversation is complete and you may hang up and turn off the TDD.

RATIONALE: *As with a hearing/speaking patient, it is important to let the person initiating the call also be the person to end the call. This way, you know you have answered all questions and provided all needed information to the caller.*

Making a Call with a TDD

1. Turn on the TDD.
2. Dial the patient's phone number on your standard telephone and listen for the phone to ring.
3. When you hear the TDD sound, place the phone receiver on the TDD as directed.
4. After the patient types a greeting and "GA" appears on the TDD display, identify yourself and proceed with the conversation.
RATIONALE: *It is important to identify yourself and where you are calling from when making any call.*
5. Remember to type "GA" when you complete your message so the patient knows it is his turn to respond.
RATIONALE: *This is the only way the patient will know you have completed your communication and it is his turn to respond.*
6. Even though you were the one to initiate the call, you should still allow the patient to make the decision that the call is completed by keying "SKSK."
RATIONALE: *You are providing a service to the patient. It is important to make sure that all information has been received and understood by him by letting him end the call.*

PROCEDURE 14-2 Renewing a Prescription by Telephone

WORK // DOC

Procedure Goal: To ensure a complete and accurate prescription is received by the patient

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Telephone, appropriate phone numbers, message pad or prescription refill request form, pen, and patient chart or progress note with prescription order

Method:

1. Take the message from the call or the message system. For the prescription to be complete, you must obtain the patient's name, date of birth, phone number, pharmacy name and/or phone number, medication, and dosage.
2. Follow your facility policy regarding prescription renewals. Typically, the prescription is usually called into the pharmacy the day it is requested. An example policy may be posted at the facility and may state "Nonemergency prescription refill requests must be made during regular business hours. Please allow 24 hours for processing."
3. Communicate the policy to the patient. You should know the policy and the time when the refills will be reviewed. For example, you might state, "Dr. Williams will review the prescription between patients and it will be telephoned within 1 hour to the pharmacy. I will call you back if there is a problem."

RATIONALE: Letting the patient know the policy demonstrates good communication skills and will result in fewer misunderstandings as to when the prescription will be available for pickup.

4. Obtain the patient's chart or reference the electronic chart to verify you have the correct patient and that the patient is currently taking the medication. Check the patient's list of medications, which is usually part of the chart.
5. Give the prescription refill request and the chart to the physician or prescriber. Do not give a prescription refill request to the licensed practitioner without the chart or chart access information. Wait for an authorization from the practitioner before you proceed.

RATIONALE: All prescription refills must be authorized by the physician.

6. Once the practitioner authorizes the prescription, prepare to call the pharmacy with the renewal information. Be certain to have the practitioner order, the patient's chart, and the refill request in front of you when you make the call. The request should include the name of the drug, the drug dosage, the frequency and mode of administration, the number of refills authorized, and the pharmacy's name and phone number. Note: You cannot call in Schedule II or III medications; these are medications that have the greatest possibility of abuse. Renewals can be called in for Schedule IV and V medications.
7. Telephone the pharmacy. Identify yourself by name, the practice name, and the practitioner's name.
RATIONALE: Only an identified representative from a medical practice can authorize a prescription refill.
8. State the purpose of the call (example: "This is Miguel Perez from BWW Medical Associates. I am calling to request a prescription refill for a patient.").
9. Identify the patient. Include the patient's name, date of birth, address, and phone number.

RATIONALE: It is essential that the correct drug be prescribed for the correct patient according to the physician's order.

10. Identify the drug (spelling the name when necessary), the dosage, the frequency and mode of administration, and any other special instructions or changes for administration (such as "take at bedtime").

RATIONALE: Accuracy and complete information are essential for medication administration.

11. State the number of refills authorized.
12. If leaving a message on a pharmacy voicemail system set up for prescribers, state your name, the name of the doctor you represent, and your phone number before you hang up.

RATIONALE: If the pharmacist has any questions, she must be able to reach the physician.

13. Document the prescription renewal in the chart after the medication has been called in to the pharmacy. Include the date, the time, the name of the pharmacy, and the person taking your call. Also include the medication, dose, amount, directions, and number of refills. Sign your first initial, last name, and title. In an EHR, your credentials may be on file. Refer to Progress Note:

BWW PROGRESS NOTE	
Patient Name:	Shenya Jones
	Rx telephoned to Beth Stone at Noname Pharmacy: Zyrtec 10 mg, one tablet daily at bedtime, #30, 6 refills
Date:	05/03/XX
Author:	M.A. Perez
Done	Close

PROCEDURE 14-3 Screening and Routing Telephone Calls

WORK // DOC

Procedure Goal: To properly screen incoming telephone calls

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Telephone, telephone message sheet, pen or pencil, appointment book or computerized scheduling software (computer), and office routing list

Method:

Use the office routing list to route calls appropriately.

1. Make sure all of the materials are within reach of the telephone equipment.
2. Answer the telephone promptly within two to three rings.
3. Identify the medical office and identify yourself. Make sure you know office procedure for answering the phone

in your facility even if a telephone answering system is employed to route calls to you—for example, "BWW Medical Associates, this is Malik, how may I help you?"

4. If the caller does not identify himself, ask him to do so and the number he is calling from, and write down this information. Find out the reason for the call. Is it an emergency? (Refer to Table 14-2.) If so, follow office policy.

RATIONALE: As soon as you make certain a call is an emergency, it is important for the patient's welfare that you follow the office protocol for these situations.

5. If you can handle the call, take care of the query. Listen carefully to what the caller has to say, paying particular attention to tone and feeling.

RATIONALE: If the caller's query is within your scope of practice and job description, it is up to you to take

care of the patient's problem or request as quickly and professionally as possible.

6. If this is a call that needs to be transferred to someone (per the routing list), tell the caller to whom and to what number you will be transferring the call. Make sure you write down the caller's name and phone number in case the call is accidentally dropped. If the other staff member does not answer promptly or is on another line, ask the caller if he would like to be transferred to the staff member's voicemail (if available) or would like to leave a message.
7. If you need to take a message, make sure you repeat the information that is given to you, especially the name of the person and his phone number. Take a complete message.
RATIONALE: *If the message is not complete, the person receiving it may not take the appropriate action or the patient may end up needlessly being directed to multiple people.*

HANDLING INCOMING TELEPHONE CALLS

FIGURE Procedure 14-3 Step 6 Use the office routing list to route calls appropriately.

PROCEDURE 14-4 Handling Emergency Calls

WORK // DOC

Procedure Goal: To determine whether a telephone call involves a medical emergency and to learn the steps to take if it is an emergency call

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Office guidelines for handling emergency calls; list of symptoms and conditions requiring immediate medical attention; telephone numbers of area emergency rooms, poison control centers, and ambulance transport services; and telephone message sheets or a telephone message log

Method:

1. When someone calls the office regarding a potential emergency, remain calm.
RATIONALE: *This attitude will help calm the caller and enable you to gather necessary information in the most efficient manner.*
2. Obtain the following information, taking accurate notes:
 - a. The caller's name
 - b. The caller's telephone number and the address from which the call is being made
RATIONALE: *It may be necessary for you to put the call on hold or to hang up so you can call for medical assistance. Before you do so, however, be sure to read the information back to the caller to ensure that you have written it down correctly. If you deem the call a medical emergency, ask another medical assistant to dial 911 and give the information you have written down.*
 - c. The caller's relationship to the patient (if it is not the patient who is calling)
 - d. The patient's name (if the patient is not the caller)

- e. The patient's age
- f. A complete description of the patient's symptoms
- g. If the call is about an accident, a description of how the accident or injury occurred and any other pertinent information
- h. A description of how the patient is reacting to the situation
- i. Treatment that has been administered
3. Read back the details of the medical problem to verify them.
RATIONALE: *Details are necessary to determine whether or not an emergency exists and the steps you need to take next.*
4. If necessary, refer to the list of symptoms and conditions that require immediate medical attention to determine if the situation is indeed a medical emergency.

If the Situation Is a Medical Emergency

1. Put the call through to the patient's provider immediately, or handle the situation according to the established office procedures.
RATIONALE: *Medical emergencies take precedence over all other matters.*
2. If the provider is not in the office, follow established office procedures. These may involve one or more of the following:
 - a. Transferring the call to the nurse practitioner or other medical personnel, as appropriate
 - b. Instructing the caller (if not the patient) to hang up and dial 911 to request an ambulance for the patient
 - c. Instructing the patient to be driven to the nearest emergency room

- d. Instructing the caller to telephone the nearest poison control center for advice and supplying the caller with its telephone number
- e. Paging the doctor

If the Situation Is Not a Medical Emergency

1. Handle the call according to established office procedures.
2. If you are in doubt about whether the situation is a medical emergency, treat it as an emergency. You must always alert

the patient's provider immediately about an emergency call, even if the patient declines to speak with the doctor.

RATIONALE: *It is better to be overly cautious than to let an emergency go untreated. The doctor should be the one to decide how to handle these situations.*

PROCEDURE 14-5 Retrieving Messages from an Answering Service or System

WORK // DOC

Procedure Goal: To follow standard procedures for retrieving messages from an answering service or system

OSHA Guidelines This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Telephone message sheets, manual telephone log, or electronic telephone log

Method

1. Set a regular schedule for calling the answering service (system) to retrieve messages.
RATIONALE: *A regular schedule ensures the procedure will not be forgotten and calls will not be missed.*
2. Call at the regularly scheduled time(s) to see if there are any messages.
3. If calling a service, identify yourself and state that you are calling to obtain messages for the practice.
RATIONALE: *Most services have a list of people at the office who are allowed to pick up messages.*
4. If calling an answering system, when the call is answered, you will enter the passcode for the office.
RATIONALE: *The passcode is given only to staff members allowed to retrieve messages.*
5. For each message, write down all pertinent information on the telephone message pad or telephone log, or key it into the electronic telephone log. Be sure to include the caller's name and telephone number, time of call, message or description of the problem, and action taken, if any.

FIGURE Procedure 14-5 Step 5 Write down all pertinent information to take a complete message.

© Royalty-Free/Corbis

RATIONALE: *Always take a complete message for the convenience of the caller and the person receiving the message.*

6. If calling an answering service, repeat the information, confirming you have the correct spelling of all names and the complete, correct information.
RATIONALE: *This step ensures you have the information correct.*
7. If calling an answering system, be sure you listen carefully and replay messages if necessary to get complete information given within each message.
RATIONALE: *This step ensures you have complete and correct information.*
8. When you have retrieved all messages, route them according to office policy.

S U M M A R Y O F L E A R N I N G O U T C O M E S

LEARNING OUTCOMES

- 14.1 Explain the purpose of the telecommunications equipment commonly found in the medical office.**

KEY POINTS

Telecommunications equipment found in the medical office includes multiline phones for incoming and outgoing calls, which may include voicemail for picking up messages; an automated voice response unit to route calls automatically to the correct person or department using a series of prompts, answered by the caller; an answering machine or answering service to pick up calls and messages when the office is extremely busy or after business hours; and cell phones and/or beepers to reach medical

LEARNING OUTCOMES	KEY POINTS
	staff when they are not in the office. Additionally, a TDD may be found in the office—for communication with deaf patients.
14.2 Relate the five Cs of effective communication to telephone communication skills.	The five Cs of effective communication are important in all types of communication, and the telephone is no exception. All forms of communication are more easily understood using these principles: completeness of the message, clarity of the message, conciseness of the information, courtesy when delivering the message, and cohesiveness (logic and organization) of the message.
14.3 Define the following terms involved in making a good impression on the telephone: <i>telephone etiquette, pitch, pronunciation, enunciation, and tone.</i>	Telephone etiquette means to handle all calls professionally and politely using good manners. Pitch is the high or low level of your voice, projecting interest in what you are saying. Pronunciation is saying words correctly, and enunciation is saying them clearly. Tone projects how you are feeling; in the office, your tone should always be positive and respectful.
14.4 Describe how to appropriately handle the different types of calls coming into the medical practice.	The medical assistant may receive calls from patients, attorneys, and others. Always refer to the office policies and procedures manual regarding how to handle incoming calls appropriately. Remember, always be courteous to the caller.
14.5 Summarize the purpose of the office routing list with regard to call screening.	Screening calls categorizes the importance of the call in regard to how quickly the patient's problem or question needs to be handled. The routing list is a guideline for the entire staff to recognize which types of calls should go to each member of the medical staff, following office protocol as to the duties and scope of practice for each team member.
14.6 Carry out the procedure for taking a complete telephone message.	In addition to complete information from the caller regarding what the call is about, each complete telephone message should contain the following information: date and time of the call; name of the person for whom the message was taken; the caller's name and name of the patient (if different from the caller); the caller's telephone number with area code; a description or action to be taken; a complete and concise message; and the name or initials of the person taking the message.
14.7 Outline the preparation required prior to making outgoing calls and the skills used in making the phone call.	Prior to placing an outgoing call, be sure to have all necessary information in front of you, including the name of the person to be reached and the correct phone number. Dial the number carefully, identifying yourself when the phone is answered, asking for the person you need to reach. As always, use the five Cs of communication to complete the exchange.

CASE STUDY CRITICAL THINKING

© Jose Louis Pelaez Inc./
Blend Images LLC RF

Recall Reagan Patrick from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding her case.

1. The first phone call is easy—a routine appointment for next week, which Reagan books without a problem. The next caller states he must speak with Dr. Buckwalter immediately. How should Reagan handle this call?

2. The next call is Nancy Evans. Reagan remembers from her appointment earlier this week that Mrs. Evans has possible early-onset dementia. Mrs. Evans states she has not seen Dr. Williams in several months and wants to know why she does not “care about her anymore.” While Reagan is trying to speak with Mrs. Evans, another line rings. How should Reagan handle Mrs. Evans and the ringing phone?

EXAM PREPARATION QUESTIONS

- (LO 14.1) Which of the following is *not* a common function of many of today's multiline phones?
 - Transfer options
 - Hold
 - Voicemail
 - Intercom
 - Voice recognition
- (LO 14.1) What is the main reason pagers are not used as often in medical offices?
 - Physicians hate carrying them
 - Improved healthcare means fewer "emergencies"
 - Cell phones are being used more often
 - It is becoming harder to find signals for pagers
 - E-mail is used more often
- (LO 14.2) Which of the following is *not* one of the five Cs of effective communication?
 - Compassion
 - Clarity
 - Conciseness
 - Cohesiveness
 - Completeness
- (LO 14.2) Which of the following is an appropriate statement for answering the office telephone?
 - "Doctor's office, Jayden speaking."
 - "Jayden here, this is BWW Medical Associates."
 - "BWW Medical Associates, Jayden, hold please."
 - "BWW Medical Associates; this is Jayden. How may I help you?"
 - All of these
- (LO 14.3) Speaking clearly and distinctly is called
 - Tone
 - Enunciation
 - Etiquette
 - Pronunciation
 - Clarity
- (LO 14.4) Which of the following is *not* a common reason patients call the office?
 - Appointment requests
 - Billing inquiries
 - Lab or X-ray reports
 - Compliments to the medical staff
 - All of these
- (LO 14.5) Deciding how emergent a patient's problem is and how it may best be handled is a procedure known as
 - Screening
 - Routing
 - Triage
 - Paging
 - Etiquette
- (LO 14.5) _____ is being done when a call is transferred to an appropriate person based on the caller's request.
 - Screening
 - Routing
 - Triage
 - Paging
 - Etiquette
- (LO 14.6) Taking an effective message involves which of the following items?
 - Date and time of call
 - Whom the call is for
 - Name and phone number of caller
 - Message and action to be taken
 - All of these and more
- (LO 14.7) When placing a call to a patient with medical information, if you reach the patient's answering machine, what should you do?
 - Leave a complete message; it is the patient's private answering machine
 - Leave your name, the name of the practice, and your phone number so the patient can call back
 - Leave your name and phone number, stating there is a medical issue that requires discussion
 - Leave the practice name only if the reason for the call is not easily identifiable, your name, and your phone number; if unsure, try calling back at another time
 - Leave your name and number with no message

Go to CONNECT to see activities on *Documenting a Patient Message* and *Sending and Processing a Patient Message*.

SOFT SKILLS SUCCESS

Recall Reagan Patrick from the case study at the beginning of the chapter.

- Reagan is on the phone with Nancy Evans, who is obviously confused about when she last saw her physician. What type of soft skills should be used with this patient?
- Later, while at break, another employee who heard about the phone call from Mrs. Evans started laughing about the "crazy woman" who did not remember coming in to

the office a couple of days ago. How should Reagan (or you) respond to such a comment?

Go to PRACTICE MEDICAL OFFICE and complete the module Admin: Check In - Office Operations.

chips and chocolate milk when you take her into the exam room. She states she has taken the medication she was given for her “sugar” and she knows the doctor wants to do a special “sugar test” this time. Her medication list includes Januvia, 100 mg daily, which is a medication to help lower her blood sugar.

Keep Sylvia Gonzales in mind as you study the chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

 **ACTIVSim**

LEARNING OUTCOMES

After completing Chapter 15, you will be able to:

- 15.1** Identify the benefits of patient education and the medical assistant's role in providing education.
- 15.2** Describe factors that affect learning and teaching.
- 15.3** Implement teaching techniques.
- 15.4** Choose reliable patient education materials used in the medical office.
- 15.5** Explain how patient education can be used to promote good health habits.
- 15.6** Describe the types of information that should be included in the patient information packet.
- 15.7** Describe the benefits and special considerations of patient education prior to surgery.

KEY TERMS

- | | |
|------------------------|----------------------|
| consumer education | philosophy |
| factual teaching | return demonstration |
| modeling | screening |
| participatory teaching | sensory teaching |

- V.C.6** Define coaching a patient as it relates to:
 - (a) health maintenance
 - (b) disease prevention
 - (c) compliance with treatment plan
 - (d) community resources
- V.C.8** Discuss applications of electronic technology professional communication
- V.P.4** Coach patients regarding:
 - (a) office policies
 - (b) health maintenance
 - (c) disease prevention
 - (d) treatment plan
- V.P.9** Develop a current list of community resources related to patients' healthcare needs
- V.P.10** Facilitate referrals to community resources in the role of a patient navigator
- VI.P.6** Utilize an EMR
- X.C.3** Describe components of the Health Information Portability and Accountability Act (HIPAA)
- X.P.3** Document patient care accurately in the medical record

2. Anatomy and Physiology

- d. Apply a system of diet and nutrition
 - (ii) Educate patients regarding proper diet and nutrition guidelines

4. Medical Law and Ethics

- f. Comply with federal, state, and local health laws and regulations as they relate to healthcare settings
 - (1) Define scope of practice for the medical assistant within the state that the medical assistant is employed

7. Records Management

- b. Utilize Electronic Medical Records (EMR) and Practice Management Systems

8. Administrative Procedures

- f. Display professionalism through written and verbal communications

9. Clinical Procedures

- h. Teach self-examination, disease management, and health promotion
- i. Identify community resources and Complementary and Alternative Medicine practices (CAM)
- j. Make adaptations with patients with special needs

11. Career Development

- b. Demonstrate professional behavior

► Introduction

Health education should be a lifelong pursuit for all of us. The ultimate goal of all medical professionals is to encourage and teach healthy habits and behaviors to all patients. People first have to understand what is good for them, and then they have to make a decision to follow that advice. In patient education, the medical assistant shares health information and encourages patients to make good health decisions.

In this chapter you will learn about patient education. Understanding your role and scope of practice related to patient education is necessary. Then you will develop skills in recognizing and overcoming roadblocks to education. You will become more comfortable with teaching and demonstrating procedures to others. Most importantly, you will begin to recognize the incredible responsibility of the medical assistant to correctly lead others to their highest level of health.

► The Educated Patient

LO 15.1

Patient education is an essential process in the medical office. It encourages patients to take an active role in their medical

care. It results in better compliance with treatment programs. When patients are suffering from illness, disease, or injury, education can often help them regain their health and independence more quickly. Simply put, patient education helps patients become healthy and stay healthy. Educated patients are more likely to comply with instructions if they understand the “why” behind the instructions. Also, educated patients are more likely to be satisfied clients of the practice.

Patients benefit from education, but the medical office benefits as well. Preoperative instruction to surgical patients, for example, lessens the chance that procedures will have to be rescheduled because surgical guidelines were not followed. Educated patients will also be less likely to call the office with questions. Thus, the office staff will have to spend less time on the telephone.

Patient education takes many forms and includes a variety of techniques. It can be as simple as answering a question that comes up during a routine visit, or it can be detailed instruction regarding a procedure such as wound care. In some cases, it may involve printed materials. In others, the patient may be asked to participate by responding correctly to instructions. As a medical assistant, the amount and type of

CAUTION: HANDLE WITH CARE

Patient Education and Scope of Practice

A medical assistant must be competent and knowledgeable before he or she can provide patient education. If a licensed practitioner asks you to perform education, the content of that education must be approved by that practitioner. You must understand the content in order to teach it, but you should not go beyond the content you have been asked to teach. In addition, while performing education, you must not make any judgments or answer any questions that require diagnosis, assessment, or evaluation.

patient education you provide will be decided by your place of employment and scope of practice. See *Caution: Handle with Care: Patient Education and Scope of Practice*. Even if you are not providing the education, you should be aware of the patient's educational needs and ability to understand. In addition, being a role model by practicing good health behaviors is important.

► Learning and Teaching

LO 15.2

In order to provide patient education, it is necessary to understand the process of learning. Learning is the acquiring of new knowledge, behaviors, or skills, which are also known as the *domains of learning*. Knowledge, the cognitive domain, includes the factual or practical understanding of a subject and the ability to recall it. Behavior, the affective domain, is how one approaches learning. It includes feelings, values, appreciation, enthusiasms, motivations, and attitudes. Skills, the psychomotor domain, include physical movement, coordination, and use of motor skills to complete a task. See Figure 15-1.

To better understand these domains, let's use the example of our patient, Sylvia Gonzales, who just found out she is diabetic. In order for her to be able to manage her diabetes and have the best outcome for her health, she will need to learn through all three of the domains.

- *Cognitive (knowledge)*: Sylvia will need to understand the basic information about diabetes, including the effects of diet, exercise, and treatments. The information can come in many formats, as discussed later in this chapter.
- *Affective (behaviors)*: Sylvia must have the desire or be motivated to make a change in order to improve her health. Once she appreciates the need, is motivated, and has a positive attitude, she will then be able to make the change. This is part of the learning process. If she does not have the desire to learn about diabetes or is not motivated to improve her health, she will not make any change. Being aware of a patient's level of motivation and

encouraging the patient are important parts of the teaching process.

- *Psychomotor (skills)*: Once Sylvia has the basic knowledge and correct behavior, she will be able to learn and perform the skills necessary to improve her condition and keep her diabetes under control. This may include eating better foods, increasing exercise, and taking any medications that are prescribed.

For learning to occur, all three domains of learning must be considered during the teaching process. The patient, Sylvia, must be provided the information, she must be motivated and have a desire to learn the information, and then she must perform the skills, doing what is necessary to improve her condition.

► Teaching Techniques

LO 15.3

Patient education can take many forms. Any instructions—verbal, written, or demonstrative—that you give to patients are types of patient education. When providing education, three types of teaching can occur: factual, sensory, and participatory. These three types of teaching correspond to the three domains of learning.

The combination of these teaching methods gives the patient an overall understanding, because it encourages learning through all three of the domains of learning.

FIGURE 15-1 Learning occurs through three domains: cognitive, affective, and psychomotor. Teaching is accomplished by factual, sensory, and participatory techniques.

(top) © Purestock/Getty Images RF; (left) © Jose Luis Pelaez/Blend Images LLC RF; (right) © ERproductions Ltd/Blend Images LLC RF

Factual Teaching (Cognitive Domain)

Factual teaching provides detailed information about a subject. For example, when preparing a patient for surgery, you should tell the patient what will happen during the surgery, when it will happen, and why the procedure is necessary. Factual information provided to a patient before surgery can also include restrictions on diet or activity that may be necessary both before and after surgery. Factual information is usually supported with written materials so that the patient can refer to the information as needed at a later date.

Sensory Teaching (Affective Domain)

Sensory teaching provides patients with a description of the physical sensations they may have as part of the learning or the procedure involved. This learning relates to how the person is affected—that is, the affective domain. For example, prior to surgery you might need to explain how much pain or what other sensations, such as numbness or tingling, the patient may feel. All five senses may be involved: feeling, seeing, hearing, tasting, and smelling.

Participatory Teaching (Psychomotor Domain)

Participatory teaching includes demonstrations of techniques that may be necessary to show that something has been learned. For example, as part of preoperative teaching, aspects of postoperative care include cleaning the wound, changing the dressing, and applying ice packs. A new diabetic might need to be taught how to check his blood sugar. During this phase of teaching, you need to first describe the technique to the patient and then demonstrate it. By demonstrating the procedure, you are **modeling** it for the patient, or showing the

patient exactly what to do. Then you should ask the patient to perform the same procedure while you watch. This practice is called **return demonstration**. The return demonstration has two purposes. First, it allows you to be sure the patient fully understands the procedure. Second, by actually performing the procedure, the patient uses motor skills and engages the psychomotor domain. Physically performing the procedure helps cement the steps in the patient's mind.

Verifying Patient Understanding

The key to the success of any educational process is verifying that patients have actually understood the information. A good way to check for understanding is to have patients explain in their own words what they have learned. This is a form of feedback. In addition, have them engage in return demonstrations.

Cultural and Educational Barriers

Some practices serve patients who cannot read well or who do not speak or understand English. It may be necessary to create educational materials written in very simple terms that present information through pictures and charts. The information also may need to be translated into one or more languages. Patients must understand the office's policies and procedures as well as any other educational information provided.

One-on-one explanations may be required for these patients. However, printed materials should still be given to these patients to take home for reference. Family members or friends may be able to read the materials for them, reinforcing what they learned in the office. When demonstrating a procedure to patients, keep in mind any physical limitations they have and adjust the procedure accordingly. Make sure patients understand the instructions by asking them to perform the procedure for you.

It is important to match the learning materials to the patient's needs and to her level of understanding. Consider the patient's cultural background, age, medical condition, emotional state, learning style, educational background, disabilities, religious background, and readiness to learn when providing new materials. Review the *Points on Practice: Respecting Patients' Cultural Beliefs*. Keep in mind that patients can refuse treatment and information. If they do, notify the doctor and document the event in the patient's chart.

POINTS ON PRACTICE

Respecting Patients' Cultural Beliefs

Patients come from many diverse cultures and have different beliefs about the causes and treatments of illness. These differences may affect their treatment expectations, as well as their willingness to follow medical directions. Consider these simple steps when giving instructions to patients of diverse cultures:

- Speak slowly and clearly.
- Request or provide a translator as needed.
- Ask for and look for feedback from the patient, indicating that she understands and intends to follow the patient instructions.
- Ask the patient if there is any reason that she will not be able to follow the instructions.
- Address any concerns indicated by the patient, notifying the doctor if the concerns mean that the patient is not likely to follow the instructions.

► Patient Education Materials

LO 15.4

Patient education materials inform patients and enable and encourage them to become involved in their own medical care. Most formal types of patient education involve some printed information. They may also include visual materials, such as DVDs and Internet sites.

Printed Materials

Printed educational materials come in a variety of formats. They can be as simple as a single sheet of paper, or they can be several sheets folded or stapled together to form a booklet.

Brochures, Booklets, and Fact Sheets Many medical offices have materials available that explain procedures performed in the medical office or give information about

specific diseases and medical conditions. For example, women who have had a cesarean section delivery may be given a fact sheet describing simple exercises they can do in bed to help regain strength in the abdominal muscles. Many educational aids are prepared by pharmaceutical companies and are provided free of charge to medical offices. Others may be written by the licensed practitioner or members of the office staff. You may be asked to help prepare some of these materials.

Electronic health record systems provide the ability to create or import informational materials for patients. Using the electronic health record system Practice Fusion®, you can quickly click a link to find up-to-date electronic information on the Internet for any diagnosis or medication you enter into the system. See Figures 15-2 and 15-3 as well as Procedure 15-1, Creating Electronic Patient Instructions, at the end of this chapter.

Whenever written materials of any kind are given to a patient, it must be noted in the patient's chart. Be sure to document exactly which brochure or leaflet was distributed. Using electronic health records, you can create and document patient receipt of pertinent information quickly and easily.

Educational Newsletters A popular patient education tool is the medical office newsletter. Newsletters contain timely, practical healthcare tips. Regular newsletters can also offer

updates on office policies, information about new diagnostic tests or equipment, and news about the office staff. Newsletters are often written by the doctor or office staff. Some publishing companies and medical groups also offer newsletters that can be customized to a particular practice, using the Internet or software programs such as Microsoft® Publisher. See Figure 15-4.

Community-Assistance Directory Patients often require the assistance of health-related organizations within the community. For example, an elderly patient may need the services of a visiting nurse or a Meals on Wheels food program. Other patients may need the services of a day-care center, speech therapist, or weight clinic.

There are many community resources available in your local area that provide needed services to patients. The medical assistant should be aware of these resources and be able to navigate patients to them. The first step is to develop a community resource library by gathering a listing of local agencies. You will need the correct name, address, web address, phone number, contact person, and directions for submitting a referral for each resource listed. It may take some research on your part to locate and organize this information. Contact the community resources and request information such as brochures, newsletters, and referral applications. See

The screenshot displays the Practice Fusion patient record for Sylvia Gonzales, a 51-year-old female born on 09/01/1963. The record is viewed from the 'Summary' tab. On the left sidebar, the 'Diagnoses' section is expanded, showing 'Chronic diagnoses' and 'Acute diagnoses'. The 'Acute diagnoses' list includes '(250.00) Diabetes mellitus Start: 12/31/14'. The 'Medication' tab is selected, showing 'Januvia 100 MG Oral Tablet'. The 'Resources' section is highlighted with a red box, listing 'MedlinePlus' and 'Patient education materials'. The 'Medication' form includes fields for 'START DATE' (12/31/2014), 'STOP DATE' (Today), and a 'MEDICATION COMMENT' (Newly diagnosed, needs plain language educational materials).

FIGURE 15-2 When you add a medication or diagnosis for a patient in Practice Fusion®, a Resources area appears with patient education materials.

GO

Summary

Diabetes means your blood glucose, or blood sugar, levels are too high. With type 2 diabetes, the more common type, your body does not make or use insulin well. Insulin is a hormone that helps glucose get into your cells to give them energy. Without insulin, too much glucose stays in your blood. Over time, high blood glucose can lead to serious problems with your heart, eyes, kidneys, nerves, and gums and teeth.

You have a higher risk of type 2 diabetes if you are older, obese, have a family history of diabetes, or do not exercise. Having prediabetes also increases your risk. Prediabetes means that your blood sugar is higher than normal but not high enough to be called diabetes.

The symptoms of type 2 diabetes appear slowly. Some people do not notice symptoms at all. The symptoms can include

- Being very thirsty
- Urinating often

Procedure 15-2, Identifying Community Resources, at the end of this chapter. Type up an inventory sheet or spreadsheet of your resources, and make sure that all appropriate departments have a copy. A filing drawer can be used to organize and maintain the informational material regarding each resource. A complete and up-to-date community resources directory prepared by the office that is accessible to staff and patients is a valuable aid for referring patients to appropriate agencies. The medical assistant provides good customer service when

they can navigate and assist in the goal of patient health and well-being using this directory.

Visual Materials

Many patients are better able to comprehend complicated medical information when it is presented in a visual format. When using visual educational materials, it is usually best to provide corresponding written materials that patients can keep for reference.

BWW Wire

Our e-newsletter is your guide to current health news, practitioner-written articles, and upcoming events for BWW Medical Associates.

BWW Staff Profile

New Year, New Electronic Health Records for All!

Over the past year, the staff of BWW prepared for the transition to a new electronic health record system. On January 1, 2015, all of our pre-existing files were officially integrated with our new Practice Fusion® EHR, and we have started primarily using electronic health records. We are excited to be able to continue to offer you the very best possible care utilizing this new system. We hope you will be patient with us as our staff get accustomed to using the new system. By January 2016, we are planning to have a patient portal system that will allow you—the patient—to access your medical records from the comfort of your home computer and to more easily request the release of your records to specialists and other providers.

Crunch Camp Challenge

Ring in the New Year with the BWW staff as we challenge ourselves to eat healthier and exercise more. In the reception area, you'll be able to see a graph of our progress as we compete for the title of Crunch Challenge Champion and a new Vitamix blender.

Right now, Miguel is in the lead. With his marathon training regimen, he is logging an impressive number of exercise hours. Newcomer Marissa, however, is dominating the healthy eating component of the competition with her impressively varied and nutritious diet. You can log your own hours on our Crunch Camp app or at BWWAssociates.com to see if you can beat your favorite member of the BWW staff and win yourself a Vitamix blender.

Meet Marissa T. Wang, NP and Andrew V. Utkin, PA

Starting in the New Year, BWW is happy to welcome Mrs. Wang and Mr. Utkin to our practice. Marissa started her career as a healthcare provider in the inner city, where she was a trauma nurse, before she decided to volunteer her time for a year with Doctors without Borders. She met her husband, a pharmacist, in south Sudan. Mrs. Wang just became a Nurse Practitioner, and she and her husband are expecting their first child this summer. Andrew will be splitting his time between BWW and a local non-profit clinic. Born to Ukrainian parents, Andrew spent his formative years abroad before moving to the United States for high school. He decided to enter the medical field after seeing the effects of war and the shortage of quality public healthcare.

Happy Anniversary, Dr. Buckwalter

For the past 30 years, ever since he founded BWW Medical Associates, Dr. Buckwalter has called Port Snead his home. By founding his practice, Dr. Buckwalter brought quality medical care to this underserved waterfront community. A leading citizen, Dr. Buckwalter is known for his active involvement in local government and his Scottish Terrier Jamie. Dr. Buckwalter will be retiring from practice at the end of 2015; however, we plan to make his last year one to remember!

BWW Medical Associates, PC

305 Main Street, Port Snead YZ 12345-9876, Tel: 555-654-3210, Fax: 555-987-6543, Web: BWWAssociates.com

FIGURE 15-4 Practice newsletters are a great tool for patient education. They also keep patients up-to-date on practice events and advances.

© Stockbyte/PunchStock RF; © Stockbyte/PunchStock RF; © image100/PunchStock RF

DVDs DVDs are often used to educate patients about a variety of topics and to instruct them in self-care techniques. The use of DVDs is especially effective when teaching about complex subjects and procedures. Examples of helpful DVDs used in patient education include those on breast self-examination, dressing change, and infant care.

Seminars and Classes Many physicians conduct or arrange educational seminars or classes for their patients. For example, an obstetrician might offer classes in childbirth preparation for patients and their partners. Other seminars and classes may be conducted depending on the type of medical practice.

Libraries and Patient Resource Rooms Most public libraries have an assortment of books, magazines, and electronic databases pertaining to health and medical topics. Hospitals may provide patient resource rooms, which include a variety of educational materials—such as books, brochures, and DVDs—for public use. Some hospitals provide patient education materials on demand through televisions in patient rooms. A medical librarian is a healthcare team member and, if available, a good contact to assist you with obtaining and providing patient education materials.

Associations Thousands of health organizations and associations can be contacted for information about preventive healthcare and virtually every known disease or disorder. The names, addresses, telephone numbers, and websites of these organizations are provided in several directories, which are available online or at most libraries. Table 15-1 provides a sample list of patient resource organizations. Search the Internet to obtain the latest contact information for each organization.

Online Health Information The Internet is a widely used source of medical information. It will be helpful to suggest specific, reputable websites for patients to research. Website addresses should be checked for credibility before using them or referring your patients to them. See Procedure 15-3, Locating Credible Patient Education Information on the Internet, at the end of this chapter. You may need to obtain assistance and approval from the licensed practitioner, a medical librarian, or other medical staff members. Developing a list of reputable sites to suggest to patients as part of patient education is a must. After you have established the list, check the websites about every 6 months to be sure they are still active.

Once you are comfortable with the types of learning and teaching as well as the educational materials available, you should be ready to start patient education. Begin by creating a patient education plan. This plan includes identifying the education needs of the patient, creating an outline, collecting resources for teaching, carrying out the teaching, and then evaluating the effectiveness. Keep in mind that education is an ongoing process. However, the patient education plan gives you a place to start. See Procedure 15-4, Developing a Patient Education Plan, at the end of this chapter.

► Promoting Health and Wellness Through Education

LO 15.5

Maintaining or improving your health is the best way to protect yourself against disease and illness. It is also part of being a good role model in your position as a medical assistant. **Consumer education** is geared toward the average person. It is provided in clear, everyday (nonmedical) language to help Americans become more aware of the importance of good health. As a result, many people are beginning to take greater responsibility for their own health and well-being.

There are many ways to achieve good health. You can develop healthy habits, take steps to protect yourself from injury, and take preventive measures to decrease the risk of disease or illness. Patient education in the medical office should help patients achieve these goals.

Healthy Habits

Patient education can be used to promote good health habits by teaching patients the importance of

- Good nutrition, including limiting fat intake and eating an adequate amount of fruits, vegetables, and fiber.
- Regular exercise.
- Adequate rest (7 to 8 hours of sleep a night).
- Avoiding smoking and drug use.
- Limiting alcohol consumption.

- Safe-sex practices.
- A balanced lifestyle of work and leisure activities (moderation).
- Safety practices.

Whenever possible, these guidelines should be recommended to patients of all ages. Good health should be a top priority in life. Although it is best to adopt healthy behavior before illness develops, remind patients that it is never too late to work toward improving their health.

Protection from Injury

Many accidents happen because people fail to see potential risks and do not develop plans of action. Following safety measures at home, at work, at play, and while traveling can help prevent injury. A discussion of ways to avoid accidents and injury should be part of the educational process. See the *Educating the Patient* feature Tips for Preventing Injury to help patients avoid injury at home and at work.

Another essential aspect of educating patients about injury prevention is teaching them about the proper use of medications. A prescription includes specific instructions for taking the medication. Emphasize to the patient that these instructions must be followed exactly. In addition, the patient must not change the dosage or mix medications of any kind without first checking with the physician. Patients who do not adhere to these rules run the risk of potentially dangerous side effects. Tell patients to report to the physician any unusual reactions experienced when taking medications. Patients also must be cautioned to never share their medications with anyone else, no matter how tempting it may be to “help” a family member or friend.

When providing a patient with a new prescription, always ask the patient if he has told the doctor about all the medications he is already taking, including herbs, vitamins, and over-the-counter (OTC) medications. If the patient tells you that he has not, immediately inform the physician before the patient leaves the office. Some medications taken together or with

EDUCATING THE PATIENT

Tips for Preventing Injury

To avoid accidents and injury, teach patients to use common sense and follow these guidelines.

At Home

- Install smoke detectors, carbon monoxide detectors, and fire extinguishers.
- Keep all medicines, chemicals, and household cleaning solutions out of the reach of children.
- Purchase products in childproof containers. Lock or attach childproof latches to all cabinets, medicine chests, and drawers that contain poisonous items.
- Keep chemicals in their original containers and store them out of children’s reach.
- Install adequate lighting in rooms and hallways.
- Install railings on stairs.
- Use nonskid backing on rugs to help prevent falls, or remove rugs altogether.
- Stay with young children when they are in the bathroom.
- Do not rely on bath seats or rings as a safety device for babies and children.
- Set the water temperature on the water heater at 120° F.
- Never use appliances in the bathtub or near a sink filled with water.
- Practice good kitchen safety: Store knives and kitchen tools properly. Unplug small appliances when not in use. Wipe up spills immediately.
- When cooking, turn all handles of pots and pans inward, toward the cooking surface, to avoid spills and burns.

- Use twist-ties to shorten long electrical cords and speaker wires, or secure them with electrical tape. Avoid plugging too many electrical appliances into the same outlet.
- Exercise caution when using electrical appliances. Use outlet covers when outlets are not in use.
- To reach high places, use proper equipment, such as stepladders, not chairs.
- Use child safety gates at the top of stairwells.

At Work

- Use appropriate safety equipment and protective gear, as required.
- Lift heavy objects properly: Bend at the knees, not at the waist. As you straighten your legs, bring the object close to your body quickly. That way, strong leg muscles do the lifting, not weaker back muscles.
- Never attempt to move furniture on your own. Request that a member of the office building maintenance staff be engaged to do so.
- Use surge protectors on computer and other electronic equipment to prevent overloading outlets.
- Make sure hallways, entrance areas, work areas, offices, and parking lots are well lit.
- If your job involves desk work, practice proper posture when sitting. Do not sit for long periods of time. Get up and stretch, or walk down the hall and back.

certain foods can interfere with how well the drug works or cause side effects or adverse reactions. The physician needs to know about all drugs as well as herbal preparations and OTC medications the patient is taking.

Preventive Measures

Preventive healthcare is an area in which patient education plays a vital role. Patients need to know that they can decrease their chances of getting certain illnesses and diseases by taking preventive measures and avoiding certain behaviors. Preventive techniques can be described on three levels: *health-promoting behaviors, screening, and rehabilitation.*

Health-Promoting Behaviors The first level of disease and illness prevention is to form habits that lower the risk of illness or injury. Examples of these habits are given in the Healthy Habits section of this chapter. Health-promoting behaviors also include understanding the symptoms and warning signs of disease. When these signs are recognized early in the disease process, the disease can often be treated more easily and sometimes even avoided altogether.

Screening The second level of disease prevention is screening. **Screening** involves the diagnostic testing of a patient who is typically free of symptoms. Screening allows early diagnosis and treatment of certain diseases. Examples of screening tests include colonoscopy, mammography, and Pap smears for women and prostate examinations for men.

Annual screening is important to health maintenance. Although the requirements differ according to the age and condition of the patient, annual screenings usually include routine blood work, urinalysis, electrocardiogram (ECG), and a physical examination (PE).

Rehabilitation The third level of disease prevention involves the rehabilitation and management of an existing illness. At this level the disease process remains stable, but the body will probably not heal any further. The objective is to maintain functionality and avoid further disability. Examples of this level of prevention include stroke rehabilitation programs, cardiac rehabilitation, and pain management for conditions such as arthritis.

▶ The Patient Information Packet LO 15.6

When patients come to the medical practice, they need to learn not only about health and medical issues but also about the medical office itself. The patient information packet explains the medical practice and its policies. Unlike most other patient education materials, the patient information packet deals mainly with administrative matters rather than medical issues.

The patient information packet may be as simple as a one-page brochure or pamphlet. It may be a multipage brochure or a folder with multiple-page inserts. In some practices, the patient information packet is available online or through the EHR system for review or printing. See Figure 15-5.

Benefits of the Information Packet

The patient information packet is a simple, effective, and inexpensive way to improve the relationship between the office and the patients. It provides important information about the practice and the office staff. This information helps patients feel more comfortable with the qualifications of the healthcare professionals involved in their care. The packet may help clarify the roles that each office staff member has in patient care.

The information packet also informs patients of office policies and procedures. Patients will learn the doctor's office hours, how to schedule appointments, the office's payment policies, and other administrative details. This information helps limit misunderstandings about these procedures.

The patient information packet also benefits the office staff. It is both an excellent marketing tool and an aid to running the office more smoothly. Providing patients with a prepared information packet saves staff time by answering a number of potential patient inquiries. The information packet is also a good way to acquaint new office staff members with office policies.

Contents of the Information Packet Regardless of the material the information packet contains, it must be written in clear language so that patients are able to read and understand it. All materials should be written at a sixth-grade reading level to accommodate the greatest number of patients. Information should not be presented in a technical medical style. Because you may be responsible for developing portions of the information packet, you should be familiar with the contents of a typical packet.

Introduction to the Office A brief introduction welcomes the patient to the office. It may be helpful to summarize the office's philosophy of patient care. The office's **philosophy** means the system of values and principles the office has adopted in its everyday practices.

Physician's Qualifications The packet commonly includes information about the physician's professional qualifications, including where he received his medical degree and any medical specialties. It usually lists his credentials, such as board certification, and membership in professional associations. For a group practice, the information packet may contain a paragraph or a page for each physician. It may also include the qualifications of physician assistants or nurse practitioners who work in the physician's office. See Figure 15-6.

Description of the Practice The information packet should include a brief description of the practice, particularly if it is a specialty practice. Explaining the types of examinations or procedures that are commonly performed in the office as well as a list of any special services the office provides, such as physical examinations for employment, workers' compensation cases, or other occupational services, would be helpful. Be sure to make medical terms and specialties clear

BWW Medical Associates, PC

NEW PATIENT INFORMATION PACKET

PATIENT NAME: _____

DATE & TIME OF APPOINTMENT: _____

PHYSICIAN NAME: _____

Welcome to BWW Medical Associates, PC. Thank you for choosing us to assist in your healthcare needs. We have included the following information in this packet:

- ☐ Letter of Introduction
- ☐ Map to provide directions to our clinic
- ☐ Description of our practice, staff, and office policies

Below you will find a checklist of information to complete prior to your appointment in our office. Please fill out the entire packet and bring it in with you on your initial visit or complete it online at www.BWWAssociates.com prior to your appointment.

- ☐ Medical history forms
- ☐ Patient information sheet
- ☐ An authorization for release of medical information
- ☐ HIPAA forms
- ☐ Please bring all medications that you are currently taking to this appointment
- ☐ Please bring your insurance card(s) and a photo ID so we may make copies for your chart
- ☐ Please bring all radiology procedures on a CD or film to your appointment
(CTs, PET Scan, MRIs, X-rays, etc.)

It is our desire to make your visit to BWW Medical Associates, PC as pleasant as possible. Should you have any questions, please do not hesitate to contact us at 555-654-3210 or by e-mail at patientrelations@bwwassociates.com.

FIGURE 15-5 Every clinic should have its own patient information packet for new patient orientation.

by avoiding the use of initials. Spell out everything the first time the reference is made and place the appropriate initials in parentheses.

Introduction to the Office Staff Many patients are not familiar with the qualifications and duties of the various members of the office staff. It is a good idea, therefore, to identify the staff positions according to their responsibilities and duties. Patients need to understand that some duties commonly thought to be a nurse's responsibilities may also be performed by a medical assistant. It may be helpful to include the professional credentials and licenses of key staff members.

Office Hours This section should list the days and hours the office is open, including holidays. In addition, patients need to know what to do if an emergency occurs outside regular office hours. Tell the patient what number to call first (for example, the answering service, 911, or the hospital emergency room) and what to do next. Include the telephone number and address of the emergency room at the hospital with which the doctor is affiliated. Assure patients that the doctor or a physician partner can be reached at all times through the answering service. Some practices have multiple offices, and the physicians rotate from office to office on a regular schedule. List all office addresses and phone numbers, along with directions to all office sites.

BWW Medical Associates, PC

Alexis N. Whalen, MD

Dr. Whalen's Qualifications:

- Former Staff Pediatrician at Seattle Children's Hospital
- Board Certified OB/GYN and Pediatrician
- Residency in Family Medicine: Loyola University Chicago, Stritch School of Medicine, Chicago, IL
- Fellowship in Obstetrics & Gynecology: Stanford University, Stanford, CA
- Fellowship in Pediatrics: Seattle Children's Hospital, Seattle, WA

Dr. Whalen is a recognized expert in pediatric medicine, obstetrics, and gynecology.

Raised in Topeka, KS, Dr. Whalen completed her undergraduate studies at The University of Kansas, where she graduated first in her biochemistry class while also majoring in opera performance.

After graduation, she spent two years touring with an off-Broadway opera troop before starting medical school at Loyola University Chicago, where she went on to complete her residency in Family Medicine. During her residency, Dr. Whalen's talents for pediatrics, obstetrics, and gynecology shone, allowing her to acquire two competitive fellowships at the top research centers of Stanford and Seattle Children's Hospital.

A very well-received research study on Pediatric Cardiomyopathy earned Dr. Whalen a spot as a staff pediatrician at Seattle Children's Hospital.

While Dr. Whalen enjoyed the hustle and bustle of working at a major research hospital and the mild climate of Seattle, she and her husband decided to move back to his hometown of Port Snead five years ago.

Dr. Whalen enjoys long waterfront walks with her border collie Scout and her twin daughters Leslie and Lenore.

FIGURE 15-6 Healthcare personnel are the face of any medical practice. Providing patients with credentialing information as well as some personal information will help put new patients at ease.

© Chris Ryan/agefotostock RF

Appointment Scheduling This section of the packet should explain the procedure for scheduling and canceling appointments. You might suggest that patients can benefit by scheduling routine checkups and visits as far in advance as possible. Also note if certain times of the day are reserved for sudden or unexpected office visits.

In this section, encourage patients to be on time for appointments. Explain the problems that result from late or broken appointments. If the office charges a fee for breaking an appointment without advance notice, mention it here. Be

careful to address these sensitive areas with a positive, non-threatening tone. The office's written material should simply state the office policies and the problems that can result when the policies are not followed.

Telephone Policy Providing the office's telephone policies in the information packet can help reduce the number of unnecessary calls to the office and thus save time for the office staff. Explain which procedures can be handled over the telephone and which cannot. Explain procedures

such as calling in for prescription renewals or laboratory test results. If the physician returns patients' calls at a certain time of day, mention that policy in this section. Some practices bill patients for telephone calls in which medical advice is given but not for follow-up calls. For example, if a parent of a child who was vomiting uncontrollably called the physician to get immediate medical advice, the call might be billed. If the physician called to inform a patient of test results, however, the call would not be billed. It is important that patients know about these policies, particularly because many insurance plans do not cover charges for medical advice given over the phone, so the patient will be responsible for these charges.

Some offices (particularly pediatric offices) schedule a certain time of the day for patients (or parents and guardians) to call the physician for answers to their questions. This type of policy benefits both the office and the patients. The patients (or parents) have the assurance that they can speak with the physician about their concerns, and the office is spared interruptions during other times of the day.

Payment Policies Inform patients of the office's policies regarding payment and billing. State whether payment is expected at the time of a visit or whether the patient can be billed. List accepted forms of payment (for example, cash, personal checks, and credit cards). It is not common practice to mention specific fees in an information packet.

Insurance Policies List the major insurance carriers accepted by your office, or state that "most major insurance plans are accepted." Advise patients to bring proof of insurance coverage and a picture ID if this is their first visit to the office. A copy of this ID should be made and inserted in the patient's medical chart. State whether the office submits insurance claim forms directly to the insurance company or whether the patient has this responsibility. Generally, there is no charge for submission of the first insurance claim form; however, if the office charges for submission of secondary insurance forms, this should be stated. Outline the practice's policy for handling Medicare coverage, including whether the office accepts assignment on Medicare claims. If the office does not submit insurance claims directly, explain that the staff will help patients fill out insurance forms when necessary and will provide the appropriate paperwork (usually a superbill) containing dates of service and procedure and diagnosis codes for attachment to the claim form.

Patient Confidentiality Statement The information packet must include a copy of the office privacy policy. Complete information regarding the privacy policy and HIPAA regulations can be found in the *Legal and Ethical Issues* chapter. An important first step of HIPAA compliance is informing the patient of his or her rights. These rights are communicated through the Notice of Privacy Practices (NPP) (discussed in the *Legal and Ethical Issues* chapter), which must adhere to certain specifications.

The information packet also must state that no information from patient files will be released without a signed authorization from the patient. Each patient who receives a copy of the privacy notice must sign a document stating that he received the privacy notice and had the opportunity to have his questions about the notice answered. This document should remain in the patient's medical file.

Other Information The patient information packet may include the practice's policy on referrals. It may provide information about access to available community health resources or agencies. It also may include special instructions for common office procedures (for example, whether the patient needs to fast before a procedure or to avoid certain foods).

Distributing the Information Packet

For the information packet to be effective, you must make sure that new patients receive and read it. One way is to hand the packet to new patients at the time of their first office visit and briefly review the contents with them. Explain that they can find answers to many questions in the packet. Encourage patients to take the packet home, read the information, and keep it handy for future reference, but be sure to obtain the signed documentation that the patient has received and read the privacy notice for your files.

In many cases, the physician's office maintains a website where patients can view the information packet, make an appointment to see the physician, and get a map or directions to the office. The website may also allow patients to complete patient registration and consent for treatment forms online or download the forms, complete them by hand, and bring them to the office on the day of their appointment (Figure 15-7). Patients without Internet access may request to receive this information by mail, or they may be asked to arrive early for their appointment to complete the necessary forms.

► Patient Education Prior to Surgery

LO 15.7

When a patient undergoes a surgical procedure, patient education is vital to a successful outcome. Although exact instructions vary according to the procedure, their purpose is to prepare the patient for the procedure and to aid the patient during the recovery period.

Providing Patient Education

Patients must receive information from the licensed practitioner (*not* the medical assistant) about the need for surgery and its nature. Educating and preparing patients for surgery may be your responsibility. You should provide support and explanations to patients. You must verify that they understand any information they have been given by other members of the healthcare team. Preoperative instruction may include discussion of postoperative care issues, such as temporary dietary restrictions or surgical wound care.

Consent for Treatment

I voluntarily give my permission to the healthcare providers of BWW Medical Associates, PC and such assistants and other healthcare providers as they may deem necessary to provide medical services to me. I understand that by signing this form, I am authorizing them to treat me for as long as I seek care from BWW Medical Associates, PC or until I withdraw my consent in writing.

Signature of Patient or Guardian

Date

Printed Name of Patient or Guardian

Relationship to Patient

Statement of Financial Responsibility/Assignment of Benefits

I acknowledge that I am legally responsible for all charges in connection with the medical care and treatment provided by BWW Medical Associates, PC and Associates. I assign and authorize payments to BWW Medical Associates, PC. I understand my insurance carrier may not approve or reimburse my medical services in full due to usual and customary rates, benefit exclusions, coverage limits, lack of authorization, or medical necessity. I understand I am responsible for fees not paid in full, co-payments, and policy deductibles and co-insurance except where my liability is limited by contract or State or Federal law.

Signature of Patient or Guardian

Date

Printed Name of Patient or Guardian

Relationship to Patient

A duplicate or faxed copy of this form is considered the same as the original document.

FIGURE 15-7 Sample patient consent for treatment form.

Determining whether patients have all the information they need before surgery is essential from both an educational and a legal standpoint. All patients who are undergoing a surgical procedure must first sign an informed consent form. This legal document provides specific information about the surgical procedure, including its purpose, the possible risks, and the expected outcome. The medical assistant may be asked to witness the patient's signature on this form. The signed informed consent form, along with documentation of all preoperative instructions, must be put in the patient's chart. (See Figure 15-8.)

Preoperative Education

Preoperative education increases patients' overall satisfaction with their care. It helps reduce patient anxiety and fear, use of

pain medication, complications following surgery, and recovery time. Letting the patient know what to expect during the surgery and afterward allows the patient to emotionally educate himself about the surgical procedure. The use of effective teaching techniques is essential to ensure patient understanding. Make sure the patient has a patient instruction sheet and can repeat the expectations back to you.

It may be difficult for a patient to visualize exactly what will take place in some surgical procedures. For example, think of arthroscopy of the knee. When told that the doctor will insert a viewing instrument into the knee, patients probably have no idea of the size of this scope. As a result, they may be particularly fearful of the procedure. An anatomical model, diagram, or photo is useful to show exactly what will happen and ease patients' fears. For example, an anatomical

Patient Surgical Consent Form

Your surgeon for this procedure is: _____

I hereby authorize and request the surgeon, along with any assistants he/she feels are necessary, to perform upon me the following operation(s):

I understand that the nature and purpose of the above mentioned procedure(s) is/are to:

I also authorize the surgeon to do any therapeutic procedure or investigation that in his/her judgment may be advisable for my well-being.

The nature of the planned operation has been thoroughly explained to me by my surgeon and I have decided to proceed with this form of therapy over other alternative methods. The risks, benefits, and alternatives, including doing nothing, have been explained to me. I understand that the practice of medicine and surgery is not an exact science and I acknowledge that no guarantees have been made about the results of the operation or procedure planned. Furthermore, the risks and complications inherent in the operation have been explained to me and I accept these.

I further give permission to have such anesthetics administered to me as the surgeon or the anesthetist deems necessary or advisable.

Pictures may be taken of the treatment site for record purposes. I understand that these photographs/videos will be the property of the attending physician.

- ☐ I DO agree to allow these pictures to be used for publication or teaching purposes.
☐ I DO NOT agree to allow these pictures to be used for publication or teaching purposes.

If I agree, I understand that my name and identity will be kept confidential and protected.

I agree to keep the office of the surgeon informed of my postoperative progress and I agree to cooperate with instructions given for my postoperative care.

Patient or Legal Guardian (Signature) _____

model may help a patient who is having surgery on his ear see how the surgical procedure will help correct his problem. (See Figure 15-9.)

Helping Relieve Patient Anxiety

When you provide preoperative education, be aware that the fear and anxiety of patients who are about to undergo a surgical procedure can adversely affect the learning process.

Consequently, allow extra time for repetition and reinforcement of material.

Always consider your choice of words carefully, stressing the positive rather than the negative whenever possible. Involving family members in the educational process is often beneficial, particularly if the patient is especially apprehensive about the surgery. Provide patients with contact information in case they have additional questions after they leave.

FIGURE 15-9 An anatomical model can help patients visualize what will happen during surgery.

© McGraw-Hill Education/David Moyer, photographer

Present your instructions and explanations in straightforward language that they can understand. Remember to be reassuring but to not promise a specific result for which the physician may be held liable if the expected result is not the actual result. Remember to verify that they understand everything. This will also help to reduce their anxiety level. Procedure 15-5 will guide you through the process of outpatient surgery teaching.

PROCEDURE 15-1 Creating Electronic Patient Instructions

Procedure Goal: To create and administer patient instructions electronically

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: An electronic health records software program that includes a patient instructions feature

Method:

1. Search the EHR to find the button or icon to create patient instructions. (Check the Help button or review the training manual.)
2. Determine if you will need to write your own or can select from a previously created list of patient instructions. Select the correct button to proceed.
3. Create new instructions by either of the following methods:
 - a. Type your patient instructions directly in the open window or a word processing program. This will depend on the EHR you are using. In some cases, you may need to just click a link to go directly to previously created patient instructions.
 - b. When you are within a web browser, navigate to a credible Internet site, such as MedlinePlus, for patient

instruction. If available on the site, select the “printer friendly” version. Highlight the information you want to use from the website, place your cursor at the beginning of the text, and, with your left mouse button depressed, drag the cursor to the end of the instruction page. Right-click on any highlighted area and choose Copy. Click in the patient instruction window or in the word processing program and, using the keypad, press the [Ctrl] and [V] keys. Identify and credit the web location where you obtain the data if they are copyrighted. Close the web page and return to the EHR.

4. Import instructions by opening a previously created document saved as an RTF or other word processing file type. Import the document according to the manufacturer’s instructions.
5. Use existing instructions by selecting them from a list within the EHR or a file folder on your computer. Check the specific directions for the EHR program you are using.
6. Record in the EHR the instructions that you provided to the patient. In most programs this occurs when you generate the instructions and they become a permanent record in the patient’s chart.

PROCEDURE 15-2 Identifying Community Resources

Procedure Goal: To create a list of useful community resources for patient referrals.

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Computer with Internet access, phone directory, printer

Method:

1. Determine the needs of your medical office and formulate a list of community resources. The specific needs of your

patients will help you formulate your list. Being able to help patients find outside assistance when necessary is the goal.

2. Use the Internet to research the names, addresses, web addresses, and phone numbers of local resources such as state and federal agencies, home healthcare agencies, long-term nursing facilities, mental health agencies, and local charities. Use the phone directory to help you locate local agencies such as Meals on Wheels; Alcoholics Anonymous; shelters for abused individuals; hospice care; Easter Seals; Women, Infants, and Children (WIC); and support groups for grief, obesity, and various diseases.
3. Contact each resource and request information such as business cards and brochures. Some agencies may send a representative to meet with you regarding their

services. If patients can access information easily, they are more likely to take advantage of the services available to them.

4. Compile a list of community resources with the proper name, address, phone number, e-mail address, and contact name. Include any information that may be helpful to the office.
5. Update and add to the information often, because outdated information will only frustrate you and your patients, creating even more anxiety.
6. Post the information in a location where it is readily available both in the office and on the practice's website, if available. Maintain an electronic record for easy reference.
7. Navigate patients to community resources when necessary.

PROCEDURE 15-3 Locating Credible Patient Education Information on the Internet

Procedure Goal: To determine the credibility of patient education information on the Internet

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Computer with Internet access

Method:

1. Open your Internet browser and locate a search engine. Search engines vary in the way they search, so you may want to use more than one search engine for different results.
2. Search the topic. Be specific when entering the search term. For example, if you want to know about the proper diet for high cholesterol, you should type "high cholesterol diet." For different or more medical sites, try using different terms; instead of "high cholesterol" try "hyperlipidemia."
3. Select a site from the list of results and evaluate the source.
 - a. Click the "about us" link to find out who developed the site. Sites should have an active link available to contact the webmaster and verify the source.
 - b. Sites developed by professional organizations, educational institutions, or a branch of the federal government are generally better than those developed by an individual or a commercial company.
4. Review the "about us" page to determine the quality of the information.
 - a. Review the mission statement or other detailed information about the developer.
 - b. Look for information about the writers or authors of the site. Make sure they are medical professionals.
5. Check the content of the site.
 - a. Avoid sites that have sensational writing or make claims that are too good to be true.
 - b. Make sure the language of the information is at a level that you can understand. Avoid sites that use lots of technical jargon for patient instruction.
6. Make sure the information is current by checking the copyright or by checking with the contact information on the site. Medical information changes frequently, so check the date and avoid information over 5 years old.
7. Avoid websites that are potentially biased. For example, if the site is written by a pharmaceutical company, the site will only present information about the medication manufactured by that company. There may be alternative medications. Sites written by individuals are interesting but may be biased as well.
8. Protect your privacy. If the sites require you to register, review their privacy policy. They may be able to share your or your patient's information with other companies.
9. Once you have evaluated the site and decide to use it, you may want to have your supervisor or licensed practitioner review and approve the information you will be providing to the patient.

PROCEDURE 15-4 Developing a Patient Education Plan

Procedure Goal: To create and implement a patient teaching plan

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Pen, paper, various educational aids (such as instructional pamphlets and brochures), and/or visual aids (such as posters or DVDs)

Method:

1. Identify the patient's educational needs in order to provide instruction at the patient's point of need. Consider the following:
 - a. The patient's current knowledge
 - b. Any misconceptions the patient may have
 - c. Any obstacles to learning (loss of hearing or vision, limitations of mobility, language barriers, and so on)
 - d. The patient's willingness and readiness to learn (motivation)
 - e. How the patient will use the information
2. Using the various educational aids available, develop and outline a plan that addresses all the patient's needs. Include the following areas in the outline:

- a. What you want to accomplish (your goal)
 - b. How you plan to accomplish it
 - c. How you will determine if the teaching was successful
- RATIONALE:** *Developing an educational plan before providing the education ensures that all patient needs will be addressed.*

3. Write the plan. Try to make the information interesting for the patient.
4. Before carrying out the plan, share it with the licensed practitioner to get approval and suggestions for improvement.
5. Perform the instruction. Be sure to use more than one teaching method. For instance, if written material is being given, be sure to explain or demonstrate the material instead of simply telling the patient to read the educational materials.
6. Document the teaching in the patient's chart for continuity of care and to maintain a legal record.

RATIONALE: *All patient education must be documented in the patient's medical chart for continuity of care and as a legal record.*
7. Revise your plan as necessary to make it even more effective. To be an effective teacher, you must evaluate the methods you use.

PROCEDURE 15-5 Outpatient Surgery Teaching

WORK // DOC

Procedure Goal: To inform a preoperative patient of the necessary guidelines to follow prior to surgery

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Patient chart or progress note, surgical guidelines

Method:

1. Review the patient's chart to determine the type of surgery to be performed, and then ask the patient what procedure is being performed.

RATIONALE: *This confirms the patient's knowledge of the procedure.*
2. Tell the patient that you will be providing both verbal and written instructions that should be followed prior to surgery.
3. Inform the patient about policies regarding makeup, jewelry, contact lenses, wigs, dentures, and so on.
4. Tell the patient to leave money and valuables at home.
5. If applicable, suggest appropriate clothing for the patient to wear for postoperative ease and comfort.
6. Explain the need for someone to drive the patient home following an outpatient surgical procedure.

RATIONALE: *Driving after even simple surgery can be very dangerous. Surgery can be canceled if a patient does not identify a responsible driver before surgery occurs.*

7. Tell the patient the correct time to arrive at the office, surgery center, or hospital for the procedure.
 8. Inform the patient of dietary restrictions. Be sure to use specific, clear instructions about what may or may not be ingested and at what time the patient must abstain from eating or drinking. Also explain these points:
 - a. The reasons for the dietary restrictions
 - b. The possible consequences of not following the dietary restrictions
- RATIONALE:** *Surgery can be canceled if the patient has not followed dietary instructions.*
9. Ask patients who smoke to refrain from or reduce cigarette smoking during at least the 8 hours prior to the procedure. Explain to the patient that reducing smoking improves the level of oxygen in the blood during surgery.
 10. Suggest that the patient shower or bathe the morning of the procedure or the evening before.
 11. Instruct the patient about medications to take or avoid before surgery. For example, patients may need to stop

taking a daily aspirin or vitamin E before surgery to reduce the risk of bleeding.

RATIONALE: *Surgery can be canceled if the patient has not followed medication instructions.*

12. If necessary, clarify any information about which the patient is unclear.

13. Provide written surgical guidelines and suggest that the patient call the office if additional questions arise.

RATIONALE: *Patients may not understand or remember verbal instructions. Written instructions can be taken home and reviewed again.*

14. Document the instructions in the patient's chart for continuity of care and as a legal record. Refer to Progress Note.

RATIONALE: *All patient education must be documented in the patient's medical chart for continuity of care and as a legal record.*

PROGRESS NOTE

Patient Name:

Blythe Williams

Surgical instructions for arthroscopic left knee surgery provided. Dietary, medication, and driving restrictions explained to the patient. Informed consent signed and placed on chart. Patient did not have questions. Written instructions sent home with the patient.

SUMMARY OF LEARNING OUTCOMES	
LEARNING OUTCOMES	KEY POINTS
15.1 Identify the benefits of patient education and the medical assistant's role in providing education.	Patients benefit from patient education because it can help them regain their health and independence more quickly. The medical office also benefits because patients will be less likely to call the office with questions and, therefore, the office staff can spend less time on the telephone. Educated patients take a more active role in their medical care.
15.2 Describe factors that affect learning and teaching.	Learning occurs in three domains: knowledge, behaviors, and skills. The patient must be able to recall the information, have the right attitude and be motivated to learn, and then implement the skills needed to demonstrate that the knowledge is retained.
15.3 Implement teaching techniques.	Teaching methods and formats are adjusted for the best possible result depending on patient need and level of understanding. The best possible education plan comes from knowing your patient and his needs and abilities, as well as the goal of the instruction. Always assess your instruction at its completion and revise the plan as needed.
15.4 Choose reliable patient education materials used in the medical office.	The types of patient education materials in medical offices include brochures, booklets, fact sheets, newsletters, DVDs, Internet sites, and community-assistance directories. Using already completed print or electronic patient instruction sheets, ensuring that Internet sources are credible, and obtaining assistance from other healthcare team members are all methods of ensuring reliability of educational materials.
15.5 Explain how patient education can be used to promote good health habits.	Patient education promotes good health by teaching patients the importance of developing healthy habits such as eating properly and exercising regularly.

LEARNING OUTCOMES

15.6 Describe the types of information that should be included in the patient information packet.

15.7 Describe the benefits and special considerations of patient education prior to surgery.

KEY POINTS

The contents of the patient's information packet should include an introduction to the medical office, the physician's qualifications, a description of the practice, an introduction to the staff, office hours, appointment scheduling, telephone policies, payment and insurance policies, a confidentiality statement, and other pertinent information.

Educating patients prior to surgery is vital to a successful outcome. Patients should learn proper procedures before surgery and sign a surgical consent.

© McGraw-Hill Education

Recall Sylvia Gonzalez from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding her case.

1. What might be important to consider when creating an educational plan for Sylvia?
2. What factors could block effective patient education?
3. Why are good listening skills an important part of teaching?
4. What do you consider behaviors that indicate you are “talking down” or behaving inappropriately to a patient?

E X A M P R E P A R A T I O N Q U E S T I O N S

1. (LO 15.6) A benefit of the patient information packet is that it
 - a. Promotes better compliance with treatment programs
 - b. Helps patients feel more comfortable with the qualifications of the healthcare professionals who are caring for them
 - c. Can answer a treatment question that may come up during an office visit
 - d. Encourages patients to help themselves achieve better health
 - e. Ensures patient compliance
2. (LO 15.3) Which of the following types of teaching gives patients a description of the physical sensations they may have during the procedure?
 - a. Factual
 - b. Sensory
 - c. Participatory
 - d. Modeling
 - e. Media
3. (LO 15.4) Which of the following is the *most* difficult way to create electronic patient instructions?
 - a. Type the instructions directly into the open window
 - b. Import the instructions from the Internet
 - c. Use previously created instructions
 - d. Print the instructions directly from the Internet
 - e. Use preprinted instructions
4. (LO 15.1) Which of the following is the *least* likely patient benefit of patient education?
 - a. Patients are less likely to call the office
 - b. Patients take a more active role in their medical care
 - c. Office staff are not interrupted as often by patient phone calls
 - d. Patients will not need as much medication
 - e. Patients are more likely to understand instructions

5. (LO 15.2) Which of the following is an example of the psychomotor learning domain?
 - a. The patient is willing to read the brochure
 - b. The patient performs his own blood glucose test
 - c. The medical assistant tells the patient how she is going to feel during a procedure
 - d. The medical assistant provides the patient with a patient information package
 - e. The patient searches the Internet for information about his condition
6. (LO 15.4) When checking an Internet site for credibility, which of the following is *least* likely to be necessary?
 - a. Use caution if the site uses a sensational writing style
 - b. Look for the author of the information you plan to use
 - c. Check the date of the document you plan to use
 - d. Click links on the site to make sure they are not broken and are kept up-to-date
 - e. Ensure that the site is listed on at least two search engines
7. (LO 15.6) Which of the following would *least* likely be in the patient information packet?
 - a. Office policies and hours
 - b. Patient instruction sheet regarding common tests done at the practice
 - c. Patient instruction sheet about healthy living
 - d. List of the physicians with their qualifications
 - e. Patient confidentiality statement
8. (LO 15.7) What visual tool is especially helpful when performing preoperative education?
 - a. Anatomical model
 - b. Printed information sheet
 - c. Line drawing
 - d. Class or seminar
 - e. Sensory teaching
9. (LO 15.5) Which of the following is a healthy habit that should be part of patient teaching?
 - a. Getting adequate rest (4 to 5 hours of sleep a night)
 - b. Limiting fruits, vegetables, and fiber
 - c. Using cigarettes in moderation
 - d. Balancing lifestyle of work and leisure activities (moderation)
 - e. Exercising about 15 minutes per day
10. (LO 15.5) Your patient has a history of cardiovascular disease. Which of the following is *least* likely a screening procedure that would be done?
 - a. Blood work
 - b. Colonoscopy
 - c. Chest X-ray
 - d. ECG
 - e. Cardiac rehabilitation

SOFT SKILLS SUCCESS

A 35-year-old male patient is scheduled for a vasectomy tomorrow. It is within your scope of practice to provide preoperative instruction and you feel confident in performing this task. When you introduce yourself and explain what you are going to do, the first words out of the patient's mouth are "How do you know what this is all about? I am the one who is getting things cut!" How would you respond to this patient?

Go to PRACTICE MEDICAL OFFICE and complete
the module Admin: Check Out - Interactions.

Schedule Management

CASE STUDY

PATIENT INFORMATION	Patient Name	DOB	Allergies
	John Miller	12/5/19XX	Bee stings
	Attending	MRN	Other Information
	Paul F. Buckwalter, MD	082-09-981	Hx of compliance issues w/ meds

John Miller is a 65-year-old patient with a history of hypertension, Type 2 diabetes mellitus, history of MI (myocardial infarction) 4 years ago, and a confirmed current diagnosis of CHF (congestive heart failure). He is taking glyburide 2.5 mg daily, Captopril 25 mg twice a day, and HCTZ 25 mg a day. You notice when he arrives today that he is significantly short of breath. When asked, he states, "Have been doing OK until I fell down yesterday. I was carrying a box of stuff

© McGraw-Hill Education

to take to the Salvation Army and lost my footing." He then shows you abrasions of his right elbow and left knee. After his examination, Dr. Buckwalter speaks to Mr. Miller's cardiologist and then asks you to book a cardiac catheterization. Mr. Miller is a Medicare patient, but he is covered under a Medicare (managed care) replacement plan instead of the traditional Medicare plan.

Keep Mr. Miller in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

ACTIVSim

LEARNING OUTCOMES

After completing Chapter 16, you will be able to:

- 16.1** Describe how the appointment book is key to the continuity of patient care.
- 16.2** Identify how to properly apply a matrix to an appointment book.
- 16.3** Compare different types of appointment scheduling systems.
- 16.4** Identify ways to organize and schedule patient appointments.
- 16.5** Model how to handle special scheduling situations.
- 16.6** Explain how to schedule appointments that are outside the medical office.
- 16.7** Implement ways to keep an accurate and efficient practitioner schedule.

KEY TERMS

- | | |
|--------------------------|---------------------------|
| advance scheduling | no-show |
| cluster scheduling | open-hours scheduling |
| double-booking system | overbooking |
| itinerary | time-specified scheduling |
| <i>locum tenens</i> | underbooking |
| matrix | walk-in |
| minutes | wave scheduling |
| modified-wave scheduling | |

- VI.C.1** Identify different types of appointment scheduling methods
- VI.C.2** Identify the advantages and disadvantages of the following appointment systems:
 - (a) manual
 - (b) electronic
- VI.C.3** Identify critical information required for scheduling procedures
- VI.P.1** Manage appointment schedule using established priorities
- VI.P.2** Schedule a patient procedure
- VI.A.1** Display sensitivity when managing appointments

7. Records Management

- b. Utilize Electronic Medical Records (EMR) and Practice Management Systems

8. Administrative Procedures

- d. Apply scheduling principles
 - (1) Schedule of in- and out-patient procedures
 - (2) Admission or hospital procedures

► Introduction

As a medical assistant, you will need to know all aspects of schedule management. This includes how to create and utilize a paper appointment book or an electronic scheduler. Electronic scheduling programs are discussed in the chapter *Electronic Health Records*. Referring back to this chapter may be necessary while learning about schedule management. In this chapter you will learn how to identify the different types of scheduling systems, how each is used, and which type of system will work best for each type of practice. You also will learn how to handle many types of scheduling situations within the medical office, including patient appointments, emergencies, pharmaceutical representatives, and the scheduling of patient appointments with other medical facilities. Legal aspects of the appointment book are discussed and proper documentation is stressed. Additional topics include appointment cards, reminder mailings, reminder calls, and recall notices for patients.

► The Appointment Book

LO 16.1

Time is of great value for everyone involved—the practitioner, the patient, and the office staff. Scheduling appointments in an organized fashion shows respect for everyone's time and creates an efficient patient flow. If the schedule is changed for any reason, the medical assistant must update the appointment book or scheduler and make sure that everyone involved is aware of the change. A well-managed appointment book, regardless of whether it is an actual book or an electronic format within a computer system, is key to patient continuity of care and presents the office in a positive, professional manner, ultimately keeping all parties involved on task and on time.

The office schedule depends on practitioner preferences and habits, the facilities available, and patient need. Although most patients understand that they may have to wait in the reception area before they are seen by his or her provider, few patients are willing to wait more than 20 minutes. Offices that

routinely have long waiting times can find themselves with dissatisfied patients, which can lead to other problems such as losing patients. You may find that patients will get creative in an attempt to avoid waiting. They may deliberately arrive after their scheduled appointment time to avoid waiting. Other patients may come in earlier in hopes of being seen before their scheduled appointment time. Still others may avoid the schedule entirely and walk in, expecting to be seen. All of these behaviors, if accommodated, can throw the office schedule off track. Other patients may become resentful and decide to seek medical care with a competing practice.

Even in a well-run office, however, unexpected events can disrupt the schedule. Some patients may unexpectedly require the provider to spend more time with them than was originally scheduled and patients who are ill will need to be added to the schedule, sometimes with little or no notice. Still others will forget appointments or arrive later than scheduled. For these reasons, making an office schedule flow smoothly can be a challenge. A schedule that “plans for the unexpected” combined with excellent communication between the practitioners, staff, and patients will allow a medical practice to run smoothly despite these obstacles.

Computerized Scheduling

As part of many Practice Management Systems and EHR programs discussed in the *Electronic Health Records* chapter, computerized scheduling systems are becoming more common in medical offices because they have several advantages over handwritten systems (Figure 16-1). As more practices become compliant with electronic health record regulations, the advantages seem to outweigh the disadvantages. The following are some of the advantages of computerized scheduling.

1. It enables locking out selected areas for designated purposes, such as last-minute or emergency visits.
2. It allows information to be accessed from multiple areas within the office.

3. It helps staff identify problem patients for cancellations, no-shows, and late arrivals.
4. It provides a “search” for upcoming appointments to ensure that proper follow-up care is given.
5. It provides reports on overall scheduling practices.
6. It adds color-coding as a visual aid to identify areas designated for certain types of appointments.
7. It allows searches for requested day or time availability.

Online Scheduling

The online scheduling option (e-scheduling) is gaining acceptance, but it is not recommended for all office types. Online scheduling allows patients to schedule themselves or request an appointment via the Internet. Cost and security have been the barriers to many offices; however, new security measures ensure protection of patient data online and as more programs become available, costs are also becoming more reasonable. Adding an online scheduler to the practice takes some time and requires staff training, but it can be a convenience for your patients, particularly if many of them are computer-savvy.

Before adopting an e-scheduler, assess the practice needs, survey patients regarding web access and potential for usage, and be diligent in your research about available products, particularly regarding privacy issues. One of the frontrunners in e-scheduling is Compass Scheduling, found at <http://asp.compasscheduling.com>

Applying the Matrix

LO 16.2

Before you begin scheduling appointments, you need to prepare the appointment book or electronic scheduler. The first step is establishing the **matrix**, or basic outline of times the practitioners are and are not available to see patients. To create the matrix, block off times within the schedule during which each provider is not available to see patients. In a paper format, drawing an “X” through the unavailable time slots with a brief explanation is standard practice to avoid errors. The type of appointment book used—whether it uses 10- or 15-minute units—will determine how many “blocks” are crossed out for each designation. Electronic schedulers often use colors to designate the reason the provider is out; they may also place an “X” in the time frames selected. For example, the schedule will show when the practitioner is away for the following reasons:

- Hospital rounds
- Surgery/procedures
- Lunch
- Vacation days
- Holidays
- Personal appointments for the practitioner
- Scheduled meetings (for example, pharmaceutical company or in-service meetings)

FIGURE 16-1 Screen shot from Practice Fusion® showing a day's schedule of patients, including those who did or did not show for their appointments.

© Practice Fusion®

The day's schedule is then built around the established matrix. Should the provider or office manager direct that a meeting has been canceled and patients should be seen during a time that had been blocked out, the "X" should be removed

and patients scheduled as usual. Some offices prefer the "X" remain and the initials of the person approving the new schedule be added to the appointment time frame. See Figure 16-2 for an example of a matrix for a multi-practitioner office. For

REMARKS & NOTES				

FIGURE 16-2 The first step in appointment scheduling is to establish the matrix—defining when the practitioner is available to see patients.

a single-practitioner schedule with appointments in 15-minute increments, see Figure 16-3.

The same concept is true for the format of an electronic scheduler; if the matrix needs to be changed because the provider

will be available to see patients, the time frame is unblocked and patients are then scheduled as usual. Figure 16-4 provides an example of an electronic scheduler. Procedure 16-1 provides the opportunity to practice completing an appointment matrix using

FIGURE 16-3 Single-practitioner appointment book using 15-minute appointment blocks.

FIGURE 16-4 An example a week's schedule for BWW Medical Associates using the electronic scheduler in Practice Fusion®. Note that gray areas, like the one for the BWW Associates meeting, show times when certain practitioners are unable to see patients.

© Practice Fusion®

an appointment book. Refer to the *Electronic Health Records* chapter and Procedure 12-3 for information on creating an appointment matrix using an electronic scheduling system.

Required Patient Information

When the matrix has been established, you can begin scheduling appointments. Some practices enter the information into both traditional paper appointment books and computerized systems. Then, if the computer fails to work for some reason, the office has the book for reference. Some practitioners who have been in practice for many years are used to the appointment book method and do not want to give it up for a computerized system. Other offices are completely computerized. Per your office policy, you should obtain the following patient information in order to efficiently book a patient appointment regardless of the system used:

- Patient's full name. Obtain the correct spelling of the patient's name.
- Daytime telephone numbers. Repeat phone numbers to ensure accuracy.
- Purpose of the visit. Use a brief description and approved abbreviations when possible without disclosing the patient's diagnosis or violating HIPAA. Do not create your own abbreviations, as this can lead to errors or misunderstandings regarding the reason for the patient appointment.

Abbreviations in Appointment Scheduling

If you are the person who maintains the appointment book, you will find that certain procedures and conditions occur frequently. The use of abbreviations will depend on the office specialty. Only approved universal medical abbreviations should be used. To save space and time when entering information, use the abbreviations found in Table 16-1.

Standard Appointment Times

If you are to schedule appointments efficiently, you must have a guideline of how long visits are expected to take. Working with the provider(s) in your practice, create a list of standard appointment times. Also indicate in the list how much time to allow for tests that are commonly performed in the practice. This list, which should be kept near the appointment book or programmed into the electronic scheduling system, helps you identify which openings are appropriate for the appointment type or procedure involved. This list is intended as a guide only, as each patient visit is unique. The list will also assist you in choosing an appropriate appointment book or scheduler, as most are based on 10-, 15-, or 30-minute increments. The lengths and types of tests and procedures will depend on the practice policy and procedure manual. Table 16-2 lists the typical lengths of common office appointments and procedures.

TABLE 16-1 Common Abbreviations Used in Appointment Scheduling	
Abbreviation	Description
BP	blood pressure check
can/cx	cancellation
CDE or CPE	complete diagnostic exam/complete physical exam
c/o	complains of
cons	consultation
CP	chest pain
ECG/EKG	electrocardiogram
FBS	fasting blood sugar

re	recheck
ref	referral
RS	reschedule
Rx	prescription
Sig	sigmoidoscopy
S/R	suture removal
surg	surgery
US or U/S	ultrasound

TABLE 16-2 Typical Appointment Times for Specific Appointment Types	
Appointment Type or Procedure	Time Frame Allotted
Complete physical examination (existing/new patient)	30 minutes/60 minutes
New patient visit	30–45 minutes
Follow-up appointment	5–15 minutes
Emergency office visit	15–20 minutes
Prenatal examination	15 minutes
Pelvic exam and Pap smear	15–30 minutes
Minor (in-office) surgery (e.g., mole removal)	30 minutes
Suture removal	10–20 minutes

The Appointment Book as a Legal Record

The appointment book is considered a legal record. Some experts advise keeping old appointment books for at least 3 years. Because the appointment book could be used as evidence in legal proceedings, entries must be clear and easy to read. Management consultants suggest that because the appointment book is a legal document, the schedule should be written in ink. In spite of this, many offices that still use the paper method use pencils to record the initial entry. If pencil is used, at the end of each day you should write directly over the penciled entries in ink to create a permanent document.

Never erase a name or use correction fluid to blot the name out. Instead, as with any medical record, draw a single line through the name and beside it write in the reason, such as “NS” or “can.” If space allows, you may also include the date and time of the new appointment (if known) with the notation of “RS” (for rescheduled appointment). Always include your initials after making any change in documentation so that if there are questions in the future, the author of the changes can be contacted. This information also should be documented in the patient’s medical record to track possible compliance issues. (Complete information on patient documentation is found in the *Medical Records and Documentation* chapter.)

Appointment Scheduling Systems LO 16.3

There are several popular appointment scheduling systems. The method chosen usually depends on the type of practice and provider preferences. No matter which method your office uses, it should be regularly reviewed to see whether it is meeting its goals: a smooth flow of patients and minimal waiting time.

Open-Hours Scheduling

In the **open-hours scheduling** system, also known as the walk-in system, there are few (if any) scheduled appointments. Patients arrive at their own convenience with the understanding that they will be seen on a first-come, first-served basis. The only thing that may alter this is an emergency. Depending on how many people have arrived ahead of them, newly arriving patients may have a considerable wait. The open-hours system eliminates the problems caused by broken appointments because there are no assigned appointment times, but it increases the possibility of inefficient downtime for the practitioners and office staff, should there be no patients in the office. In addition to possible long wait times, if paper medical records are used, the medical assistant cannot retrieve patients’ charts before they arrive. Although still used by emergency departments, urgent care centers, and some rural practices, most private practices have replaced this system with scheduled appointments.

Even though appointments are not booked ahead of time with an open-hours system, a matrix must still be established so that the staff will know which practitioners are available to see patients at any given time. Additionally, for legal (as well

as tracking) reasons, an open-hours system still requires the use of an appointment book or electronic scheduling system to record patients as they arrive in the office.

Time-Specified Scheduling

Time-specified scheduling (also called stream scheduling) assumes a steady stream of patients all day long at regular, specified intervals. Once the matrix has been applied and provider availability has been established, it can be determined how many slots or blocks should be used for each appointment type (refer to Table 16-2). Most minor medical problems, such as sore throats, earaches, or blood pressure follow-ups, usually require only 10- to 15-minute appointment slots. More time may be required for appointments such as physical exams, which usually require 60 minutes, or new patient visits, which usually require 30 minutes. When a visit requires more time, you simply assign the patient additional back-to-back slots. Using arrows or parentheses on both sides of the appointment entry will allow you to easily see the length of existing appointments and the remaining open time slots. Refer back to Figure 16-3 for an example of a completed schedule for a single practitioner and Figure 16-4 for a multi-practitioner schedule using an electronic scheduling system.

Wave Scheduling

Wave scheduling gets its name from a “wave” at the beach. Essentially, patients are scheduled to come in “waves,” or together. It works best in larger medical facilities that have enough departments and personnel to provide services to several patients at the same time. This method of scheduling is based on the reality that some patients will arrive late and that others will require more or less time than expected with the practitioner. Wave scheduling has the flexibility to allow for appointments that require more time than anticipated or for patients who miss appointments. The goal is to begin and end each hour with the overall office schedule on track. You determine the number of patients to be seen each hour by dividing the hour by the length of the average visit. If the average is 15 minutes, for example, you schedule four patients for each hour. An example of wave scheduling would be

10:00 a.m.	Mohammad Nassar	555-5683	Sore throat
10:00 a.m.	Shenya Jones	555-7322	Low back pain
10:00 a.m.	John Miller	555-4673	FU B/P
10:00 a.m.	Raja Lautu	555-2854	B12 inj

In this example, all four patients have been given appointments to see the same provider at 10 a.m. The provider will then see each patient in the order in which they arrive in the office, the goal being all four patient appointments completed by 11 a.m., when the next “wave” of four patients is scheduled to arrive. The main problem with wave scheduling is that patients may realize they have appointments at the same time as other patients. The result may be confusion and possibly annoyance or anger.

Modified-Wave Scheduling

The wave system can be modified in several ways. With **modified-wave scheduling**, as shown in Figure 16-5, patients might be scheduled in 15-minute increments. Another option is to schedule four patients to arrive at planned intervals during the first half hour, leaving the second half hour unscheduled. Appointments that are anticipated to require more time should be scheduled at the beginning of the hour. Appointments that are expected to be less time-consuming should be scheduled in 10- to 20-minute time slots. This method allows time for catching up before the next hour begins. An example of modified-wave scheduling would be

10:00 a.m.	Mohammad Nassar	555-5683	Sore throat
10:00 a.m.	Shenya Jones	555-7322	Low back pain
10:15 a.m.	(left open)		
10:30 a.m.	John Miller	555-4673	FU BP
10:30 a.m.	Raja Lautu	555-2854	B12 inj
10:45 a.m.	(left open)		

Double-Booking

With a **double-booking system**, two or more patients are purposely scheduled for the same appointment slot. Unlike the wave or modified-wave system, however, the double-booking system assumes that both patients will actually be seen within the scheduled period.

This type of system is especially useful when one patient can be managed by the nurse practitioner or physician assistant for an immunization or blood pressure check and the other patient is seen at the same time by the physician. Double-booking can also be helpful if a patient calls with a problem and needs to be seen that day but no appointments are available. You may double-book this patient with an already-scheduled patient. In such cases you should explain to the caller that he might have to wait a bit before being seen by the practitioner. To avoid these circumstances, some offices purposely leave one or two appointment slots open each morning and each afternoon to accommodate these “urgent” appointments.

Cluster Scheduling

Cluster scheduling groups similar appointments together on a specific day or for a specific block of time during the day or week (also called categorization scheduling). Cluster scheduling is often used for appointments such as blood sugar screenings, school physicals, and the like; for instance, Wednesdays after 3 p.m. might be set aside for school physicals, as it would be a more convenient time for parents. Cluster schedules are also helpful in offices where specialized equipment or services (such as physical therapy or ultrasound) are available only at certain times.

Advance Scheduling

In some specialties patients might be booked weeks or months in advance, as for annual gynecologic examinations. In such practices **advance scheduling** is used. It is still advisable to leave a few slots open each day, however, for patients who call with unexpected or unusual problems.

REMARKS & NOTES				

FIGURE 16-5 Modified-wave schedule: two patients booked each half hour.

Combination Scheduling

Some practices combine two or more scheduling methods. For example, they might use cluster scheduling for new patients and double-booking for quick follow-ups such as sore throats, hypertension, or a new medication.

► Organizing and Scheduling Appointments

LO 16.4

As you determine patient needs and office availability when arranging appointments, always keep in mind that you are representing the office. How you interact with patients will have either a positive or a negative impact depending on your actions and choices. Being polite and courteous while maintaining a professional manner is key. Try to be as accommodating as possible to the patient but at the same time uphold the policies and protocols of the office.

As discussed earlier in the chapter, patient status (new or existing patient) and chief complaint must be clearly identified prior to scheduling any appointment, because this will dictate the length of time the physician will spend with the patient.

New Patients

Patients who have never been seen in the practice or have not been seen by the practice in 3 or more years are considered to be new patients. A convenient decision tree to help define patients as new or existing is found in the *Procedural Coding* chapter—Figure 19-4. Appointments for new patients are most often arranged over the telephone. Be sure to obtain all the necessary information, including the correct spelling of the person's name, home address, daytime telephone number, and date of birth. The patient's insurance information as well as the full name of the guarantor (if not the patient) and his or her relationship to the patient also should be obtained at this time. With so many insurance plans available, this has become increasingly important because it is impossible for any office to accept every insurance type. Even if the insurance is accepted by the office, verification of coverage should be done prior to the patient being seen in the practice. Obtaining this information also will allow you to remind the patient that if any copayment is required by his insurance plan, the payment is expected at the time of the visit. For more information on insurance coverage and the verification process, please refer to the *Insurance and Billing* chapter.

When arranging the appointment, keep in mind that the matrix will dictate availability of some types of appointments. When scheduling an appointment for a new patient, ask the patient to arrive 15–30 minutes early to allow time for filling out the required “new patient forms,” if they have not been sent to the patient prior to the appointment. Information regarding these forms may be found in the *Medical Records and Documentation* chapter. Upon arrival, the new patient also should be given the HIPAA guidelines for your office while his or her chart is being prepared for the visit.

As discussed in the *Legal and Ethical Issues* chapter, a signed receipt of the HIPAA privacy practices is now a requirement for all patients seen in the practice.

Established Patients

Established patients are those who have been seen by the practice within the last 3 years. Many times, return appointments for existing patients are made at the time they are being checked out from a current appointment. It is always good practice to ask patients returning to the reception area if they need to schedule another appointment. It is helpful for patients who are followed routinely to have appointments scheduled in a set pattern whenever possible. For instance, if a patient needs monthly B₁₂ injections, scheduling the appointments for the first Tuesday of each month at 3 p.m. will be easier for the patient to remember than a different day or time each month. Scheduling patients while they are still in the office also allows you to give them an appointment card to remind them of the appointment so they can enter it in their schedule or on the “home calendar.” If the patient's visit is being made by phone and is not for the immediate future, you also may ask her if she would like an appointment card mailed to her. Remember to remind existing patients, also, that any copayment is due at the time of the appointment. Procedure 16-2 at the end of the chapter outlines the procedure to utilize when booking patient appointments using a manual, paper system. Refer to the *Electronic Health Records* chapter and Procedure 12-4 for information on booking patient appointments using an electronic scheduling program.

Appointment Confirmations and Reminders

It seems today that everyone is busy with hectic schedules. It is often difficult for patients to remember their next appointment, especially if they arrange it far in advance. To help patients keep track of their appointments, you can use several types of appointment reminders.

Appointment Cards In many offices when making a return appointment at check-out, the medical assistant completes and gives the patient an appointment reminder card, like the one shown in Figure 16-6a.

To reduce the chance of error, enter the appointment in the appointment book or scheduler first; then fill out the card. Figure 16-6b shows a typical electronic scheduler screen for creating a new patient appointment. Otherwise, when the patient takes the appointment card, you have to rely on your memory when entering the appointment in the book and in a busy office this often can lead to errors. Refer to Procedure 16-3 at the end of the chapter for the steps in completing an appointment card.

Encounter Forms/Superbills As the patient leaves the office, he or she is often given paperwork to return to the front desk. This form, commonly known as the superbill or encounter form, lists services performed, diagnoses, health insurance, and demographic information regarding the

patient, as well as account balance. This *super document* also can serve as a receipt if payments are made at the time of the visit. Most superbills, like the one shown in Figure 16-7, also include an area to insert information regarding the patient's next appointment.

Reminder Mailings When making a follow-up appointment in person, ask the patient to address a postcard to himself on which you have written the next appointment's date and time. This postcard serves as a backup in case the patient loses the original appointment reminder card. Place the postcard in the tickler file under the day when it should be sent (usually a week or two before the appointment). Reminder mailings also can be sent to patients who make appointments over the telephone. In this case, of course, you must address the postcard for the tickler file yourself. Although reminder mailings are useful when appointments are made many

months in advance or for geriatric patients, they can become costly for the practice and should be limited when possible.

Confirmation Calls Depending on office policy and available time, you might also call patients 1 or 2 days before their appointments to confirm the scheduled time. This technique can be especially helpful for patients with a history of late arrivals or for **no-shows** (patients who do not call to cancel and do not come to the appointment). Writing patients' phone numbers next to their names in the appointment book makes it convenient for you to make appointment reminder calls. Procedure 16-4 at the end of the chapter outlines the steps in making appointment confirmation (or reminder) calls. Many offices that utilize electronic phone systems program the system to make reminder calls, freeing the office staff from this task. Be aware of patients who do not wish to be contacted by phone or to have messages left. Having the patient fill out a verbal contact agreement at her first visit can limit HIPAA violations. Figure 16-8 provides an example of a HIPAA-compliant verbal agreement form. If patients agree that messages may be left on voicemail or answering machines, be sure this information is added to the verbal agreement form.

Recall Notices Some offices book appointments no more than a few weeks in advance; others may not have the next year's schedule available when a patient is ready to book a return appointment. In either case, you need a way to make sure patients do not forget to call for appointments that are 6 months—or even a year—away from their last appointments.

Suppose, for example, that the practitioner tells a patient she should have an annual breast examination. How can you help her remember to call to schedule one at the appropriate time? One way is to use a system of recall notices. In a tickler file, enter the patient's name under the month when she should call the office. When the time arrives, send a form letter reminding her that she will soon be due for a breast examination and asking her to call for an appointment. Many EHR software programs offer such reminder programs as part of the software package.

E-mail Notifications With more practices trying to accommodate all patient groups, a newer approach to appointment scheduling is through the use of e-mail. Patients sign up (and sign the appropriate release to allow communication via e-mail) and are assigned passwords by the office. The patient may request an appointment via the office e-mail system (as long as it is not needed immediately). The office returns a confirmation e-mail of the scheduled appointment. When a scheduled appointment is approaching, an automatically generated notification goes out to the patient's e-mail address reminding him of the appointment. This is not suitable for all patients or all types of appointments. Some appointment types will still need to be handled by the office staff either by phone or in person because of the amount of information that needs to be relayed regarding the appointment and/or patient preparation for the appointment.

► Special Scheduling Situations LO 16.5

In most cases scheduling is routine; however, critical thinking, creativity, and flexibility are necessary for scheduling some special cases. These special situations often involve patients, but they also may involve physicians. Here are just a few of the special situations that may arise.

Patient Scheduling Situations

On some days all patients will keep their appointments and arrive on time. On many other days, however, patients may

walk in without appointments, arrive late for scheduled appointments, or miss appointments entirely. Being able to anticipate needs and being prepared for these possibilities allow you to handle them more efficiently, keeping the office schedule running smoothly.

Emergencies Your training as a medical assistant will help you recognize the signs of an emergency. In some instances you will refer the caller to the nearest hospital emergency room or instruct the caller to call emergency medical services (EMS) for an ambulance. The procedure

POINTS ON PRACTICE

Scheduling Emergency Appointments

As a medical assistant, you should be well prepared to tell the difference between acute conditions that are emergencies and those that are not. Guidelines on types of emergencies to be seen in the office and types to be referred elsewhere vary. Become familiar with these guidelines and if you have any doubt, check with the office manager or the practitioner to ask for instructions.

Even with allotted open times built into the daily schedule, emergencies are still disruptive to most practices. Your ability to stay calm, respond quickly, and remain flexible will be of great comfort to the patient seeking care and to others in the reception area. Read the following story to see how an emergency situation can be handled skillfully.

The Situation

It is 4:15 p.m. in a busy family practice. The telephone rings. The caller is the father of a 10-year-old boy. Kaylyn, the medical assistant, can hear the panic in his voice. His son Kyle has injured his knee while playing football with friends. Kyle cannot straighten the knee and it is quite swollen.

Kaylyn consults the practice orthopedist, who suspects torn cartilage. The physician tells Kaylyn to have Kyle's dad wrap ice in a towel, apply it to Kyle's knee, and bring him in immediately. Kaylyn relays this advice to the father and asks him how soon

he can get to the office. "It will take about 25 minutes," he replies.

The office schedule includes a time opening at 4:30, but based on the father's estimate, Kyle cannot possibly arrive until 4:40. Kaylyn notes that Mrs. Griffin, a good-natured retiree, is scheduled to come in for her weekly blood pressure check at 4:45 p.m. Her appointment is the last scheduled appointment of the day.

The Solution

Mrs. Griffin lives about 5 minutes from the office. Kaylyn calls her home and explains that there has been an emergency. She offers Mrs. Griffin three choices: She can come in at 4:30 and be seen then; she can arrive at the usual time and expect to wait; or she can be rescheduled for tomorrow due to an opening in the schedule. "No problem," Mrs. Griffin says cheerfully. "I'll come right over."

Mrs. Griffin arrives at 4:35. At 4:40, Kyle hobbles in, supported by his father. Kaylyn greets them and offers Kyle a chair on which to prop his foot.

Mrs. Griffin's blood pressure check is complete at 4:45. Kyle waits only 5 minutes before he is seen.

Thanks to Kaylyn's quick thinking, the office stays on schedule—essentially by switching one appointment for another and accommodating both patients with minimal interruptions.

you will follow will depend on office policies and procedures (refer to the *Telephone Techniques* chapter). In other instances you will ask the caller to come to the office right away so you can "work" him into the schedule. It is vital that the physician see an emergency patient before patients who are already in the reception area or on the schedule. It is best to explain to waiting patients that there has been an emergency (without giving details). This announcement helps them understand and accept the delay and gives them an opportunity to reschedule their appointments if they are unable to wait. Read the *Points on Practice* feature on scheduling emergency appointments, which contains a mock emergency appointment scenario.

Referrals If your practice includes specialists, it is a common occurrence that other practitioners will refer their patients to the practice for second opinions or special consultations. A patient seeking a second opinion before deciding on surgery, often at the request of his or her insurance carrier, should be fit into the schedule as soon as possible. Other referred patients also should be seen as soon as possible, both as a professional courtesy to the referring provider and as good business practice.

Many offices maintain a listing of preferred practitioners and facilities that they would like their patients to see and use. This list should contain the physician or facility names,

specialty, address, and their phone numbers. When arranging a referral, try to give the patient two names to choose from, along with the referral phone numbers and addresses.

When choosing the referral names of either practitioners or facilities, be sure that the facility accepts the patient's insurance and that all of the paperwork required by the insurance company has been completed. Some insurance carriers require a specific paper or electronic referral (or authorization) form be filled out. Most others today utilize an area of their website as a type of point of service (POS), where the medical office enters the information into the insurance company database and an authorization is returned on the spot. Some smaller carriers may require a phone request in which the medical office speaks to a customer service representative or enters specific information into an automated voice response telephone system. Regardless of the method used, all referrals and authorizations should be documented in the patient's medical record, including the authorization number given (if applicable) by the insurance carrier, authorizing the referral.

Fasting Patients Some procedures and tests require patients to fast, or refrain from eating or drinking anything, beginning the night before. Schedule these patients as early in the day as possible to show consideration for their needs. When scheduling appointments that require the patient to fast,

be sure to inform the patient of the need to fast and when the fasting should start, including the fact that the test may not be completed if the patient does not fast.

Patients with Diabetes Similar to fasting patients, patients with diabetes can use extra consideration when you schedule their appointments. In general, patients who take insulin must eat meals and snacks at regular intervals. This routine keeps their blood sugar from dropping too low—a condition that can result in confused thinking or even loss of consciousness. Therefore, you might want to avoid scheduling patients with diabetes for slots in late morning. This will help avoid the possibility of the patient waiting in the reception area during a time he should be eating a snack that is needed to keep his blood sugar levels on an even keel.

Late Arrivals If the practice has patients who are routinely late and gentle reminders to be on time have not helped, you might try booking them toward the end of the day. Even if a patient arrives late for a late-afternoon appointment, the provider will have already seen most of the day's patients and the late patient will not disrupt the schedule. Document late arrivals or missed appointments in the patient's chart. With documentation, patients who are habitually late can be called to discuss the reasons for their chronic tardiness. The goal of the discussion should be to find a solution so that patients can make their appointments on time and the schedule will run smoothly.

Walk-Ins From time to time, a patient may arrive without an appointment and still expect to see the provider. These people are called **walk-ins**. Office policies on how to handle walk-ins vary. If the person is experiencing an emergency, handle the situation as you would handle any emergency. Otherwise, you might politely explain that the doctor is fully booked for the day and offer to schedule an appointment in the usual manner. If an office PA or NP is available, suggest to the patient that this practitioner may be able to be of assistance. If, by chance, the doctor is available and willing to see the walk-in, you should still ask the person to call to schedule appointments in the future, as this is the usual policy for the practice. If your physician's office has a policy of no walk-ins, post a sign in the patient check-in area stating that patients are seen by appointment only.

Cancellations When patients call to cancel appointments, try to reschedule the appointment while they are on the telephone. If patients say they will call later to reschedule, note this information in the appointment book and thank them for the notice.

You should also write "canceled" in the appointment book, drawing a single line through the patient's name. To avoid confusion, cancel the first appointment *before* entering the patient's rescheduled appointment. Remember that the appointment book is a legal record. If you forget to cross out the name at the time of the first appointment, it may later seem that the doctor saw the patient twice. It is also important

to note the cancellation in the patient's medical record. This notation can protect the practice from possible legal action. For example, a patient whose surgical incision becomes infected cannot blame the surgeon if the patient canceled a scheduled appointment for a dressing change.

You may be able to fill slots created by cancellations by calling patients who have appointments scheduled for later in the day or week. Some patients may be willing to come in earlier than planned. When you make appointments, you can ask patients if they would be interested in coming in earlier if openings occur. Placing the names of interested patients in a tickler file or on a cancellation list can save time later.

Missed and Wrong-Day Appointments It is important for legal reasons to document a no-show in the appointment book and patient medical record. Always inform the physician of any missed appointments in case the patient's condition requires a follow-up. The provider may want you to call the patient with a polite reminder that the patient has missed an appointment and needs to reschedule. There may have been a misunderstanding about the time, or the patient may simply have forgotten the appointment. Some offices, especially ones that use computerized scheduling systems, send out form letters when patients miss appointments.

If failure to keep the appointment could endanger the patient's health, mention this possibility to the patient. The patient's provider also may wish to speak to the patient about the health issues possible due to repeated missed appointments. Some practices limit the number of times that a patient can miss, cancel, or repeatedly not show up for appointments, as this can lead to liability issues for the practitioner if the lack of follow-up leads to complications for the patient. Because of potential legal issues, it bears repeating to always document any missed or canceled appointments in the patient medical record. Refer to the *Legal and Ethical Issues* chapter to review the procedures to be followed so that providers cannot be charged with patient abandonment.

Periodically, practitioners charge for missed appointments, especially if patients habitually miss their appointments. These missed appointment charges are for missed business opportunities and not for services rendered. If your office implements this policy, make sure that you let patients know in advance before you start charging them for missed appointments. Most offices with this policy have the policy posted near the reception desk. Some offices also opt for a notation on the appointment cards that states patients will be charged for appointments that are canceled with less than 24 hours' notice.

Sometimes a patient may show up on the wrong day for her appointment. If the patient lives in the local area, rescheduling makes sense. But if the patient made special transportation arrangements or traveled from a long distance, it is good business practice to try to work the patient into the schedule for that day. If the patient provides an appointment card verifying the appointment for that day, but she is not on the schedule, the office is obligated to honor the appointment if the

physician is in the office. When in doubt about the best course of action, consult with the doctor or office manager.

Practitioner Scheduling Situations

Not all scheduling problems result from patients. Sometimes practitioners disrupt the office schedule as well. They may be called away on an emergency, may be delayed at the hospital, or may simply arrive late.

Some providers are occasionally late for appointments, while others are frequently late, either when arriving in the morning or when returning from lunch or a scheduled meeting. If this situation occurs in your office, it may be handled in several ways.

Speaking to the provider directly about the problem may be helpful in resolving the situation. You also might use the staff meeting to mention that the morning or afternoon schedule often seems to get off to a late start and ask if anyone has suggestions for improving this situation. The practitioner may recognize that she is the cause of the problem and decide to resolve it.

If the practitioner does not take responsibility for the problem, however, you may need to adjust the office schedule to handle the situation. Suppose, for example, that the first patient appointment slot is at 8:30 a.m., but the practitioner habitually does not arrive until 8:35 a.m. You could simply avoid scheduling patients between 8:30 and 8:45 a.m. If a provider is often 15 minutes late returning from lunch or from meetings, you might leave open the first appointment slot after the scheduled arrival time in an attempt to avoid long wait times for patients, keeping satisfied clients.

► Scheduling Outside Appointments

LO 16.6

You may be responsible for arranging patient appointments outside the medical office. These appointments may include

- Consultations with or referrals to other physicians.
- Laboratory work.
- Radiology (X-ray, CT scans, MRI).
- Other diagnostic tests (EKG, stress testing)
- Hospital stays.
- Inpatient and outpatient surgeries.

Scheduling Outpatient Procedures

Always verify the patient's insurance coverage before choosing the facility or provider for the patient's referral or other service. Today, a patient's insurance coverage may dictate both where a procedure may be performed and the practitioner allowed to provide the service. A prior approval or referral from the insurance carrier also may be required. The medical assistant is often responsible for knowing not only the preferred providers and facilities for the practice providers, but also the practitioners and facilities allowed by specific insurance carriers. Obtaining referrals and prior authorizations also will often be your responsibility. (Refer to the *Insurance and Billing* chapter for more information on this topic.)

Once a facility and provider have been agreed upon by the referring practitioner, patient, and insurance carrier, document any referrals or prior authorization numbers (again, refer to the *Insurance and Billing* chapter). If the procedure is elective, ask the patient if there is a preferred date and time. If the request fits into the provider and facility schedule, try to accommodate the patient's preference, as this gesture allows the patient to have some sense of control over a situation that is likely anxiety provoking.

Before calling the surgery center, laboratory, or outpatient department required for the procedure, be sure that you have the patient's medical record; the exact name of the procedure to be performed; the approximate amount of time required (if your practitioner is performing the service); the diagnosis; and the patient's insurance information, date of birth, phone number, and home address. Give this information to the scheduler, keeping in mind the patient's preferred time frame if it can be accommodated. Once an appointment time has been agreed upon, ask the scheduler for any patient instructions, carefully documenting them to relay to the patient. If paperwork will be sent to the patient from the facility, be sure the patient also understands this.

When arrangements have been made, inform the patient orally and provide him with written instructions, asking for and answering any questions the patient may have. Be sure he understands any preprocedure instructions and the fact that if the preprocedure instructions are not followed perfectly, the procedure may need to be rescheduled or repeated. Remember to note in the patient's chart the date and time of the procedure as well as instructions provided to the patient. Procedure 16-5, found at the end of the chapter, outlines the procedure for booking an outpatient surgical appointment.

Reserving an Operating Room

If the surgeon in your office plans to perform surgery at a hospital, you will need to call the operating room scheduler to reserve the facility. As when booking an outpatient procedure, you will first give the preferred dates and times, the type of surgery, and the length of time the provider will need the operating room. After the day and time are set, provide the scheduler with all relevant patient information. Relay any requests from the doctor, such as the blood type and units of blood that may be needed. It also may be your responsibility to make arrangements for surgical assistants, an anesthetist, and a hospital bed for the patient following surgery. Make sure that all health insurance requirements such as referrals and prior authorizations are met and copies of forms and authorization numbers are filed appropriately. As when scheduling outpatient procedures, be sure the patient receives all necessary oral and written instructions and information regarding

pre- and postsurgical care and that all questions are answered. Procedure 16-6, found at the end of the chapter, outlines the steps for booking an inpatient surgical appointment.

► Maintaining the Practitioner's Schedule

LO 16.7

The schedules of busy practitioners are not limited to office visits with patients. Licensed practitioners also need to attend professional meetings, travel to conferences, present speeches to colleagues, complete paperwork, and perform other duties. Your job is to help the providers in your practice make the most efficient use of their time.

One way to assist each provider with his schedule is to avoid overbooking appointments with patients. **Overbooking** (scheduling more patients than can reasonably be seen in the time allowed) creates stress for the provider and the staff and makes it difficult to maintain a timely schedule.

The opposite problem, **underbooking**—leaving large, unused gaps in the schedule—does not make the best use of the practitioner's time. Of course, you have no control over patients who cancel or do not show for appointments, but, as mentioned previously, there are ways to decrease this, such as calling patients to remind them of their appointments a day or two ahead of the scheduled appointment. If you cannot reschedule another patient for the empty slot, the provider can use the time to catch up on telephone calls to patients or to attend to other matters.

At times you will have to cancel appointments because the provider has been delayed or called away by an emergency. Apologize to waiting patients on behalf of the provider and offer them a choice. Explain that they can wait in the office (give an estimated waiting time), leave to run errands and return later, or reschedule their appointments for another day. Documentation should be noted in the patient's chart that because of an emergency in the office, the appointment had to be rescheduled by the office so the patient is not held at fault for the cancellation. Be sure to write the date of the rescheduled appointment in the chart as well. Always make sure patients who need immediate attention are seen by another provider if available, staying within office policies.

Visits Outside the Office

Some practitioners provide care outside of the office—in patient homes, in nursing homes, or during rounds within the hospital when their patients have been admitted.

House Calls Practitioners may want to check on home-bound or nonambulatory patients as part of their follow-up care.

Although not as common as it once was, house calls are a valuable service that practitioners can provide to patients who can no longer easily make it to the medical office for their appointments. Many insurance companies allow the practitioner to bill for these services with restrictions that vary depending on the plan. Supplies required for visits vary depending on the type and location of the visit, but general supplies that should be kept in a medical bag include the following:

- Blood pressure cuff
- Stethoscope
- Specimen containers
- Otoscope
- Ophthalmoscope
- Prescription pad
- Pen light
- Thermometer
- Gloves, face shield

Hospital Rounds Historically, physicians typically visited their own patients when they became hospitalized. Today, more and more hospitals are turning this responsibility over to a physician specialist known as a hospitalist. A hospitalist does not hold office hours and does not maintain a practice but only sees patients while they are hospitalized. If your office or the hospital where your physicians have privileges utilize hospitalists, they will report to the physician on the patient's progress and findings while an inpatient.

Nursing Home Visits Some practitioners check on their patients even when they are receiving around-the-clock care from a skilled nursing facility. Usually the practitioner has seen these patients for years and stays involved with their care because of the long-standing relationship or because the patient will be returning home after a rehabilitation stay and will need follow-up care.

“Mouse Calls” With all of the new technology available to them, providers are learning new ways to communicate with their patients. In their daily schedule, time is often allotted for practitioners to return phone calls, which today can also include “mouse” calls—practitioners answering e-mail inquiries from their patients. These also can be “virtual visits” covered by some insurance plans. Be sure that the appropriate releases are in the patient's file before the provider undertakes this type of communication with the patient.

Scheduling Pharmaceutical Sales Representatives

Drug manufacturers often send pharmaceutical sales representatives into medical offices with printed information about new drugs as well as free samples that can be given to patients. This is an added benefit for your patients but can be time consuming, as the representatives will want to market their products. The representatives are required to obtain signatures from the licensed practitioners in order to leave the samples behind, and for this reason, some practitioners do not

want to meet with pharmaceutical representatives. Others are willing to spend a few minutes if time permits and if the products are likely to be useful to their patients. Some practitioners set aside certain times or days during the week when they will meet with pharmaceutical representatives. Many prescribers prefer that the representative leave a business card with the products represented, and if the provider is interested, she will call and arrange for an appointment at a mutually agreeable time. When a pharmaceutical representative who is unknown to you comes into the office, ask for a business card and check with the licensed practitioner or business manager before scheduling an appointment (Figure 16-9).

Making Travel Arrangements

You may be responsible for arranging transportation and lodging when practitioners attend meetings, speaking engagements, and other events out of town. You may be responsible for contacting the airlines, car rental agencies, hotels, or other services yourself, or you may use an online service such as Orbitz® or work through a travel agent. No matter which method is used to make travel arrangements, always request confirmation documents of travel and room reservations.

Before the day of departure, obtain an itinerary from the travel agent or online service, or create one yourself. An **itinerary** is a detailed travel plan, listing dates and times of flights and events, locations of meetings and lodgings, and

FIGURE 16-9 Pharmaceutical sales representatives who cannot see the licensed practitioners often leave a business card listing the medications from their company.

© altrendo images/Getty Images RF

telephone numbers. Give several copies to the provider and keep one for the office (Figure 16-10).

You also may be responsible for scheduling and confirming professional coverage of the practice during the physician's absence. In larger practices and more urban areas, physicians in the same or a nearby practice often provide coverage while the physician is away. This coverage may be important for legal reasons, most importantly so the physician cannot be charged with abandoning patients. If a local physician is not readily available, a **locum tenens**, or substitute physician, may be hired to see patients while the regular physician is unavailable. *Locum tenens* is Latin for "one occupying the place of another." You may have more than one *locum tenens* on call, depending on the practice. In some areas special firms provide these services and other temporary medical and nursing assistance. Before hiring a *locum tenens*, you may want to contact some of the major insurance carriers providing health insurance coverage for your patients to find out his or her credentialing and claim requirements so that the services provided by the *locum tenens* will be considered covered services.

Planning Meetings

Another of your duties may be to assist the provider in setting up meetings for professional societies or committees. To do so, you will need to know how many people are expected to attend, how long the meeting will last, and the purpose of the meeting. In addition, ask the doctor if a meal is to be served.

Some groups have a schedule of meetings planned in advance and meet in a consistent location, but if there is no established meeting place, you must choose and reserve one. Select a location with an adequately sized meeting room, sufficient parking, and, if needed, food services. Be sure also to arrange for necessary audiovisual (AV) equipment, such as a microphone, podium, or projector. Many conference centers and hotels have an on-site catering manager or conference manager to assist you with these arrangements. When the facility has been booked, mail (or e-mail) an invitation to all those expected to attend the meeting. On the invitation, provide the topic, names of the speakers, date, time, place, and admission costs or fees associated with the event if applicable.

With direction from the practitioner, you also may be responsible for creating the meeting's agenda, as discussed in more detail in the *Practice Management* chapter. After the meeting, you also may be asked to prepare the **minutes**, the report of what was discussed and decided upon at the meeting.

Scheduling Time with the Practitioner

You and the practitioner should meet on a scheduled basis to discuss any irregularities or changes in the day-to-day workings of the office. These meetings may be held between you and the provider alone or include the office manager. If items are not pressing or "private," many discussions may be included in regularly scheduled office meetings. Topics discussed may include practice finance items such as insurance premiums, taxes, and other financial matters, as well as professional licenses and renewal requirements for the medical staff. These items are discussed in further detail in the *Practice Management* chapter.

Paul F. Buckwalter, MD

Travel Itinerary

BWW Medical Associates, PC

305 Main Street, Port Snead YZ 12345-9876

Client Information

Traveler's Name	Paul F. Buckwalter, MD
Address	560 Williamsburg Ct., Port Snead, YZ
Telephone Number	555-279-0098
Fax Number	555-987-6543
E-mail Address	
Travel Dates	May 5 – 9, 20XX

Departure Flight

Date	May 5, 20XX
Airline	United International
Flight Number	567
From	Port Snead, YZ
Departure Time	6:45 am
Departure Terminal/Gate	56C
To	Los Angeles, CA
Arrival Time	9:45 am Pacific time
Length of Flight	5 hours
Class	First Class
Seat Number	12a
Status	confirmed

Monday – May 5, 20XX

• Morning:

8:00 – 8:45	Physician Recruiter
9:00 – 10:00	Formal interview with Team, facilitated by Recruiter
10:00 – 11:00	Medical Director
11:00 – 12:00	Tour of UCLA including department with Area Manager

• Afternoon:

12:30 – 1:30	Lunch with physician(s) from another department with similar interests
2:00 – 3:00	One (1) hour with Department Chair and/or Physician Area Manager
4:00 – 6:00	One-on-one interviews with department or other physicians Informal time in interviewing department, as appropriate

• Evening:

7:00 – until	Dinner (or private dinner on their own)
--------------	--

FIGURE 16-10 Typical travel itinerary.

PROCEDURE 16-1 Creating an Appointment Matrix

WORK // DOC

Procedure Goal: To create an appointment matrix to indicate the days and the hours the physician is not scheduling patients

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Appointment record, pencil or pen; physician schedule of meetings, conferences, vacations, staff meetings, and other times of unavailability when patients are not seen

Method:

1. Using the practitioner schedule of availability as the base for the matrix, confer with the practitioner or office manager to ensure that no additional schedule changes are planned.

RATIONALE: *The matrix should be as complete as possible to avoid the need to reschedule appointments.*

2. Indicate within each area the reason the time is being closed to appointments, such as lunch, hospital rounds, or AAMA meeting.
RATIONALE: *Allows for all users to be aware of provider location both in and outside of the office*
3. If the office utilizes cluster scheduling for certain appointments such as physical exams and blood sugar

testing, these time frames also must be set apart. Following office policy, such as using brackets, note the appropriate appointment type to be scheduled during this time frame.

RATIONALE: *It is important for all users to know what type of appointments can be booked in each time frame.*

PROCEDURE 16-2 Scheduling Appointments

WORK // DOC

Procedure Goal: Utilizing the previously created matrix, book patient appointments applying the correct amount of time for each appointment

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Appointment book and pen or pencil, or electronic scheduler (with appropriate matrix) template, outlining time frames for patient appointment types

Method:

1. Establish the type of appointment required by the patient, particularly if this is a new patient or a returning patient.
RATIONALE: *New patients typically require a longer appointment time than do returning existing patients.*
2. If necessary, consult the template for the amount of time required for the patient appointment. Keep in mind the reason for the appointment when scheduling (for example, is the patient required to be fasting).
RATIONALE: *Some appointments are best scheduled at certain times of the day depending on patient preparation and equipment or personnel availability.*

3. When possible, schedule appointments earlier in the day first and then move to later time frames. Do ask the patient if he or she has a preferred time frame in mind and, if at all possible, accommodate the request.

RATIONALE: *Open appointments later in the day allow space for unexpected appointments required at a later time.*

4. When using an appointment book, enter the patient name, phone number, and reason for the appointment in the appropriate space, blocking out additional blocks of time if necessary to accommodate a longer appointment time.
5. If an electronic scheduler is used, use the search option to find the next available appointment for the time frame required for the appointment. Enter the patient name, phone number, and reason for the appointment.
6. Repeat the appointment information to the patient, giving any necessary instructions regarding preparation for the appointment, such as early arrival for blood tests. Also, this is a good time to remind patients about any copayments that will be due at the time of the appointment.
RATIONALE: *Patients respond best when they know what is expected ahead of time.*

PROCEDURE 16-3 Completing the Patient Appointment Card

WORK // DOC

Procedure Goal: To accurately complete a patient appointment card for the patient's next visit

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Appointment book or electronic scheduler, pen, and appointment card

Method:

1. After entering the patient's appointment in the appointment book or electronic scheduler, repeat the appointment date and time to the patient to verify accuracy.
2. Complete the patient appointment card, entering the appointment date and time on the card. If the practice has multiple providers, there may also be a place for the appropriate physician name to be entered, and you should do so.
RATIONALE: *If patients see multiple providers, it is not unusual for them to forget a provider's name.*
3. Repeat appointment information to the patient one more time when giving the card to him or her, again verifying the information.

PROCEDURE 16-4 Placing Appointment Confirmation Calls

Procedure Goal: To decrease the number of no-show patients by making appointment confirmation calls 24–48 hours prior to the scheduled appointment

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Office appointment book, electronic scheduler, or listing of patients scheduled to be seen tomorrow or the next day, with their home phone numbers

Method:

1. Starting with the first appointment of the day, call the patient listed.
2. If the phone is answered, ask for the patient. If you reach the patient, give your name and the name of the practice and state that you are confirming the patient's appointment for the applicable date and time.
3. Remind the patient of any special instructions regarding the appointment such as fasting, bringing in medical record or registration information, and copayments due.
RATIONALE: *It is important that the patient come to the appointment prepared, or any testing may need to be postponed.*

4. If the patient is not available, leave your name and phone number, asking that the patient return your call.
RATIONALE: *Unless the person answering the phone has been listed by the patient as someone to whom you may give confidential information, you must speak directly with the patient to avoid breach of patient confidentiality.*
5. If a voicemail or answering machine system is reached, follow the practice confidentiality rules of leaving only your name and phone number, asking the patient to call you back, unless you have permission from the patient to leave more explicit information on voicemail.
RATIONALE: *Unless you have express written permission from the patient to leave a message on an answering machine or voicemail, confidentiality regulations require you not leave explicit information.*
6. Thank the patient for his or her time, stating you will see him or her at the stated date and time.
7. Allow the patient to hang up first, so if there are questions, you can answer them.
RATIONALE: *This allows the patient to have all questions or issues addressed adequately.*

PROCEDURE 16-5 Scheduling Outpatient Surgical Appointments

WORK // DOC

Procedure Goal: To schedule an outpatient surgical procedure

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Patient medical record and progress note form, calendar, telephone, pen

Method:

1. Obtain detailed information regarding the procedure to be performed from the surgeon and patient medical record. Information should include the name of procedure to be performed, the amount of time the outpatient surgical suite will be needed, and the reason (diagnosis) for the procedure.
RATIONALE: *Without this information, you will be unable to efficiently book the required appointment.*
2. From the patient's medical record, you will need the patient's full name, DOB, allergies, current medications, address, phone number, and insurance information.
RATIONALE: *This information will be needed by the facility booking the procedure.*
3. Place a call to the appropriate surgery center or outpatient surgical unit at the requested facility. Have the name of the surgeon, assistant, or PA (if used) available, as well as the patient's and physician's preferred dates for the procedure.

4. When the appointment scheduler answers the phone, identify yourself, the practice, and the procedure you need to schedule, as well as the preferred dates.
5. When a date for the procedure is agreed upon by the patient, give the scheduler the patient's name, address, phone number, DOB, gender, and insurance information, including the prior authorization number if needed. Also give the patient's diagnosis as required for medical necessity.
RATIONALE: *This information will be needed by the facility for booking and billing purposes.*
6. Inquire as to any preprocedure testing that may need to be done as well as any patient preparation required prior to the procedure, including patient arrival time.
RATIONALE: *This information will need to be relayed to the patient for adequate preparation for the procedure.*
7. Confirm the appointment date and time prior to hanging up. If necessary, book any preprocedure testing for the patient and document these appointments in the patient instructions and appropriate office form(s) and/or within the patient's medical record.
RATIONALE: *Always document any patient-related information in the patient's medical record.*
8. Provide the patient with written instructions from the physician as well as all information obtained while

booking the appointment. The patient also should be informed that he should arrange for someone to drive him to and from this appointment.

9. Go over the written dates and instructions with the patient, asking the patient if there are any questions, answering them if possible, and, if not, asking a clinical member of the team to do so.

RATIONALE: *It is important that the patient thoroughly understand the reason for the procedure and all preprocedure instructions to be adequately prepared for the procedure.*

10. Give a copy of instructions and information to the patient and keep a copy in the patient record. Remind the patient to feel free to call the office at any time with any questions or concerns.

RATIONALE: *Written instructions will back up what has been relayed to the patient and serve as a reminder for the patient.*

PROCEDURE 16-6 Scheduling Inpatient Surgical Appointments

WORK // DOC

Procedure Goal: To schedule an inpatient surgical procedure

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Patient medical record and progress note form, calendar, telephone, pen

Method:

1. Obtain detailed information regarding the procedure to be performed from the surgeon and patient medical record. Information should include the name of the procedure to be performed, the amount of time the inpatient surgical suite will be needed, and the reason (diagnosis) for the procedure.
RATIONALE: *Without this information, you will be unable to efficiently book the required appointment.*
2. From the patient's medical record, you will need the patient's full name, DOB, allergies, current medications, address, phone number, and insurance information.
RATIONALE: *This information will be needed by the facility booking the procedure.*
3. Place a call to the appropriate surgical unit at the requested hospital. Have the name of the surgeon, assistant, or PA (if used) available, as well as the patient's and physician's preferred dates for the procedure.
4. When the appointment scheduler answers the phone, identify yourself, the practice, and the procedure you need to schedule, as well as the preferred dates.
5. When a date for the procedure is agreed upon by the patient, give the scheduler the patient's name, address, phone number, DOB, gender, and insurance information, including the prior authorization number if needed. Also give the patient's diagnosis as required for medical necessity.

RATIONALE: *This information will be needed by the facility for booking and billing purposes.*

6. Inquire as to any preprocedure testing that may need to be done as well as any patient preparation required prior to the procedure, including patient arrival time.

RATIONALE: *This information will need to be relayed to the patient for adequate preparation for the procedure.*

7. Confirm the appointment date and time prior to hanging up. If necessary, book any preprocedure testing for the patient and document these appointments in the patient instructions and appropriate office form(s) and/or within the patient's medical record.

RATIONALE: *Always document any patient-related information in the patient's medical record.*

8. Provide the patient with written instructions from the physician as well as all information obtained while booking the appointment. The patient also should be informed that he should arrange for someone to drive him to and from the hospital.
9. Go over the written dates and instructions with the patient, asking the patient if there are any questions, answering them if possible, and, if not, asking a clinical member of the team to do so.

RATIONALE: *It is important that the patient thoroughly understand the reason for the procedure and all preprocedure instructions to be adequately prepared for the procedure.*

10. Give a copy of instructions and information to the patient and keep a copy in the patient record. Remind the patient to feel free to call the office at any time with any questions or concerns.

RATIONALE: *Written instructions will back up what has been relayed to the patient and serve as a reminder for the patient.*

S U M M A R Y O F L E A R N I N G O U T C O M E S

LEARNING OUTCOMES	KEY POINTS
16.1 Describe how the appointment book is key to the continuity of patient care.	The appointment book or electronic scheduler and its matrix, when used properly, allow the office staff to respect the time of both the practitioner and the patient, by keeping an efficient and timely flow of patients throughout the day.
16.2 Identify how to properly apply a matrix to an appointment book.	To create a matrix, in either an appointment book or an electronic scheduler, you must know the usual schedule of provider availability to see patients as well as the times the provider (or practice) will not be open to see patients. The latter times should be X'd out with a short reason given as to why the time is unavailable. Follow the instructions for the electronic scheduler to block out the appropriate time frames.
16.3 Compare different types of appointment scheduling systems.	The most commonly used types of scheduling systems are open-hours, time-specified, wave, modified-wave, double-booking, cluster, and advance scheduling. It is also common for offices to use any combination of these as best suits each practice.
16.4 Identify ways to organize and schedule patient appointments.	When organizing and scheduling patient appointments, always maintain a positive, professional image as a representative of the office. The patient's status as a new or established patient should be considered as well as patient preference whenever possible. The goal is to accommodate the patient as much as possible while maintaining an efficient office schedule. Appointments should be confirmed through appointment cards, phone calls, e-mail notification (when permitted by the patient), and mailing of recall notices.
16.5 Model how to handle special scheduling situations.	Handling special scheduling situations requires critical thinking skills and creativity. Scheduling situations can arise if the practitioner is running late or if a patient requires an emergency appointment. Other scheduling problems also may include a patient who does not show, arrives late, or arrives on the wrong day. Documentation of any patient-related appointment issues should be recorded in the patient's medical record for legal purposes.
16.6 Explain how to schedule appointments that are outside the medical office.	Outside appointments may need to be made to laboratories, for radiology services, for in- and outpatient surgeries, for hospital stays, or for other diagnostic tests. In order to efficiently book such appointments, you will require the patient's demographic and health insurance information along with the procedure or service to be performed and the reason for the service. Preferred dates and times also should be noted. If referrals or prior authorizations are required, you also may be required to obtain these so that the procedure/ service is eligible for payment by the patient's insurance plan.
16.7 Implement ways to keep an accurate and efficient practitioner schedule.	As the office medical assistant, your duties will include maintenance of the office schedule. The practitioner's schedule should ensure an even flow of patients throughout the day. Errors or overbooking may require you to rearrange appointments as necessary and to accommodate emergency appointments with minimal interruptions to the already-established schedule. If the schedule is consistently overbooked or patient wait time becomes consistently too long, it will be your responsibility to find the cause(s) and corrections for the issues and present these to the practitioner or office manager.

CASE STUDY CRITICAL THINKING

© McGraw-Hill Education

Recall John Miller from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding his case.

1. What information will you need before you can book the cardiac catheterization?

2. Explain the process for scheduling this procedure.

EXAM PREPARATION QUESTIONS

1. (LO 16.1) The appointment book and its format are dependent on all of the following items *except*
 - a. Practitioner preference
 - b. Facilities available
 - c. Patient need
 - d. Practitioner habits
 - e. Office location
2. (LO 16.2) When should you apply the matrix to your appointment book?
 - a. On the first day of the new year
 - b. When you first get it, if possible
 - c. When scheduling appointments
 - d. After appointments have been made
 - e. At the beginning of every quarter
3. (LO 16.3) This type of scheduling groups similar appointments together on a certain day of the week or for certain times of day, which may be helpful with equipment and staffing.
 - a. Time-specified
 - b. Wave
 - c. Open-hours
 - d. Cluster
 - e. Modified-wave
4. (LO 16.3) Which type of scheduling is also called *stream scheduling*?
 - a. Time-specified
 - b. Wave
 - c. Open-hours
 - d. Cluster
 - e. Modified-wave
5. (LO 16.4) In terms of scheduling, the term “no-show” means
 - a. The patient has passed away
 - b. The patient is no longer coming to the office
 - c. The patient does not call or show up for his scheduled appointment
 - d. The patient comes to his appointment but then leaves before seeing the doctor
 - e. The patient shows up early for his appointment
6. (LO 16.5) What is the best approach for handling the cancellation of an appointment by a patient?
 - a. Send the patient a letter pointing out she canceled a necessary appointment
 - b. Attempt to schedule another patient in the canceled slot
 - c. Schedule other activities in those canceled slots
 - d. Encourage the physician to take time off
 - e. Remind the patient of the importance of follow-up care and if possible schedule her for another appointment while she is still on the phone
7. (LO 16.6) Why should the insurance company be contacted prior to scheduling an appointment outside of the office?
 - a. To pay for services
 - b. As a courtesy
 - c. Because the test is physician ordered
 - d. To give them the confirmation number
 - e. To determine if the service is covered and obtain an authorization number
8. (LO 16.6) When scheduling an appointment for an abdominal CT scan, what steps should be taken?
 - a. Have all information from the physician regarding the appointment and access to the patient’s medical record
 - b. If possible book the appointment when the patient is present to ascertain a convenient time for the patient
 - c. After making the appointment, repeat the information, writing it down for the patient
 - d. Give the patient oral and written instructions, answering any questions
 - e. All of these
9. (LO 16.7) In what way(s) can the medical assistant assist a practitioner in managing the in-office schedule?
 - a. Avoid overbooking
 - b. Avoid underbooking
 - c. Double-book appointments when possible
 - d. Avoid overbooking and underbooking
 - e. Avoid underbooking and double-booking when possible

10. (LO 16.7) All of these appointments take place outside of the medical office *except*
- House calls
 - Nursing home visits
 - Mouse calls
 - Hospital visits
 - ED visits

Go to CONNECT to see activities about *Scheduling an Appointment for a New Patient*, *Scheduling an Appointment for an Existing Patient*, *Blocking Appointment Times*, *Charting a No Show*, and *Locating an Existing Appointment*.

SOFT SKILLS SUCCESS

Recall John Miller from the case study at the beginning of the chapter.

- Dr. Buckwalter asks you to book a cardiac catheterization for Mr. Miller. This is a day stay procedure performed at the local hospital by Mr. Miller's cardiologist. What information will you need to convey to Mr. Miller, and how will you do so?
- Mr. Miller has a Medicare replacement plan that requires Dr. Buckwalter to obtain a prior approval for this

procedure from the insurance plan. What type of information would you expect the insurance plan will need from you to issue this approval?

Go to PRACTICE MEDICAL OFFICE and complete the module Admin: Check Out - Work Task Proficiencies.

Insurance and Billing

CASE STUDY

PATIENT INFORMATION	Patient Name	DOB	Allergies
	Sylvia Gonzales	09/01/19XX	Penicillin
	Attending	MRN	Other Information
	Alexis N. Whalen MD	341-73-792	HMO copay \$25.00 for last visit is past due.

Sylvia Gonzales is a 51-year-old female with recently diagnosed Type 2 diabetes mellitus. She states that she has been faithful in taking the new medication the doctor has prescribed for her “sugar.” She knows she is having a special “sugar test” done during her visit today. Her medications include Januvia 100 mg daily. Dr. Whalen has ordered a fasting blood sugar (FBS) and hemoglobin A_{1c} test to be done today. The FBS result is 106 and the

© McGraw-Hill Education

hemoglobin A_{1c} result is 7.0. Mrs. Gonzales is encouraged to continue with her weight loss program through the local hospital’s diabetes clinic and receives a return appointment for 3 months from now. Mrs. Gonzales has insurance through her husband, Juan (DOB 6/24/XX), as well as coverage through her own employer. Her husband’s insurance is a traditional

fee-for-service plan and her coverage is an HMO plan in which BWV Medical Associates participates.

Keep Sylvia Gonzales in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

 **ACTIVSim**

LEARNING OUTCOMES

After completing Chapter 17, you will be able to:

- 17.1** Define the basic terms used by the insurance industry.
- 17.2** Compare fee-for-service plans, HMOs, and PPOs and explain the new concept of patient centered medical home.
- 17.3** Outline the key requirements for coverage by the Medicare, Medicaid, TRICARE, and CHAMPVA programs.
- 17.4** Describe allowed charge, contracted fee, capitation, and the formula for RBRVS.
- 17.5** Outline the tasks performed to obtain the information required to produce an insurance claim.
- 17.6** Produce a clean CMS-1500 health insurance claim form.
- 17.7** Explain the methods used to submit an insurance claim electronically.
- 17.8** Recall the information found on every payer’s remittance advice.

KEY TERMS

- | | |
|-------------------------------|---|
| allowed charge | fee schedule |
| benefits | health maintenance organization (HMO) |
| birthday rule | patient centered medical home (PCMH) |
| capitation | preauthorization |
| clearinghouse | precertification |
| coinsurance | preferred provider organization (PPO) |
| copayment | premium |
| deductible | remittance advice (RA) |
| dependents | resource-based relative value scale (RBRVS) |
| dual coverage | third-party payer |
| elective procedure | utilization review (UR) |
| explanation of benefits (EOB) | |
| explanation of payment (EOP) | |
| fee-for-service | |

- VIII.C.1** Identify:
 - (a) types of third party plans
 - (b) information required to file a third party claim
 - (c) three steps for filing a third party claim
- VIII.C.2** Outline managed care requirements for patient referral
- VIII.C.3** Describe the processes for:
 - (a) verification of eligibility for services
 - (b) precertification
 - (c) preauthorization
- VIII.C.4** Define a patient-centered medical home
- VIII.P.1** Interpret information on an insurance card
- VIII.P.2** Verify eligibility of services including documentation
- VIII.P.3** Obtain precertification or preauthorization including documentation
- VIII.P.4** Complete an insurance claim form
- VIII.A.1** Interact professionally with third party representatives
- VIII.A.2** Display tactful behavior when communicating with medical providers regarding third party requirements.
- VIII.A.3** Show sensitivity when communicating with patients regarding third party requirements
- X.C.8** Describe the following types of insurance
 - (a) liability
 - (b) professional (malpractice)
 - (c) personal injury
- X.P.2** Apply HIPAA rules in regard to:
 - (a) privacy
 - (b) release of information

4. Medical Law and Ethics

- a. Follow documentation guidelines

8. Administrative Procedures

- a. Gather and process documents
- b. Perform billing and collection procedures
 - (1) Payment procedures
- c. Process insurance claims
 - (1) Differentiate between procedures of private, federal and state payers
 - (2) Differentiate managed care; i.e. HMO, PPO, IPA including referrals and precertification

11. Career Development

- b. Demonstrate professional behavior

► Introduction

Insurance claims are a critical part of the reimbursement process. Accurate claims sent to payers ensure that medical practices receive the maximum appropriate payment for the services they provide. Patients are also concerned with their healthcare plans, asking, “How much will my insurance pay?” “How much will I owe?” “Why are this provider’s fees different from my previous provider’s fees?”

As the office medical assistant, you will handle questions like these every day. Not only must you correctly prepare healthcare claims, but you also will review each patient’s insurance coverage, explain the provider’s fees, estimate what services are covered by payers, prepare the claims to be submitted for these charges, and then understand the payment explanation

when it is returned with the payment from the payer. This chapter prepares you for these tasks by explaining the types of healthcare insurance plans available to patients today, how payers calculate their payments for services provided, and how to transmit complete and accurate claims. Finally—because, ultimately, the patient is responsible for the cost of the treatment received—you also will learn how to calculate the patient’s financial responsibility for the treatment and his or her responsibility for care not covered by the insurance carrier.

► Basic Insurance Terminology

LO 17.1

The first step in understanding insurance is learning some basic terminology used by the insurance industry. Medical insurance, also known as health insurance, is a written

contract in the form of a policy between a policyholder and a health plan (insurance carrier). The policyholder may also be called the insured, the member, or the subscriber. Under the insurance policy, the policyholder pays a **premium** (usually monthly)—the amount the policyholder pays the insurance company for the insurance coverage. In exchange, the health plan provides **benefits**—payments for medical services—for a specified time period. The policy may cover **dependents** of the policyholder, like a spouse or children. The contract also may specify a lifetime maximum benefit, which is a total sum the health plan will pay out over the patient's lifetime.

There are actually three participants under insurance contracts. The patient (policyholder) is the *first party* and the licensed practitioner who provides medical services is the *second party*. The patient often has a policy (written contract) with a health plan, the *third party*, who agrees to carry the risk of paying for those services and therefore is called a **third-party payer**.

When a patient seeks medical services and a practitioner agrees to treat the patient, the result is an implied contract between the patient and the practitioner. The patient then signs a written financial contract as the party legally responsible for paying for services. Any costs not covered by the third-party insurance company is then the responsibility of the patient.

Depending on the type of health plan, the policyholder may pay a **deductible**—a fixed dollar amount that must be paid by the insured for charges of providers, or “met,” once a year in addition to the premium, before the third-party payer begins to cover medical expenses. The patient also may have to pay **coinsurance**—a fixed percentage of covered charges after the deductible is met. The coinsurance rate represents the health plan's percentage of the charge followed by the insured's percentage, such as 80-20. This means the insurance carrier pays 80% of allowed charges and the patient is responsible for the remaining 20%. If the patient belongs to a managed care health plan, like a health maintenance organization (HMO), instead of paying coinsurance the patient is responsible for a per-visit **copayment**—a fixed fee collected at the time of the visit. The patient goes to a practitioner who is a *preferred provider* for the insurance plan. The health plan pays the practitioner a set “contracted rate” agreed to by the plan and the practitioner for each service provided. The practitioner agrees to accept that payment, in addition to the patient's copayment, as payment in full for the service. Any balance on the patient's account after the copayment and insurance benefit have been received is adjusted off the patient's account, bringing the balance to zero.

Some expenses, like routine eye examinations or dental care, may not be covered under the insured's contract. These noncovered expenses are called *exclusions*. Although many insurance plans offer prescription drug benefits, be aware that such benefits often require the use of drugs listed on the plan's *formulary* (a list of approved brands). If a prescription for a nonformulary medication is written, the pharmacy or health plan case manager will usually contact the prescriber, asking if a substitution of a formulary drug can be made. If not, the patient may be responsible for a large portion, if not all, of the prescription's cost.

Many procedures and surgeries done today are “planned” procedures—that is, done at the convenience of the physician

or surgeon and the patient. This type of procedure is known as an **elective procedure**. Many of these procedures are covered by third-party payers but only if certain rules prior to performance of these procedures are followed. **Precertification** is the process of confirming with an insurance company that a patient's insurance plan offers coverage for a specific procedure or service. When planning an elective procedure or service for a patient, most offices take this process one step further, by performing a preauthorization, also known as a prior authorization. A **preauthorization** is the receipt of confirmation from the patient's insurance plan that the proposed procedure or service will be considered a *covered service* because of the individual patient's specific circumstance that requires the procedure or service to be performed. If the insurance carrier agrees that the patient requires the procedure—in other words, it is *medically necessary*—the insurance carrier will issue a prior authorization number approving the need for the service or procedure. The prior authorization does not, however, mean that the insurance carrier agrees to pay for the service. This requires the next step of *predetermination*, in which the insurance carrier informs the provider of the maximum amount it will pay for the procedure to be performed. Once preauthorization is given, the documentation about the care given must “back up” the procedure codes submitted to the insurance carrier, or the charges may still be denied.

► Private Health Plans

LO 17.2

All insurance companies have their own rules about benefits and procedures. Most even have their own printed and/or online manuals that must be kept handy in the office for reference. Most insurance plans also have websites and toll-free numbers available for providers to answer questions. Do not be afraid to use these tools. If the first answer you receive does not sound correct, hang up and call back. You will more than likely get a different representative. Ask your question again. If you get the same answer the second time, it is more likely to be correct. Always get the name and extension number of the representative you speak with and document the call. Many companies also give you a call reference number in case a similar issue arises later. Keep all of this information with the patient's financial or insurance record for further reference. In order to refer back to the original call, you will need to give the insurance company that original reference number.

It is important for you to understand each insurance plan's rules and regulations, not only for the patient, but also so you can explain to the provider which plans require a referral or preauthorization for certain procedures. You must also understand (and explain to patients and providers) which plans require patients to utilize specific hospitals, surgical centers, or ancillary providers for labs and X-rays, in order for the services to be covered for payment.

In the United States, the majority of individuals with insurance are covered by group policies, usually through their employers. Some people (often the self-employed) have individual plans. Many others are covered under a government plan (Medicare, Medicaid, TRICARE), which will be discussed later. Still others—over 49.9 million Americans

(according to the US Census Bureau figures for 2010)—have had no health insurance. The federal government through the Obama administration has changed that. On March 23, 2010, President Barack Obama signed into law a massive healthcare overhaul bill known as the Affordable Care Act, or ACA, also referred to as “Obamacare.” The core of this new law, which has taken several years to fully phase in, is the extension of insurance coverage to all Americans who now lack healthcare coverage. Also included in the law are bans on the ability of private insurance carriers to impose lifetime limits on coverage, to deny coverage for preexisting conditions, and to cancel a policy when an insured person becomes ill. Parents in many circumstances can also keep their children covered under the family policy until age 26.

Although ACA has allowed many more Americans to have insurance, many plans have very high deductibles of \$5,000 per year or higher. This means that although patients now have coverage, they will be liable for the cost of their care until their deductible is met. Most people who have high-deductible insurance choose the plan in order to afford the insurance, because premiums are lower. The front office staff will often be responsible for collecting the money patients owe the practice. We will talk more about patient collections in the *Patient Collections and Financial Management* chapter.

Traditionally, every insurance plan issued each of their providers an identification number, similar to the policy number given to each subscriber. Since the advent of HIPAA, although individual insurers may still issue individual ID numbers, every physician and provider who submits a claim to an insurance carrier must now use a specific provider number, known as a National Provider Identifier (NPI), from the Centers for Medicare and Medicaid Services (CMS). During the transition period, while providers obtained their NPIs, certain non-NPI numbers and two-character qualifiers (Table 17-1) were allowed. Now that all providers have an NPI, these non-NPI numbers and their identifiers are used only for certain payers who still require them.

TABLE 17-1 National Uniform Claim Committee (NUCC) Non-NPI Qualifiers	
Qualifier	Description
0B	State License Number
1B	Blue Shield Provider Number
1C	Medicare Provider Number
1D	Medicaid Provider Number
1G	Provider UPIN Number
1H	CHAMPVA Identification Number
E1	Employer’s Identification Number
G2	Provider Commercial Number
LU	Location Number
N5	Provider Plan Network Identification Number
SY	Social Security Number (may not be used for Medicare)
X5	State Industrial Accident Provider Number
ZZ	Provider Taxonomy Number

Fee Schedules and Charges

Physicians establish a list of their usual fees—charged to most of their patients most of the time under typical conditions—for procedures and services they frequently perform. These fees are listed on the office **fee schedule**. Figure 17-1 shows a sample of an office fee schedule.

Fee-for-Service and Managed Care Plans

There are two major types of health plans: traditional fee-for-service plans and managed care plans. **Fee-for-service** plans, the oldest and most expensive type, pay the practitioner a set amount for each service provided based on a fee schedule listed in the insurance policy, and the patient is responsible for the balance. The practitioner who provides the service controls the amount charged for services, but the insurance carrier controls the amount paid for each service.

Managed care organizations (MCOs) control both the financing and delivery of healthcare to policyholders. They enroll policyholders, and they also enroll licensed practitioners and other care providers to provide services for their members at reduced rates. This allows them to control all aspects of the care provided to their members, including the providers their members may see; the fees those providers may charge the MCO; and the copayment charge the provider may bill the patient. Many people who are insured through their employers are covered by some form of managed care plan.

Healthcare providers who enroll with managed care plans are called *participating providers*. They have contracts with the MCOs that stipulate not only the practitioner fees but also the credentials they must have and their responsibilities to the patients and to the MCO itself. Most MCOs also publish their participating providers’ names in booklets and on their website so that policyholders can easily choose a participating provider from the list.

Managed care plans pay their participating providers in one of two ways—by either contracted fees or a fixed prepayment called **capitation**. In most plans, the primary care physician, or PCP, is reimbursed using the capitation method, which is payment of a fixed amount per patient who signs up with a particular PCP. The physician is paid a set amount per month for each patient enrolled in her practice, regardless of whether she sees that patient multiple times during the month or not at all. In addition to these capitated payments, the PCPs will be paid additional contracted fees for certain other services they provide for the patient such as labs and immunizations. In most managed care plans, specialists are paid in a negotiated fee-for-service manner. These contracted rates are usually less than those paid by private fee-for-service plans, but more than those paid by the government health plans. Providers and insurance carriers negotiate these contracts and fee schedules on a periodic basis.

As shown in Figure 17-2, more than half of all health plans are **preferred provider organizations (PPOs)**. A PPO is a managed care plan that establishes a network of providers to perform services for plan members. In exchange for the PPO sending them patients, the practitioners agree to charge discounted fees. In most PPOs, plan members may also choose to receive care from providers outside the network. However, if they do, they are responsible for paying a higher percentage of the charges for

Distribution of Health Plan Enrollment for Covered Workers, by Plan Type, 1988–2013

NOTE: Information was not obtained for POS plans in 1988. A portion of the change in plan type enrollment for 2005 is likely attributable to incorporating more recent Census Bureau estimates of the number of state and local government workers and removing federal workers from the weights. See the Survey Design and Methods section from the 2005 Kaiser/HRET Survey of Employer-Sponsored Health Benefits for additional information.

SOURCE: Kaiser/HRET Survey of Employer-Sponsored Health Benefits, 1999–2014; KPMG Survey of Employer-Sponsored Health Benefits, 1993, 1996; The Health Insurance Association of America (HIAA), 1988.

FIGURE 17-2 Distribution of health plan enrollment for covered workers, by plan type, 1988–2013.

these visits and may be subject to a deductible they would not be responsible for if they saw in-network providers.

Another common type of managed care system, covering 14% of those with private healthcare insurance, is a **health maintenance organization (HMO)**. Physicians with HMO contracts are often paid a capitated rate, or they may be employees of the organization who are paid salaries. Patients who enroll in an HMO pay yearly premiums to maintain the insurance coverage and usually also pay a copayment, often \$15 to \$35, at the time of the office visit. No other fees are required for any covered service a member needs. In HMOs, patients must usually choose from a specific group of healthcare providers. If they seek services from a provider who is not in the health plan, the HMO does not pay for the care. Patients also pay for excluded services—those not included in the plan as covered services.

An important aspect of cost control used by managed care organizations is a process known as **utilization review (UR)**. In this process, medical peers who have training similar to that of the practitioner providing the medical care review individual cases to be sure that all services provided were medically necessary and that there was appropriate use of medical resources. Should UR find that services were not medically necessary, payment can be denied at a loss to the practice, as the patient cannot be billed for services considered not medically necessary.

Commercial Payers

Blue Cross and Blue Shield Although many people think Blue Cross and Blue Shield (BCBS) is one large corporation, it is actually a nationwide federation of nonprofit and for-profit service organizations that provide prepaid healthcare services to BCBS subscribers. Each state's organization operates under its own state laws, and covered services and benefits for BCBS plans can vary greatly from state to state and plan to plan.

Private Commercial Carriers There are too many private commercial payers to list, and rules and regulations among the carriers vary as much as the covered services and the fees allowed for those covered services. Aetna, CIGNA, and Travelers are common commercial carriers.

In addition to health insurance, two other special types of insurance—liability insurance and disability insurance—are available to cover medical expenses. *Liability insurance*, also known as personal injury insurance, covers injuries that were caused by the insured or that occurred on the insured's property. If an individual (or company) has liability insurance included in a home, business, automobile, or health insurance policy, the injured person can claim benefits under the insured's policy. To obtain specific details about the individual policy's coverage, contact the liability insurance company.

Disability insurance covers people who are injured or disabled for nonwork reasons. It may be offered by an employer to employees at employee expense, or provided free of charge by an employer for its employees. Disability insurance may also be purchased privately by self-employed individuals. Disability insurance is not health insurance and does not cover medical expenses. When an insured person cannot work, and can provide the insurance carrier with documentation as to the medical reason he or she cannot work, the insurance

company pays the insured a prearranged monthly amount to assist with the insured's normal daily expenses. There are two types of disability policies. Short-term policies offer coverage for shorter periods of time, usually 7 (consecutive) days to 6 months, and long-term disability policies may last for 1 year or more depending on policy stipulations.

Patient Centered Medical Home

Providers, insurers, patients, and US politicians continue to search for a better way to provide healthcare for all citizens. One model that has shown promise is the **patient centered medical home**, also known as *primary care medical home (PCMH)*. The premise behind the patient centered medical home is to change the organization and delivery of primary care in America.

According to the Agency for Healthcare Research and Quality (AHRQ), the five functions and attributes of the PCMH are as outlined here.

- **Comprehensive care.** Comprehensive care is the goal and charge of the medical team responsible for meeting the majority of the patient's physical and mental health needs. These services include preventive care and wellness, as well as acute and chronic care. The team of providers involved might include any or all of the following practitioners: advanced practice nurses (APRN), physician assistants (PA), physicians, nurses, pharmacists, nutritionists, social workers, educators, and care coordinators. These providers may be in physical, "brick and mortar" locations or connected in a virtual fashion to link patients with providers and care within their communities.
- **Patient centered.** The goal of the PCMH is primary care oriented toward the whole person. The practitioners partner with the patient and the family with understanding and respect for each patient's unique needs, culture, values, and preferences. The patient and family are encouraged to be partners in the patient's care and care decisions.
- **Coordinated care.** The PCMH team coordinates patient care across the spectrum of healthcare, including specialty care, hospitals, home healthcare, community services, and support. The coordination will be particularly critical during transition periods such as before, during, and after hospital discharge. Open and clear communication among all care providers and the patient and family is considered vital and is at the core of the patient centered medical home model.
- **Accessible service.** A significant goal of PCMH is accessible services with shorter wait times, particularly when the need is urgent. PCMH includes longer "in person" office hours and 24/7 telephone and electronic access to members of the healthcare team, including alternate communication methods such as e-mail and telemedicine.
- **Quality and safety.** The patient centered medical home concept is committed to quality and continuous quality improvement by engaging in evidence-based medicine and clinical decision support tools to guide decision making with patients and families. The patient experience is measured and improved by gauging patient experience and satisfaction. Transparency of satisfaction is included by public sharing of safety and data improvement activities.

Many legislatures, providers, patients, and even insurers recognize that in many ways the healthcare system in the United States is “broken.” Ideas and healthcare models such as the patient centered medical home is at the forefront of the movement to provide healthcare for everyone. For more information on PCMH, visit <http://www.pcmh.ahrq.gov>.

▶ Government Plans

LO 17.3

Government plans are generally designed to offer healthcare to retirees, low-income and disadvantaged individuals, and active or retired military personnel and their families. Some of these plans maintain many of the features of managed care plans.

Medicare

The largest federal program providing healthcare is *Medicare*, which provides health insurance for citizens aged 65 and older. Other people who are eligible for Medicare include people under the age of 65 who are dependent widows aged 50 to 65, the disabled, the blind, and workers of any age who have chronic kidney disease requiring dialysis or end-stage renal disease (ESRD) requiring transplant. Kidney donors are also eligible for Medicare. The Medicare program is managed by CMS. Two websites are available to obtain more information regarding Medicare: <http://www.medicare.gov> (supplies patients and beneficiaries with information) and <http://www.cms.gov> (includes provider and claims information for both Medicare and Medicaid). Medicare is divided into two main parts—Part A and Part B.

Part A Medicare Part A is the hospital benefit, which is billed by hospitals (or other healthcare facilities) and financed through contributions collected from the Federal Insurance Contributions Act (FICA) tax on income earned by workers and the self-employed. Currently, the FICA tax for workers is 6.2% (with the employer matching the 6.2%, for a total of 12.4%) and 12.4% for the self-employed up to a wage maximum of \$110,000. You will learn more about FICA tax deductions in the *Practice Management* chapter. Medicare Part A pays most of the costs for the following individuals:

- Patients who are admitted as inpatients for up to the 90-day benefit period. A benefit period begins the day a patient is admitted to the hospital and ends when that patient has not been hospitalized or placed in a skilled nursing facility for a period of 60 continuous days after discharge.

The 90-day benefit period is divided into two parts. The initial benefit period is 60 days; after the patient pays a deductible, hospital coverage is at 100%. After the first 60 days, the patient enters into a 30-day period called coinsurance days. During this 30-day period, the patient must pay an additional per-day payment, or coinsurance. If the hospital stay extends beyond the 30 coinsurance days, the patient may use up to 60 lifetime reserve days, which also include a per-day charge. It is important to note these 60 lifetime reserve days are not renewable. Once they are used up during the patient’s lifetime, they are no longer available. If the patient is admitted to the hospital again for longer than 90

days, after the reserve days are exhausted, the patient will be responsible for all charges after the 90th day.

- A patient who has been admitted to a skilled nursing facility (SNF) after inpatient hospitalization. Coverage is for no more than 100 days in each benefit period—usually 1 calendar year.
- A patient who is receiving medical care at home
- A patient receiving hospice care either at home or in a hospice facility. Terminally ill patients with a prognosis (prediction) of 6 months or less to live are eligible for hospice care. Hospice programs provide *palliative care*, including pain relief and support for terminal patients and their family members.
- A patient who requires psychiatric treatment. Currently, Medicare covers only 190 days of psychiatric hospitalization in a patient’s lifetime.
- A patient who requires respite care. In certain clearly and narrowly defined circumstances, Medicare provides for a respite, or short break, for the person who cares for a terminally ill patient at home. The terminally ill patient is moved to a care facility for the respite.

Anyone who receives Social Security benefits is automatically enrolled in Part A and does not have to pay a premium. Individuals aged 65 or older who are not eligible for Social Security benefits may enroll in Part A, but they must pay premiums for the coverage.

Part B Medicare Part B covers a portion (usually 80%) of the allowed charges for a wide range of outpatient procedures and supplies. For example, it covers licensed and credentialed provider services, outpatient hospital services, diagnostic tests, clinical laboratory services, and outpatient physical and speech therapy as long as these services are considered medically necessary. Individuals entitled to Part A benefits automatically qualify for Part B benefits. In addition, US citizens and permanent residents over the age of 65 are also eligible. Part B is a voluntary program; eligible persons may or may not take part in it. However, those desiring Part B must enroll because coverage is not automatic. The Medicare beneficiary has a 6-month time frame to apply, beginning 3 months prior to his 65th birthday until 3 months after it. If the deadline is missed, the beneficiary must wait until open enrollment, which is from January to March 31 of each year. If the Medicare B enrollment takes place more than 12 months after the initial enrollment period, there is a permanent 10% increase in the premium for each year the beneficiary was eligible to enroll but did not. Unlike Part A, Part B coverage is not premium free. Starting in 2007, the Medicare Part B premium is based on the beneficiary’s income. The standard premium in 2015 of \$104.90/month has not increased since 2013. This standard amount may increase or decrease depending on the individual’s income, so it is important to check the CMS website yearly for accurate information. Each Medicare enrollee receives a health insurance card that lists the beneficiary’s name, sex, effective dates for Part A and Part B coverage, and Medicare number. CMS assigns the Medicare number, which

TABLE 17-2 Comparison of Medicare A and B Premiums, Deductibles, and Benefits

Medicare Plan	Premium	Deductible	Benefit Period	Patient Coinsurance
Medicare A	None	Yes/per admission		
Hospitalization			Days 1–60	\$0—Medicare pays 100%
			Days 61–90	\$315/day
			Days 91–150 (includes 60 lifetime reserve days)	\$630/day
			After 150 days	100%—no Medicare benefit
Skilled nursing facility (patient must have been hospitalized at least 3 days and be admitted to approved skilled nursing facility within 30 days of hospital discharge)			Days 1–20	\$0—Medicare pays 100%
			Days 21–100	\$157.50
			After 100 days	100%—no Medicare benefit
Home healthcare (includes part time home nursing and aide services, durable medical equipment [DME], and supplies)			Unlimited, as long as Medicare criteria are met and services are <i>medically necessary</i>	\$0 for home health service 20% of allowed charges for DME
Hospice services (palliative care for the terminally ill and family members)			Patient elects hospice care and physician certifies need for hospice	\$0 except for outpatient medication and inpatient hospital care
Blood				First 3 pints per year
Medicare B (Outpatient Medical)	Yes	Yes/per year	January 1–December 31	20% of approved charges
Outpatient mental health				50% of approved charges
Outpatient laboratory				\$0 of approved charges (Medicare pays 100%)
Home healthcare (includes part time home health nursing and aides, physical/occupational/speech therapies, DME supplies and services)				\$0 for home care (Medicare covers 100%) 20% for DME
Blood				First 3 pints and 20% of approved charges
Ambulatory surgery				20% of predetermined charge after deductible

usually consists of the Social Security number followed by an alpha or alphanumeric suffix. The suffix indicates how the beneficiary is eligible for Medicare. The three most common suffixes are as follows:

- Suffix “A” is attached to the patient’s own Social Security number because it was her income making eligible for Medicare.
- Suffix “B” is attached to the Social Security number of the spouse because the patient (who usually has not paid enough into the system to be eligible under his own number) is eligible because of his spouse’s contributions.
- Suffix “D” is attached to the Social Security number of a spouse who is deceased. This benefit type has commonly been known as “widows’ benefits.”

See Table 17-2 for an overview of Medicare A and B premium, deductible, and benefit differences as of 2015.

Medicare Part C and Part D Medicare Part C, introduced in 1997, provides several plan choices for individuals called Medicare Advantage plans. These include PPOs,

HMOs, private fee-for-service (PFFS) plans, special needs plans, and Medicare medical savings account (MSA) plans. The MSA plan started in 2007.

In 2003, the legislature passed the Medicare Part D prescription drug plan, and coverage began January 1, 2006. All Medicare beneficiaries can enroll in a prescription drug plan through the Medicare Prescription Drug plan, Medicare Advantage, or other Medicare plans, and through employers and unions. Figure 17-3 is the Medicare Part D coverage determination request form.

Medicare Plan Options Medicare beneficiaries can choose from a number of insurance plan options, including fee-for-service and Medicare Advantage plans consisting of different types of managed care plans.

Fee-for-Service—the Original Medicare Plan The Medicare fee-for-service plan allows the beneficiary to choose any licensed practitioner certified by Medicare. Each time the beneficiary receives outpatient services, a fee is billable. Medicare generally pays part of this fee and part is due from the beneficiary. Once the patient meets the annual deductible, if

FIGURE 17-3 Medicare Part D coverage determination request form.

the patient sees a participating provider, Medicare pays 80% of approved charges directly to the provider and the patient is responsible for the remaining 20% and any disallowed charges. Providers who accept the Medicare-allowed charge as payment in full are known as those who “accept assignment.” These

providers cannot charge the patient more than this allowed charge, regardless of the original fee. A Medicare beneficiary may choose a provider who does not participate in the Medicare program and who does not accept assignment. In that case, the provider does not have to accept the Medicare allowable as

payment in full and may charge the patient up to the “limiting charge”—usually defined as 115% of the nonparticipating allowable fee—as described by Medicare. This usually results in an increased out-of-pocket expense for the patient.

To help with the responsibility of the 20% coinsurance, individuals enrolled in the Original Medicare B Plan often buy additional insurance called a *Medigap* plan. While coverage of these plans varies from policy to policy, the core benefits common to all Medigap plans include coverage of the patient’s Part B deductible and the 20% balance of all charges that are allowed by Medicare. However, if Medicare does not pay a claim, Medigap is not required to pay the claim, either. Although private insurance carriers offer Medigap plans, federal and state laws regulate coverage and standards. As for any insurance, the policyholder pays a monthly premium for Medigap insurance policies. A number of different options, labeled A through J, are available. Monthly premiums vary widely across the different plan levels as well as within a single plan level, depending on the insurance company selected. In 2009, CMS changed how claims were processed through Medicare contracting reform. At the forefront of these changes was the creation of Medicare Administrative Contractor (MAC) jurisdictions for claims processing. Table 17-3 outlines the jurisdictions for Medicare medical claims and the states contained within each. Durable medical equipment (DME) claims are separated from medical claims and are submitted to MACs set up specifically for DME. More information on all Medicare MACs can be found at <http://www.cms.gov/Medicare/Medicare-Contracting/Medicare-Administrative-Contractors/MACJurisdictions.html>.

TABLE 17-3 Medicare MAC Jurisdictions for Medical Claims	
A/B MAC Jurisdiction Number	States Included in Each Jurisdiction
E	American Samoa, California, Guam, Hawaii, Nevada, and Northern Mariana Islands
F	Alaska, Idaho, Oregon, Washington, Arizona, Montana, North Dakota, South Dakota, Utah, and Wyoming

6	Illinois, Minnesota, and Wisconsin
8	Indiana and Michigan
N	Florida, Puerto Rico, and US Virgin Islands
J	Alabama, Georgia, and Tennessee
11	North Carolina, South Carolina, Virginia, and West Virginia
L	Delaware, District of Columbia, Maryland, New Jersey, and Pennsylvania
K	Connecticut, New York, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont
15	Kentucky and Ohio

Medicare Managed Care Plans Instead of the traditional Medicare A and B plans, many Medicare beneficiaries choose from a variety of managed care plans approved by CMS for their healthcare coverage. Medicare managed care plans charge a monthly premium and a small copayment for each office visit, but not a deductible. Like private payer managed care plans, Medicare managed care plans often require patients to select a primary care physician (PCP), who oversees and manages the patient’s medical care through *referrals*. Usually, patients are also required to use a specific network of providers, hospitals, and other facilities. Some plans allow members the option of receiving services from providers outside the network, but the member’s portion of the charges will be higher. Medicare MCOs offer coverage for services not reimbursed in the Original Medicare Plan, like physical examinations and immunizations.

Medicare Preferred Provider Organization Plan In the Medicare preferred provider organization (PPO) plan, patients pay less when they use doctors within a network, but they may choose to go outside the network for additional costs, such as a higher copayment or higher coinsurance. Patients do not need a PCP, and referrals are not required.

Medicare Private Fee-for-Service Plan Under a Medicare private fee-for-service plan, patients receive services from the provider they choose as long as Medicare has approved the provider or facility. This plan is operated by private insurance companies that have a contract with Medicare to provide services to Medicare beneficiaries. The private insurance company sets its own rates for services, and physicians are allowed to bill patients the amount of the charge not covered by the plan. A copayment may or may not be required.

Recovery Audit Contractor Program In 2008, CMS announced aggressive new steps to find and prevent waste, fraud, and abuse in Medicare. Since then, CMS has been working closely with beneficiaries and providers, consolidating its fraud detection efforts, strengthening its oversight of medical equipment suppliers and home health agencies, and launching the national recovery audit contractor (RAC) program. Contracts have been awarded to four permanent RACs, each of which audits one-fourth of the country. The RACs are designed to guard the Medicare Trust Fund by fighting fraud, waste, and abuse in the Medicare program. The recovery audit program’s goal is to identify improper payments—overpayments or underpayments—made on claims of healthcare services provided to Medicare beneficiaries. Overpayments can occur when healthcare providers submit claims that do not meet Medicare’s coding or medical necessity policies. Underpayments can occur when healthcare providers submit claims for a simple procedure but the medical record reveals that a more complicated procedure was actually performed. Healthcare providers subject to review by the RACs include hospitals, physician practices, nursing homes, home health agencies, durable medical equipment suppliers, and any other provider or supplier that bills Medicare Parts A and B. For further information, go to <http://www.cms.hhs.gov> and search for the recovery audit program.

Medicaid

Medicaid, also run by CMS, is a health-benefit program designed for low-income, blind, or disabled patients; needy families; foster children; and children born with birth defects. Medicaid is a health cost assistance program, *not* an insurance program. The difference between an assistance program and a health insurance program is this: The government provides assistance programs to the recipient (or patient) at no charge, while the subscriber (or patient) pays for health insurance programs through premiums. The federal government provides funds to all 50 states to administer Medicaid (covering specified mandated services), and then each state adds its own funds (for additional optional services). Every state has a program to assist with medical expenses for citizens who meet its qualifications. Such programs may have different names and slightly different rules, but they provide basically the same assistance:

- Licensed, credentialed practitioner services
- Emergency services
- Laboratory services and X-rays
- Skilled nursing facility (SNF) care
- Early diagnostic screening and treatment for minors (aged 21 and younger)
- Vaccines for children

Accepting Assignment Any licensed practitioner who agrees to treat Medicaid patients also agrees to accept the established Medicaid payment for covered services as payment in full. Recall that this agreement is called accepting assignment. If the practitioner's fee is higher than the Medicaid payment, the patient cannot be billed for the difference. For services that Medicaid does *not* cover, however, the provider may bill the patient directly. Note that, as a federally funded assistance program, Medicaid is known as the *payer of last resort*, meaning that if both a private insurance plan and Medicaid cover a patient, the private plan must be billed before Medicaid. It is considered fraud to knowingly bill Medicaid if another insurance company also provides medical coverage for a patient.

Dual Coverage, or Medi/Medi Elderly or disabled patients who have Medicare and who cannot pay the difference between the charges submitted and the Medicare payment may qualify for Medicare and Medicaid. Formerly known as Medi/Medi, this is now more commonly known as **dual coverage**. In such cases, Medicare is the primary payer and Medicaid is the secondary payer. The patient with dual coverage is never billed for a balance unless a noncovered service is provided (and the patient is notified in advance in writing of this fact) or Medicare/ Medicaid states that the patient may be billed.

State Guidelines Medicaid benefits can and often do vary greatly from state to state. Eligibility is based on how much income the patient reported for the previous month. It is important to understand the Medicaid guidelines in your state

so that the Medicaid reimbursement to your office is prompt and trouble free. Here are some suggestions:

- Do not submit a claim to Medicaid without verification of Medicaid benefit eligibility. Doing so may constitute fraud. You should contact Medicaid to verify eligibility every time the patient is seen in the office.
- Ensure that the provider signs all claims, unless claims are submitted electronically (the provider's signature is kept on file). Send the completed and signed claims to the state's Medicaid-approved contractor (which pays on behalf of the state) or to the state department that administers Medicaid (for example, the state department of social services or public health). Check with your state Medicaid office if you are unsure where to send the claim.
- Unless the patient has a medical emergency, Medicaid often requires authorization before services are performed, which must be obtained from the state Medicaid office in advance. If the patient is seen on an emergency basis, it is not unusual for the Medicaid office to require that they be notified as soon as possible of any emergency treatment given to the patient. Not meeting these requirements can result in claim denial.
- Check the time limit (deadline) on claim submission with your state's Medicaid office. It can be as short as 2 months or as long as 1 year from the date of service. Claims submitted after this time limit will be denied or rejected. Any charges denied by Medicaid because they were submitted after the time limit must be adjusted from the account. The patient cannot be billed for the charges. The practice is expected to absorb the loss of income when charges are not submitted within the time frame allowed to be considered for payment.
- Treat Medicaid patients with the same professionalism and courtesy you extend to other private-pay patients. Simply because a patient qualifies for Medicaid assistance does not mean the patient is in any way inferior to those with private insurance.

TRICARE and CHAMPVA

The US government provides healthcare benefits to families of current military personnel, retired military personnel, and veterans through the TRICARE and CHAMPVA programs. TRICARE and CHAMPVA patients are most commonly seen at a military-related facility.

Run by the Defense Department, TRICARE (formerly known as Civilian Health and Medical Program for Uniformed Services, or CHAMPUS) is not a health insurance plan. Rather, it is a healthcare benefit for families of uniformed personnel and retirees from the Army, Navy, Marines, Air Force, Coast Guard, Public Health Service, and National Oceanic and Atmospheric Administration (Figure 17-4). TRICARE offers families three choices of healthcare benefits:

1. TRICARE Prime, a health maintenance organization
2. TRICARE Extra, a managed care network of healthcare providers families can use on a case-by-case basis without a required enrollment
3. TRICARE Standard, a fee-for-service plan

FIGURE 17-4 TRICARE covers healthcare services for family members of active military personnel as well as retirees.

© Ariel Skelley/Getty Images RF

Another program, TRICARE for Life, is aimed at Medicare-eligible military retirees and Medicare-eligible family members. TRICARE for Life offers the opportunity to receive healthcare at a military treatment facility to individuals aged 65 and older who are eligible for both Medicare and TRICARE.

Under TRICARE for Life, enrollees in TRICARE who are aged 65 and older can continue to obtain medical services at military hospitals and clinics as they did before they turned 65. As a general rule, TRICARE for Life acts as a secondary payer to Medicare; Medicare pays first and TRICARE pays the remaining out-of-pocket expenses.

CHAMPVA is the acronym for Civilian Health and Medical Program of the Veterans Administration and it covers the expenses of the families (dependent spouses and children) of veterans with total, permanent, service-connected disabilities. It also covers surviving spouses and dependent children of veterans who died in the line of duty or as a result of service-connected disabilities.

TRICARE and CHAMPVA Eligibility As with any healthcare plan, you must verify TRICARE eligibility. All TRICARE patients should have a valid identification card. To receive TRICARE benefits, eligible individuals must be enrolled in the Defense Enrollment Eligibility Reporting System (DEERS)—a computer database.

Eligibility for CHAMPVA is determined by the nearest Veterans Affairs medical center. Contact this center if any questions arise. Patients can choose the doctor they wish after CHAMPVA eligibility is confirmed.

Unlike Medicaid-participating providers who must accept all Medicaid patients once they agree to participate, TRICARE- and CHAMPVA-participating providers have the option of deciding whether to accept patients on a case-by-case basis. Make sure you know the policy of the providers in your office regarding this issue.

State Children's Health Insurance Plan

Originally enacted in 1997, the State Children's Health Insurance Plan (SCHIP) was reenacted in 2009 and is now

more commonly known simply as CHIP. The plan allows states to provide health coverage to uninsured children in families whose incomes are too high to qualify for Medicaid but too low to afford private insurance. States have raised eligibility levels to provide coverage to more families. Check your state's requirements for this plan through its website.

Workers' Compensation

Workers' compensation insurance covers employment-related accidents and diseases. Federal law requires employers to purchase and maintain a certain minimum amount of workers' compensation insurance for their employees. Workers' compensation laws vary from state to state, but, in most states, this insurance includes these benefits:

- Basic medical treatment
- A weekly amount paid to the patient for a temporary disability, which compensates workers for loss of income until they can return to work
- A weekly or monthly sum paid to the patient for a permanent disability
- Rehabilitation costs to restore an employee's ability to work again
- Death benefits for survivors

Not all medical practices accept workers' compensation cases. Every procedure or treatment deemed necessary must be approved in order for payment to be made. Prior to treating a patient who states her care is related to a work-related illness or injury, call the employer to verify this information. When contacting the employer, speak to the office manager or human resources department. Be sure to get the name and extension of the person who verifies information for you. Give the verifier the patient's name and ask if the treatment is to be covered by workers' compensation. If the answer is yes, be sure to get the date of the original injury or illness and a brief description of the event causing the illness or ask the verifier if a workers' compensation case has been opened by the employer with the insurance carrier and obtain the case number. If a case has not been opened, ask the employer to report the incident. Until this report—known as the Employer's First Report of Illness or Injury—is received from the employer, the insurance carrier will not open a case, which means you will not be paid. Obtain the name, address, and phone number of the insurance carrier and carefully document this information. After completing the call to the employer and receiving permission to treat the patient, call the insurance carrier and verify that the employer has an active workers' compensation policy with them.

Records management of workers' compensation varies by state. If you see a patient privately and then she comes to you for a work-related illness or injury, be sure to keep the medical and financial records of the private care separate from the records of the care related to the workers' compensation case. Because the employer and insurer have contracted with the practitioner to provide care, they have the right to see all treatment and applicable financial records related to the workers' compensation claim without patient consent. It is up to the office to maintain the patient's confidentiality related to any

care provided to her that is not related to the workers' compensation claim; keeping separate files makes it easier to do so.

Procedure 17-1, found at the end of the chapter, outlines the steps for verifying a patient's workers' compensation coverage.

► Payer Payment Systems

LO 17.4

As stated earlier, many traditional indemnity payers and even some MCOs base their reimbursement for medical care on fee schedules, but some payers, including Medicare, use differing formulas and processes for calculating provider payments. Let's look at some of these methods.

Medicare Payment System: RBRVS

Third-party payers set the fees they are willing to pay providers; these fees are often less than the physician's fee schedule. Most payers base their fees on the amounts Medicare allows because the Medicare method of fee setting takes into account important factors other than only the usual fees.

The payment system Medicare uses is called the **resource-based relative value scale (RBRVS)**. The RBRVS establishes the relative value units for services, replacing the providers' consensus on fees (the "usual" or historical charges) with amounts based on resources (what each service really costs to provide).

An RBRVS fee has three parts and uses the formula $RVU \times GAF \times CF$. Listed below is an explanation for each part of this formula:

1. The national uniform relative value unit (RVU). The relative value of a procedure is based on three cost elements: the physician's work, the practice cost (overhead), and the cost of malpractice insurance. For example, the relative value unit for a simple office visit—say, to administer a flu shot—is much lower than the relative value for a complicated encounter, like planning a patient's treatment of uncontrolled diabetes.
2. A geographic adjustment factor (GAF). A GAF is used to adjust each relative value to reflect a geographic area's relative costs, such as office rent and utilities.
3. A nationally uniform conversion factor (CF). A uniform CF is a dollar amount used to multiply the relative values to produce a payment amount. It is used by Medicare to make adjustments according to changes in the cost-of-living index.

When RBRVS fees are used, providers receive considerably lower payments than when usual fees are used. Each part of the RBRVS—the relative values, the geographic adjustment, and the conversion factor—is updated each year by CMS. The Medicare fee schedule (MFS) is also published each year by CMS in the *Federal Register* at <http://www.cms.gov/>.

Payment Methods

Most third-party payers use one of three methods for reimbursing providers:

1. Allowed charges
2. Contracted fee schedule
3. Capitation

Allowed Charges Most payers set an **allowed charge**—the maximum amount the payer will pay any provider—for each procedure or service. The term *allowed charge* has many equivalent terms, including *maximum allowable fee*, *maximum charge*, *allowed amount*, *allowed fee*, and *allowable charge*.

The provider's usual charge is often greater than a plan's allowed charge. If the provider participates in the plan, only the allowed charge will be the basis for the payer's payment. The plan's contract with the provider governs whether the provider is permitted to bill a patient for the part of a usual charge the payer does not cover. Billing a patient for the difference between a higher usual fee and a lower allowed charge is called *balance billing*. Under most contracts, participating providers may not balance bill the patient. Instead, the provider must write off the difference between the fee charged and the allowed charge. The common term for this write-off is *adjustment*.

For example, Medicare-participating providers may not collect any amount greater than the Medicare-allowed charge. Medicare is responsible for paying 80% of this allowed charge after patients have met their annual deductible, and patients (or their secondary insurance) are responsible for the other 20%.

Here is an example of a Medicare billing. A Medicare-participating provider reports a charge of \$200 for a service and the Medicare-allowed charge is \$84. The provider must write off the difference between the two charges. The patient is responsible for 20% of the allowed charge, not of the provider's usual charge:

Provider's usual fee:	\$200.00
Medicare-allowed charge:	\$ 84.00
Medicare pays 80% of allowed charge:	\$ 67.20
Patient pays 20% of allowed charge:	\$ 16.80
Adjustment (\$200 – \$84):	\$116.00

The total the provider can collect is \$84.00. The provider must write off the difference between the usual fee and the allowed charge, or \$116.00 in this example. Remember, in this example, it is assumed the patient has paid her annual deductible; otherwise, her coinsurance would be higher.

Contracted Fee Schedule Some payers, particularly PPOs, establish fixed fee schedules with their participating physicians. The plan's terms determine what percentage of the charges, if any, the patient owes and what percentage the payer covers. Participating providers can typically bill patients their usual charges for procedures and services not covered by the plan.

Capitation The fixed prepayment for each plan member in capitation contracts is determined by the managed care plan that initiates contracts with providers. The plan's contract with the provider lists the services and procedures covered by the capitation rate. For example, a typical contract with a primary care provider might include the following services:

- Preventive care, including well-child care, adult physical exams, gynecologic exams, eye exams, and hearing exams
- Counseling and telephone calls
- Office visits

- Medical care, including medical care services such as therapeutic injections and immunizations, allergy immunotherapy, electrocardiograms, and pulmonary function tests
- The local treatment of first-degree burns, the application of dressings, suture removal, the excision of small skin lesions, and the removal of foreign bodies or cerumen from the external ear

For instance, HMO B has a contract with Dr. Williams stating that her capitation rate is \$150.00/month per patient. For each patient with HMO B who chooses Dr. Williams to be his or her PCP, Dr. Williams will receive \$150/month, whether she sees each patient that month or not. When she does see a patient for, let's say an office visit and an EKG, she will receive the \$150 and the patient's copay but no other reimbursement from HMO B, regardless of what her actual charges might be.

If a provider and patient decide a service is required that is not covered by the managed care plan, the provider often must notify the patient in advance that a service is not covered and state the fee for which the patient will be responsible. It is always a good idea to have the patient sign a waiver of liability—a notification in writing that he will be responsible for any noncovered charges, and the expected amount, prior to performing any such procedure.

Calculating Patient Charges

In addition to premiums, patients may be obligated to pay deductibles, copayments, coinsurance, excluded and over-limit services, and balance billing (only if allowed by the insurance plan).

All payers require patients to pay for excluded (noncovered) services. Providers generally can charge their usual fees for these services. Likewise, in managed care plans that set limits on the annual (or other period) usage of covered services, patients are responsible for usage beyond the allowed number. For example, if one preventive physical examination is permitted annually, additional preventive examinations are denied by the payer and become the patient's responsibility.

Communicating with Patients About Charges

When patients have office visits with a provider who participates in the plan under which they have coverage, like a Medicare-participating (PAR) provider, they generally sign an *assignment of benefits* statement. With this statement, the provider agrees to prepare and submit healthcare claim forms for patients, to receive payments directly from the payers, and to accept a payer's allowed charge. Patients are billed for charges that payers deny or do not pay. When patients have encounters with nonparticipating (nonPAR) providers, the procedure is usually different. To avoid the difficulty of collecting patient payments at a later date, practices may require the patient to either (1) assign benefits directly to the practice or (2) pay in full at the time of services.

Patients often call the office regarding statements they receive from the practice. For example, suppose a patient receives a bill for \$100 from your practice. She calls to say that she has paid her deductible for the year, so her insurance company should have paid 80% of the charges. You call the patient's insurance company and, after confirming coverage,

learn that her deductible increased to \$200 this year and she still has to pay \$100 to meet her deductible. If she pays the \$100 bill in full, her deductible will then be met. Alternatively, many insurance carrier websites now include a calculator that, based on the CPT (procedure) code and ICD (diagnosis) codes you enter, will calculate the payment to expect from the insurer, and the probable patient balance, as well as give you information as to the deductible amount and balance still owed by the patient. You now can call the patient to explain these facts to her.

To estimate patients' responsibility for charges, you should check with the payer to find out

- The patient's deductible amount and how much of the deductible is still owed, any coinsurance or copayment amounts that are the patient's responsibility, and whether the planned service or treatment is a covered service on the patient's plan.
- The payer's allowed charges for the services the provider anticipates providing. This will allow you to anticipate how much the payer will be paying the office for the service provided.

Patients should always be reminded of their financial obligations under their plans, including their obligation to pay charges that were denied by the insurance provider, according to practice procedures. The practice's financial policy regarding payment for services is usually either displayed on the reception area wall or included in the new patient information packet. The policy should explain what payments are required of the patient and when payment is due. For example, the policy may state the following:

- For unassigned claims: Payment for the practitioner's services is expected at the time of your appointment, unless you have made other arrangements with our practice manager.
- For assigned claims: After your insurance company processes your claim, you will be billed for any amount that is your responsibility. You are responsible for any part of the charges that are denied or not paid by the carrier. Payment for these charges is expected in full within 30 days of the statement date, unless prior arrangements have been made.
- For managed care members: Copayments must be paid prior to seeing the practitioner.

It is also good practice to notify patients in advance of the probable cost of procedures that are not going to be covered by their plan. For example, some private plans as well as Medicare do not pay for services like chiropractic care and some preventive services. Patients should be asked to sign a document known as a waiver of liability, which should specify why the service will not be covered and the cost of the procedure, *before* the service is provided.

The Advance Beneficiary Notice of Noncoverage, or ABN (CMS-R-131), is a notice given to Medicare beneficiaries to convey that Medicare is not likely to provide coverage in a specific case (Figure 17-5). "Notifiers" include physicians, providers (including institutional providers like outpatient hospitals), other licensed practitioners, and suppliers paid under Part B (including independent laboratories), and hospice providers and religious nonmedical healthcare institutions (RNHCIs) paid exclusively under Part A.

(A) Notifier(s):

(B) Patient Name:

(C) Identification Number:

ADVANCE BENEFICIARY NOTICE OF NONCOVERAGE (ABN)

NOTE: If Medicare doesn't pay for (D) _____ below, you may have to pay.

Medicare does not pay for everything, even some care that you or your health care provider have good reason to think you need. We expect Medicare may not pay for the (D) _____ below.

(D) _____	(E) Reason Medicare May Not Pay:	(F) Estimated Cost:

WHAT YOU NEED TO DO NOW:

- Read this notice, so you can make an informed decision about your care.
- Ask us any questions that you may have after you finish reading.
- Choose an option below about whether to receive the (D) _____ listed above.
Note: If you choose Option 1 or 2, we may help you to use any other insurance that you might have, but Medicare cannot require us to do this.

(G) OPTIONS:

Check only one box. We cannot choose a box for you.

☐ **OPTION 1.** I want the (D) _____ listed above. You may ask to be paid now, but I also want Medicare billed for an official decision on payment, which is sent to me on a Medicare Summary Notice (MSN). I understand that if Medicare doesn't pay, I am responsible for payment, but **I can appeal to Medicare** by following the directions on the MSN. If Medicare does pay, you will refund any payments I made to you, less co-pays or deductibles.

☐ **OPTION 2.** I want the (D) _____ listed above, but do not bill Medicare. You may ask to be paid now as I am responsible for payment. **I cannot appeal if Medicare is not billed.**

☐ **OPTION 3.** I don't want the (D) _____ listed above. I understand with this choice I am **not** responsible for payment, and **I cannot appeal to see if Medicare would pay.**

(H) Additional Information:

This notice gives our opinion, not an official Medicare decision. If you have other questions on this notice or Medicare billing, call **1-800-MEDICARE** (1-800-633-4227/TTY: 1-877-486-2048).

Signing below means that you have received and understand this notice. You also receive a copy.

(I) Signature:

(J) Date:

According to the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number. The valid OMB control number for this information collection is 0938-0566. The time required to complete this information collection is estimated to average 7 minutes per response, including the time to review instructions, search existing data resources, gather the data needed, and complete and review the information collection. If you have comments concerning the accuracy of the time estimate or suggestions for improving this form, please write to: CMS, 7500 Security Boulevard, Attn: PRA Reports Clearance Officer, Baltimore, Maryland 21244-1850.

Form CMS-R-131 (03/08)

Form Approved OMB No. 0938-0566

FIGURE 17-5 Advance Beneficiary Notice of Noncoverage.

Source: Centers for Medicare and Medicaid Services.

The ABN must be verbally reviewed with the beneficiary or his or her representative and any questions raised during that review must be answered before it is signed. The ABN must be delivered far enough in advance that the beneficiary or representative has time to consider the options and make an informed

choice. Employees or subcontractors of the notifier may deliver the ABN. ABNs are never required in emergency or urgent care situations. Once all blanks are completed and the form is signed, the beneficiary or representative receives a copy. In all cases, the notifier must retain the original notice on file.

► The Claims Process: An Overview LO 17.5

From the time the patient enters a medical office until the time the insurer pays the practice for that office visit and associated services, several steps are carried out. In brief, the provider's office performs the following services:

- Obtains patient information
- Delivers services to the patient and determines the diagnosis and fee
- Records charges and codes, records payment from the patient, and prepares and submits the healthcare claim
- Reviews the insurer's processing of the claim, remittance advice, and payment

In offices that use electronic billing, medical assistants use the medical billing program to support administrative tasks such as:

- Gathering and recording patient information.
- Verifying patients' insurance coverage.
- Recording procedures and services performed.
- Recording applicable diagnosis and codes for each procedure performed.
- Filing insurance claims and billing patients.
- Reviewing and recording payments.

Billing programs streamline the important process of creating and following up on healthcare claims sent to payers and bills sent to patients. For example, a large medical practice with a group of providers and thousands of patients may receive a phone call from a patient who wants to know the amount owed on an account. With a billing program, the medical assistant can key the first few letters of the patient's last name and the patient's account data will appear on the screen. The outstanding balance can then be communicated to the patient. Billing programs are also used to exchange health information about the practice's patients with health plans. Using *electronic data interchange (EDI)*, similar to the technology behind ATMs, information is sent quickly and securely between the medical practice and the insurance carrier.

Obtaining Patient Information

You will need certain information to be able to complete insurance claims and bill correctly for the patients of the medical practice where you work. This information is usually completed on a patient registration form, as discussed in the *Medical Records and Documentation* chapter.

Basic Facts When the patient first arrives, obtain or verify the following personal information:

- Patient Name (be sure to get the correct spelling of the patient's *legal* name)
- Current home address
- Current home telephone number
- Date of birth (month, day, and the four digits of the year)
- Social Security number
- Next of kin or person to contact in case of an emergency

Obtain the following insurance information:

- Current employer (may be more than one)
- Employer address and telephone number
- Insurance carrier and effective date of coverage
- Insurance group plan number
- Insurance identification number
- Name of subscriber or insured

Obtain the following release signatures:

- Patient's signature on a form authorizing release of information to the insurance carrier
- Patient's signature on a form for assignment of benefits

Eligibility for Services After verifying the patient's personal and insurance information, copy or scan the front and back of the patient's insurance card and obtain the release signatures for inclusion in the patient's financial record. Without the signed authorization to release information, you do not have legal permission to give the insurance carrier information regarding the patient's diagnosis and treatment. And without the assignment of benefits signature, the insurance carrier may send the payment for services to the patient instead of to the office. Also, verify the effective date of insurance coverage; the insurance carrier will not cover services performed before this date. To reduce possible payment problems, remember to inform the patient (in writing) before a service is performed if there is a possibility it may not be covered. By signing the waiver, the patient agrees to accept responsibility for payment, should the insurer not pay for the service. Be sure to retain the original waiver of liability in the patient's financial record and provide a copy to the patient for his records.

Obtaining Prior Authorization In today's medical office, you can often receive prior authorization for anticipated treatment(s) using the insurance carrier's website or over the phone. When calling the insurance company to request prior authorization, have the patient's insurance group number and ID number available, as well as the name, address, phone number, and date of birth for identification purposes. If the patient is covered under someone else's policy and is not the subscriber (insured), you should have the subscriber's name and birth date available and the relationship between the patient and the subscriber. You also will need the name and CPT (procedure) code of the planned procedure and the diagnosis and ICD (diagnosis) code to document medical necessity. A standard prior authorization request form is accepted by many payers for providers who do not have access to electronic technology to obtain prior authorizations. This standard form may be viewed in Figure 17-6 and is accepted by payers either via fax or US mail.

If you call the insurance carrier, ask for or select the prior authorization department. You will likely be speaking to a nurse case manager, who will take down the information regarding the planned procedure. She may give authorization over the phone; if so, carefully write down the authorization number and place it in the patient's chart for further reference. If the insurance plan website gives you the ability to obtain prior authorization online,

BWW Medical Associates, PC
305 Main Street, Port Snead YZ 12345-9876
Tel: 555-654-3210, Fax: 555-987-6543

Please submit any clinical information with this form needed to prove medical necessity. Refer to specific guidelines of each plans medical policy.

¹ Please attach plan specific supporting documentation.

² Note all services listed will be covered by the benefits in member's health plan product.

³ This form does not replace payer specific prior authorization requirements.

FIGURE 17-6 Standardized prior authorization request form from Healthcare Administrative Solutions.

you will complete the authorization form as directed, keying the required information in the fields as requested. The authorization will be given either immediately or within 24 hours, and an authorization will be sent to the office via secure e-mail or USPS. Keep this authorization in the patient's record as proof of receipt. As always, note the authorization number for insertion in block 23 of the CMS-1500 claim form when submitting the procedure for payment. Completion of the CMS-1500 claim form will be covered a bit later in the chapter. Procedure 17-2 at the end of this chapter outlines the steps for obtaining prior authorization.

Coordination of Benefits This refers to legal clauses in insurance policies that prevent payment duplication by restricting insurance company payments to no more than 100% of the covered benefits' cost. In many families, the husband and wife are both wage earners, so they and their children are frequently eligible for health insurance benefits through both employers' plans. In such cases, the two insurance companies coordinate their payments to pay up to 100% of a procedure's cost. A payment of 100% includes the policyholder's deductible and coinsurance or copayment. The *primary* plan is the policy that pays benefits first. The *secondary*, or supplemental, plan pays the deductible and coinsurance or copayment. A policyholder's primary plan is always his employer group health plan. If both a husband and wife have insurance through their employers, the husband's plan is his primary plan and the wife's insurance plan is her primary plan. To determine the primary plan for dependents who are covered by two or more medical plans, in many states, the **birthday rule** is followed. It states that the insurance policy of the policyholder whose birthday comes first in the calendar year is the primary payer for all dependents.

For example, if a husband's birthday is July 14 and his wife's birthday is June 11, following the birthday rule, the wife's insurance plan is the primary payer for their children and the husband's is the secondary payer. If a husband and wife were born on the same day, the policy that has been in effect the longest is the primary payer. Be sure to check with your state's insurance commission to see if the birthday rule applies in your state. Table 17-4 lists widely used coverage guidelines.

Delivering Services to the Patient

To ensure claims processing accuracy, any services the physician or other healthcare team members deliver to the patient in the office must be entered into the patient record, along with referrals to outside licensed practitioners.

Practitioner Services The licensed practitioner who examines the patient notes the patient's symptoms, a diagnosis, a treatment plan (including prescribed medications), and if and when the patient should return for a follow-up visit—all in the

TABLE 17-4	Guidelines for Determining Primary Insurance Coverage
• If the patient has only one policy, it is primary. • If the patient has coverage under two plans, the plan covering the employee for the longest period of time is primary. However, if an active employee has a plan with the present employer and is still covered by a former employer's plan as a retiree or a laid-off employee, the current employer's plan is primary. • If the patient is also covered as a dependent under another insurance policy, the patient's plan is primary. • If an employed patient has coverage under the employer's plan and additional coverage under a government-sponsored plan, the employer's plan is primary. An example of this is a patient enrolled in a PPO through employment who is also covered by Medicare. • If a retired patient is covered by the plan of the spouse's employer and the spouse is still employed, the spouse's plan is primary, even if the retired person has Medicare. • If the patient is a dependent child covered by both parents' plans and the parents are not separated or divorced (or have joint custody of the child), the primary plan is determined by which parent has the first birth date in the calendar year (the birthday rule). • If two or more plans cover the dependent children of separated or divorced parents who do not have joint custody of their children, the children's primary plan is determined in this order: 1. The plan of the custodial parent 2. The plan of the spouse of the custodial parent (if the parent has remarried) 3. The plan of the parent without custody	

medical record. After completing the visit, the practitioner writes the diagnosis, treatment, and sometimes the fee on an encounter form (superbill) (Figure 17-7) or charge slip (Figure 17-8) and instructs the patient to give you the superbill or charge slip before leaving. If the patient has a per-visit copayment, it is collected prior to seeing the practitioner or it is collected at the time the patient is leaving the office.

Medical Coding Today, the superbills used by most offices are preprinted with common procedures and procedure codes. If the charges are not preprinted, there is a space next to each procedure where the current charge may be inserted. For a procedure not listed on the superbill, a blank space at the bottom can be completed with the procedure name, procedure code, and charge. It is critical to verify that the procedure checked off on the form was actually completed by comparing the superbill to the medical record. This step ensures the patient is not inadvertently charged for a procedure that did not take place. Also, be sure the appropriate diagnosis codes are checked off, proving medical necessity for the procedures performed. If your office uses a charge slip instead of a superbill, you will need to translate the procedures listed on the charge slip into charge codes for the insurance carrier. This topic is covered in the *Diagnostic Coding* and *Procedural Coding* chapters.

Referrals and Authorizations for Other Services You may be asked to secure authorization from the insurance company for additional procedures to be performed by one of

your providers at a facility outside of your office, such as a hospital or an ambulatory surgical center. If so, contact the insurance company to explain the reason for the procedure(s) and obtain an authorization number using the previously described procedures. Enter this authorization number in the billing program for inclusion on claims related to this procedure.

Frequently, you will be asked to arrange an appointment for required services, particularly if the practitioner believes they are urgently needed. For example, a physician may send a patient to a specialist's office for evaluation on the same day the patient visits your office. If the patient is a member of a managed care program, prior to making the required appointment, you will need to verify with the insurance plan that the insurance company allows the specialist requested. If so, a referral also may be needed. Depending on the insurance plan and your office capabilities, this referral, like prior authorizations, may be completed in writing or via the insurance plan's website. Without this referral, the specialist's charges may not be covered.

Patient Checkout

As stated earlier, everyone who receives services from a physician in the practice is ultimately responsible for paying the practice for those services. When the patient brings you the superbill at the end of the visit, you may do one or more of the following, depending on your practice's policy:

- Prepare and transmit a healthcare claim on behalf of the patient directly to the insurance company.
- Accept payment from the patient for the full amount. The patient will submit a claim to the insurance carrier for reimbursement. With offices increasingly submitting electronic claims, this option is becoming less common.
- Accept an insurance copayment or coinsurance from the patient and credit the account appropriately.

Specifics on the patient checkout procedure are covered in the *Patient Collections and Financial Management* chapter.

Right now, let's look at the processes involved in completing and submitting a healthcare insurance claim form.

► Preparing and Transmitting the Healthcare Claim

LO 17.6

Healthcare claims are a critical communication between medical offices and payers on behalf of patients. Processing claims is a major task in most offices, and the numbers can be huge. For example, a 40-physician group practice with 55,000 patients served annually typically processes 1,000 claims (or more) daily!

Filing Limits In order for claims to be processed, they must be considered “clean”—free of errors. The first item the insurance carrier is going to review when receiving the claim is the date of service, as the time limit for timely filing begins on this date. Time limits for filing claims vary from company to company. For example, some insurers will not pay a claim unless it is filed within 60 or 90 days from the date of service, while others, like Medicare, allow up to a year for claim submission. In the typical medical practice, claims are transmitted within a few business days after the date of service. Many large practices file claims every day or several times a week to ensure that they never miss the filing deadline.

Electronic Claims Transmission

The electronic claim transaction is the HIPAA Healthcare Claim or Equivalent Encounter Information, commonly referred to as the “HIPAA (or 5010) claim” or simply the “837P claim” (P for physician). Its official name is *X12 837 Health Care Claim*. If you hear someone refer to a “5010 claim,” he is speaking of the current format for electronic claims submission.

As of October 2003, Medicare mandated the X12 837 transaction for all Medicare claims except those from very small practices. Third-party payers may continue to accept paper transactions. Practices that elect to use paper claims

must have two versions of their medical billing software: one to capture the necessary data elements for HIPAA-compliant electronic Medicare claims and another version to generate CMS-1500 paper claims. Also, under HIPAA regulations, only medical offices that do not handle any other HIPAA-related transactions may still use paper claims. Because most insurance carriers accept electronic claims and the process for submitting electronic claims has become more streamlined and cost efficient, even smaller offices are submitting electronic claims, which, in general, are paid within a week or two instead of the usual 6–8 weeks for paper claim reimbursement.

Preparing Electronic Claims The information entered on electronic claims is called data elements. Many elements, like the patient’s personal and insurance information, are entered in the billing program before or at the time of the patient appointment, based on the patient registration form and on payer information and requirements. After the appointment is concluded, the claim is completed when the medical assistant keys the billing transactions—the services, charges, and payments—as detailed on the superbill (encounter form) into the billing claims software program. Once all the claims for the day are prepared, or often at a specified time each day, the software program is programmed to prepare claims for editing (“scrubbing”) and transmission.

Follow these tips when entering data in medical billing programs:

- Enter data in all capital letters.
- Do not use prefixes for people’s names, such as Mr., Ms., or Dr.
- Unless required by a particular insurance carrier, do not use special characters like hyphens, commas, or apostrophes.
- Use only valid data in all fields; avoid words such as “same.”

The X12 837 transaction requires a lot of information, and all of it must be correct. Most billing programs or claim transmission programs automatically reformat data such as dates into the correct formats. These data elements are reported in five major sections:

1. Provider
2. Subscriber (the insured or policyholder)
3. Patient (who may be the subscriber or another person)
4. Claim details
5. Services

Not all data elements are required. Some are considered situational and are required only when a certain condition applies. When it does apply, that data element also becomes required. For example, if a claim involves pregnancy, the date of the last menstrual period is required. If the claim does not involve pregnancy, that date should not be reported.

One of the provider elements required for electronic claims is the provider *taxonomy code*—a 10-digit number representing a provider’s medical specialty. Providers select the taxonomy code that most closely matches their education, license, or certification. The code is reported on claims because payment for some services is impacted by the specialty of the provider

performing them and by payers’ contracts. For example, nuclear medicine is usually a higher-paid specialty than internal medicine. An internist who also has a specialty in nuclear medicine would report the nuclear medicine taxonomy code when billing for that service and use the internal medicine taxonomy code when reporting internal medicine claims.

Before the HIPAA mandate for standard transactions, some payers required additional records, like their own information sheet, when providers billed them. Some payers also used their own coding systems. The HIPAA Electronic Health Care Transactions and Code Sets (TCS) mandate means that all health plans are required to accept the standard claim submitted electronically, although the information required by each payer may vary. Be sure to follow each payer’s specifications when submitting claims.

Other standard transactions also support the claim process—such as advising the office of claim status and payment—and apply to the treatment, payment, and operations (TPO) information exchanged between medical offices and health plans. Each electronic transaction has both a title and a number. Each number begins with X12—the number of the EDI format—followed by a unique number that stands for the transaction. Here are some examples of titles and numbers medical assistants may encounter while processing X12 837 healthcare claims:

Number	Title
X12 276/277	Claim status inquiry and response
X12 270/271	Eligibility inquiry and response
X12 278	Referral authorization inquiry and response
X12 835	Payment and remittance advice
X12 820	Health plan premium payments
X12 834	Enrollment in and withdrawal from a health plan

Paper Claim Completion

As stated previously, regardless of the office’s billing method, the patient’s demographic and billing information is usually updated at the patient’s office visit and entered into the office medical billing program. Then the program is instructed to print the data on a CMS-1500 paper form (also called the CMS-1505 because of the form’s 2005 update), shown in Figure 17-9. This claim may be mailed or faxed to the third-party payer.

Because of the HIPAA mandate regarding electronic claims submission, the paper claim is not as widely used as previously; however, the information it contains is very similar to the X12 837. The CMS-1500 contains 33 form locators, which are numbered blocks. Blocks 1–13 refer to the patient information and the patient and guarantor insurance coverage information. Blocks 14–33 contain information about the provider and the transaction information, including the patient’s diagnoses, procedures, and charges.

The following instructions provide step-by-step guidance in completing a CMS-1500 paper form, which you can practice with Procedure 17-3, Completing the CMS-1500 Claim Form, found at the end of this chapter. Figure 17-10 is an example of a completed Medicare claim that includes a secondary payer.

APPROVED OMB-0938-1197 FORM 1500 (02-12)

FIGURE 17-10 Completed CMS-1500 claim form for a Medicare patient with secondary insurance coverage.

HIPAA laws are equally important when working with patient financial information and when working with patient PHI in the medical record. Remember, keep access to patient medical and financial records confidential at all times, including the information contained within a paper or electronic health or claim file.

Completing the CMS-1500 Form In this section, let's complete the CMS-1500 claim form block by block.

Here is how to complete blocks 1–13, the patient and insured's information:

Block 1 Place an X in the appropriate insurance box.
(Note: Each box is to the left of the insurance plan it represents.)

1. MEDICARE ☐ (Medicare#)	MEDICAID ☐ (Medicaid#)	TRICARE ☐ (ID#/DoD#)	CHAMPVA ☐ (Member ID#)	GROUP HEALTH PLAN ☐ (ID#)	FECA BLK LUNG ☐ (ID#)	OTHER ☐ (ID#)
---	--	--	--	---	---	---

Block 1a Insert the insured's ID number exactly as it appears on the insurance card.
For W/C claims enter the patient's employee ID.
For property or casualty claims, enter the federal tax ID or SSN of the insured person or entity.

1a. INSURED'S I.D. NUMBER	(For Program in Item 1)
---------------------------	-------------------------

Block 2 Enter the patient's name in this order: last, first, middle initial (if used). Commas may be used to separate name components and a hyphen may be used between hyphenated last names. Do not use periods within the patient's name. If the patient is the insured, it is not necessary to complete the block, but check specific payer instructions before leaving it blank. Medicare requires this block to be completed.

2. PATIENT'S NAME (Last Name, First Name, Middle Initial)

Block 3 Enter the patient's birth date in the 8-digit format: XX/XX/XXXX. Place an X in the box representing the patient's sex.

3. PATIENT'S BIRTH DATE	SEX
MM DD YY	M ☐ F ☐

Block 4 Enter the insured's name in this order: last, first, middle initial (if used). For Medicare, leave blank; if TRICARE, enter the sponsor's name.
Commas may be used to separate name components and a hyphen may be used between hyphenated last names. Do not use periods within the patient's name.

4. INSURED'S NAME (Last Name, First Name, Middle Initial)

Block 5 Enter the patient's street address, city, state, and zip code. Do not use punctuation or symbols in the address fields. If the 9-digit zip code is used, include the hyphen. If the patient is the insured,

these fields may be left blank, but check individual payer guidelines before leaving them blank. Medicare requires these fields to be completed.
(Note: "Patient's Telephone" does not exist in 5010A1 [electronic claim]. The NUCC recommends that the phone not be reported.)

5. PATIENT'S ADDRESS (No., Street)	
CITY	STATE
ZIP CODE	TELEPHONE (Include Area Code) ()

Block 6 Enter an X for the patient's relationship to the insured. If the patient is insured, use Self; if Medicare, leave blank; if TRICARE, enter the patient's relationship to the sponsor. If the patient is a dependent, but has a unique member ID number that is reported on the claim, report Self, since the patient, although a dependent, is uniquely identified by this ID number.

6. PATIENT RELATIONSHIP TO INSURED				
Self ☐	Spouse ☐	Child ☐	Other ☐	

Block 7 Enter the insured's street address, city, state, and zip code if the insured's name is inserted in block 4. Do not use punctuation or symbols in the address fields. If the 9-digit zip code is used, include the hyphen. For Medicare claims, leave these fields blank. For W/C claims, enter the employer's address. For property and casualty claims, enter the address for the person entered as the insured.
(Note: "Insured's Telephone" does not exist in 5010A1 [electronic claim]. The NUCC recommends that the phone not be reported.)

7. INSURED'S ADDRESS (No., Street)	
CITY	STATE
ZIP CODE	TELEPHONE (Include Area Code) ()

Block 8 Reserved for NUCC Use (This field was previously used to report "Patient Status," which does not exist in 5010A1, so the field has been eliminated.)

8. RESERVED FOR NUCC USE

Block 9a–d (Note: Block 9 is used for the **secondary** insurance information and block 11 is used for the **primary** insurance information. You may find it easier to complete blocks 11 and 10 first, and then come back to block 9.)
9 If the patient has a *secondary* policy, enter the name (last, first, middle initial) of the insured

for this *secondary* policy. Commas may be used to separate name components and a hyphen may be used between hyphenated last names. Do not use periods within the patient's name.

- 9a Enter the *secondary* policy's group number or individual policy ID number. For a Medigap plan, enter the word "Medigap" before the ID number. No hyphens or spaces are allowed in group numbers.
- 9b This field was previously used to report "Other Insured's Date of Birth, Sex." This field has been eliminated because this information does not exist in 5010A1.
- 9c This field was previously used to report "Employer's Name or School Name." This information does not exist in 5010A1, so this field has been eliminated.
- 9d Enter the name of this *secondary* insurance plan. If this is a Medigap plan, enter the 9-digit CMS-assigned PAYERID.

9. OTHER INSURED'S NAME (Last Name, First Name, Middle Initial)
a. OTHER INSURED'S POLICY OR GROUP NUMBER
b. RESERVED FOR NUCC USE
c. RESERVED FOR NUCC USE
d. INSURANCE PLAN NAME OR PROGRAM NAME

Block 10a–c Place an X in the correct Yes or No box in each area to indicate whether the patient's condition is related to employment, auto accident, or other accident. If auto accident is answered Yes, insert the two-letter abbreviation for the state in which the accident occurred.

(Note: If any of these questions are answered yes, a workers' compensation, automobile, or other liability insurer may be responsible for the charges.)

10. IS PATIENT'S CONDITION RELATED TO:	
a. EMPLOYMENT? (Current or Previous)	
☐ YES	☐ NO
b. AUTO ACCIDENT?	
☐ YES	☐ NO PLACE (State)
c. OTHER ACCIDENT?	
☐ YES	☐ NO

Block 10d Claim Codes (Designated by NUCC)

When required by individual payers, condition codes approved by the NUCC may be inserted in this field. The condition codes approved for use on the 1500 claim form are available at <http://www.nucc.org>, under Code Sets.

10d. CLAIM CODES (Designated by NUCC)

Block 11a–d (Note: Block 11 is used for the primary insurance information. Many administrative assistants and billers find it easiest to complete block 11 before completing blocks 9 and 10.)

- 11 Enter the policy or group number for the primary insurance plan. If Medicare is the primary payer, enter the word NONE here and leave 11a–d blank. (The word NONE tells Medicare it is the primary payer. If the word NONE is not placed here, Medicare assumes it is the secondary payer.) Do not use hyphens or spaces within a policy or group number.
- 11a For primary payers other than Medicare, enter the insured's date of birth (XX/XX/XXXX) and sex. If gender is unknown, leave blank.
- 11b Enter the "Other Claim ID" designated by the NUCC, if applicable. At this time, the only qualifier approved is "Y4," identifying any property or casualty claim number. The qualifier is entered to the left of the vertical dotted line and the claim number listed to the right of the vertical dotted line.
- 11c Enter the insurance plan name for the primary insurance.
- 11d Place an X in the appropriate box indicating whether there is a secondary payer. If Yes is chosen, blocks 9a–d will be completed; if No is chosen, blocks 9a–d will be left blank.

11. INSURED'S POLICY GROUP OR FECA NUMBER	
a. INSURED'S DATE OF BIRTH MM DD YY	SEX M ☐ F ☐
b. OTHER CLAIM ID (Designated by NUCC)	
c. INSURANCE PLAN NAME OR PROGRAM NAME	
d. IS THERE ANOTHER HEALTH BENEFIT PLAN? ☐ YES ☐ NO If yes, complete items 9, 9a, and 9d.	

Block 12 The patient or authorized representative signs here, giving the provider permission to release his or her medical information to the insurance carrier.

Block 13 The patient or authorized representative signs here, authorizing the insurance carrier to send payment directly to the provider.

READ BACK OF FORM BEFORE COMPLETING & SIGNING THIS FORM. 12. PATIENT'S OR AUTHORIZED PERSON'S SIGNATURE I authorize the release of any medical or other information necessary to process this claim. I also request payment of government benefits either to myself or to the party who accepts assignment below. SIGNED _____ DATE _____	13. INSURED'S OR AUTHORIZED PERSON'S SIGNATURE I authorize payment of medical benefits to the undersigned physician or supplier for services described below. SIGNED _____
---	---

Now let's move on to blocks 14–33, the provider's information. In blocks 14–18, dates may be listed in either the 6-digit (MMDDYY) or 8-digit format, but once chosen, the format must be consistent within the claim.

Block 14 Enter the date of the current illness, injury, or pregnancy (last menstrual period [LMP]) using the 8-digit format. The qualifier entered to the right of the dotted vertical line identifies the date as LMP or other symptom:

431 Onset of Current Symptoms or Illness
484 Last Menstrual Period

14. DATE OF CURRENT ILLNESS, INJURY, or PREGNANCY (LMP)				
MM	DD	YY	QUAL.	

Block 15 Enter an “Other Date” related to the patient’s condition or treatment. Previous pregnancies are not considered a similar illness. Leave blank if unknown. The identifying qualifier is listed first between the vertical dotted lines. Acceptable qualifiers include

454 Initial Treatment
304 Latest Visit or Consultation
453 Acute Manifestation or a Chronic Condition
439 Accident
455 Last X-ray
471 Prescription
090 Report Start
091 Report End
444 First Visit or Consultation

15. OTHER DATE				
QUAL.		MM	DD	YY

Block 16 Enter the dates the patient is or was unable to work, using the chosen date format. (This information could signal a workers’ compensation case if work-related.)

16. DATES PATIENT UNABLE TO WORK IN CURRENT OCCUPATION									
FROM		MM	DD	YY	TO		MM	DD	YY

Block 17 Enter the name of the referring, ordering, or supervising physician (first, middle, and last) with credential. To the left of the vertical dotted line, enter the qualifier to identify the provider:

DN—Referring Provider
DK—Ordering Provider
DQ—Supervising Provider

(Note: Medicare will reject claims containing the provider’s middle name or initial and/ or the credential. It requires neither.)

Block 17a–b Some insurers require provider identifiers other than the NPI.

- 17a If required, enter the approved 2-digit qualifier from Table 17-1 with the provider identifier next to it; otherwise, leave blank. Medicare requires this field to be blank. Only the provider NPI is submitted to Medicare.
- 17b Enter the referring provider NPI number.

17. NAME OF REFERRING PROVIDER OR OTHER SOURCE		17a.	
		17b.	NPI

Block 18 If applicable, enter the dates the patient was hospitalized during this claim, using the chosen date format for consistency.

18. HOSPITALIZATION DATES RELATED TO CURRENT SERVICES									
FROM		MM	DD	YY	TO		MM	DD	YY

Block 19 Additional Claim Information (Designated by NUCC). To use this field, refer to the most current instructions from the public or private payer regarding use of this field and the qualifiers required. Otherwise, leave this field blank. Medicare uses this field for information related to chiropractic manipulations. See the Medicare Claims Processing Manual, Chapter 26, Section 10.4, for specific instructions for chiropractic claims. W/C programs also have very specific guidelines. Check with the individual W/C program involved for their instructions.

19. ADDITIONAL CLAIM INFORMATION (Designated by NUCC)

Block 20 If the office is billing for services provided by an outside laboratory, place an X in the Yes box and enter the amount being billed for the lab. Enter the laboratory name, address, and NPI in block 32. If only labs performed in your office are being billed, enter an X in the No box.

20. OUTSIDE LAB?		\$ CHARGES	
☐ YES	☐ NO		

Block 21 Enter the multi-character ICD-10 codes indicating the patient diagnoses. (You will learn more about diagnosis coding in the *Diagnostic Coding* chapter.) Enter the codes in spaces A–L in descending order of importance. Do NOT use decimal points when inserting the diagnosis codes. The ICD indicator will be inserted in the upper right corner between the two vertical dotted lines, indicating which type of ICD codes is being used.

- 9—ICD-9 codes (replaced 10/1/15 with ICD-10 codes)
- 0—ICD-10 codes

21. DIAGNOSIS OR NATURE OF ILLNESS OR INJURY Relate A–L to service line below (24E)				ICD Ind.	
A.	B.	C.	D.		
E.	F.	G.	H.		
I.	J.	K.	L.		

Block 22 If required by the payer, enter the original reference number for claims being resubmitted. The resubmission code identifies the type of claim being submitted:

- 7 Replacement of prior claim
- 8 Void/cancel of prior claim

22. RESUBMISSION CODE	ORIGINAL REF. NO.
-----------------------	-------------------

Block 23 If required, enter the prior authorization number received by the payer for the procedure performed (if prior authorization is required and not received, or if authorization is received but the number is not present on the claim, the claim will be denied). Hyphens and spaces are not allowed within an authorization number.

23. PRIOR AUTHORIZATION NUMBER

Blocks 24 A–J The six service lines here are used to enter the services provided to the patient. They are divided horizontally between shaded and nonshaded areas to accommodate supplemental information that may be required by the payer regarding the service provided. Check with individual payers regarding the use of these shaded areas. For 24I and 24J, the NPI is inserted in the nonshaded areas and the non-NPI information with its appropriate qualifier is inserted in the shaded areas. Follow individual payer requirements for use of these shaded areas. Remember that Medicare requires only that the NPI be submitted.

- 24A Enter the dates of service using the 6-digit format. If the service is provided on one date, enter the same date twice.
- 24B Enter the 2-digit place of service code from Table 17-5. Keep a listing nearby for handy reference.
- 24C EMG stands for emergency service indicator. If the insurer requires this information, and the service was provided on an emergency basis, enter Y for yes. If service was not provided on an

TABLE 17-5 Place of Service Codes for CMS-1500 Form

Code	Place of Service
11	Office
12	Home
21	Inpatient Hospital
22	Outpatient Hospital
23	Emergency Department—Hospital
24	Ambulatory Surgical Center
25	Birthing Center
26	Military Treatment Facility
31	Skilled Nursing Facility
32	Nursing Facility
33	Custodial Care Facility
34	Hospice

emergency basis or if the insurer does not require the information, leave blank. For Medicare, leave blank.

- 24D Enter the appropriate CPT or HCPCS code with modifier, one per line, to represent each service provided. (You will learn more about CPT and HCPCS coding in the *Procedural Coding* chapter.)
- 24E Enter the reference number A–L from block 21 to represent the diagnosis code associated with each procedure or service performed. This identifies the medical necessity for the service provided.
- 24F Enter the fee charged for each service provided.
- 24G Enter the days or units for each service provided. For instance, if the patient had three 15-minute (15 minutes = 1 unit) physical therapy treatments, enter 3. Even if the unit is one, enter the number 1.
- 24H EPSDT stands for Early, Periodic, Screening, Diagnosis, and Treatment. It is for Medicaid programs. If the procedure is related to EPSDT for a Medicaid patient, enter Y; otherwise, leave blank. If the program requires a reason code instead of a Y/N response, the following codes will be substituted for the Y/N response:
 AV Available—Not Used (Patient refused referral.)
 S2 Under Treatment (Patient currently under treatment for referred diagnostic or corrective health problem.)
 ST New Service Requested (Referral to another provider for diagnostic or corrective treatment/scheduled for another appointment with screening provider for diagnostic or corrective treatment for at least one health problem identified during an initial or periodic screening service, not including dental referrals.)
 NU Not Used (Used when no EPSDT patient referral was given.)
- 24I If the payer requires a non-NPI identifier, enter its qualifier (see Table 17-1) in the shaded area. If it is not required, leave blank. For Medicare, leave the shaded area blank.
- 24J If a non-NPI qualifier was entered in the shaded area, enter the appropriate non-NPI identifier in the shaded area. If it is not required, leave the shaded area blank. Enter the provider's NPI number in the nonshaded area. For Medicare, leave the shaded area blank.

24. A. DATE(S) OF SERVICE						B. PLACE OF SERVICE	C. EMG	D. PROCEDURES, SERVICES, OR SUPPLIES (Explain Unusual Circumstances) CPT/HCPCS MODIFIER				E. DIAGNOSIS POINTER	F. \$ CHARGES	G. DAYS OR UNITS	H. EPSDT Family Plan	I. ID. QUAL.	J. RENDERING PROVIDER ID. #

3																NPI	
4																NPI	
5																NPI	
6																NPI	

Block 25 Enter the provider's Tax ID number. Place an X in the box identifying it as SSN (Social Security number) or EIN (employer identification number).

25. FEDERAL TAX I.D. NUMBER	SSN EIN
	☐ ☐

Block 26 Enter the patient's account number (if used by your office). No hyphens or spaces are accepted in account numbers.

26. PATIENT'S ACCOUNT NO.

Block 27 Place an X in the Yes box to indicate the provider is accepting assignment on the claim (the check will be issued directly to the provider). Place an X in the No box to indicate the provider is not accepting assignment on the claim (the check will be issued to the patient).

27. ACCEPT ASSIGNMENT? (For govt. claims, see back)
☐ YES ☐ NO

Block 28 Enter the total charges for the claim by totaling charges from column 24F in lines 1–6.

Block 29 Enter any amount paid by a primary payer or patient on covered services. If this is a primary claim, leave blank. For Medicare claims, leave blank.

Block 30 Reserved for NUCC use. This block was used to enter the "Balance Due," which does not exist in 5010A1, so the field has been eliminated here.

28. TOTAL CHARGE	29. AMOUNT PAID	30. Rsvd for NUCC Use
\$	\$	

Block 31 The physician or provider should sign and date the form here. Be sure the provider's credential is included in the signature.

31. SIGNATURE OF PHYSICIAN OR SUPPLIER INCLUDING DEGREES OR CREDENTIALS (I certify that the statements on the reverse apply to this bill and are made a part thereof.)	
SIGNED	DATE

Block 32 Enter the name and address of the facility providing the services if different from the billing provider. Post office boxes are not accepted for the facility or billing provider address and the zip code must consist of the full 9 digits given by the US Postal Service. No punctuation is used within the address, but a hyphen is included within the 9-digit zip code. If the billing provider and service facility provider are the same or if the service took place in the patient's home, leave block 32 blank.

32a Enter the servicing provider's NPI.

32b If required by the insurer, enter the servicing provider's appropriate 2-digit qualifier followed by the non-NPI identifier required. For Medicare, leave this field blank.

32. SERVICE FACILITY LOCATION INFORMATION	
a. NPI	b.

Block 33 Enter the billing provider's name, address, city, state, 9-digit zip code, and phone number. No punctuation is used within the address, but a hyphen is included within the 9-digit zip code. No PO Boxes may be used in this field.

33a Enter the billing provider's NPI.

33b If required by the insurer, enter the billing provider's appropriate 2-digit qualifier, followed by the non-NPI identifier required. For Medicare, leave this field blank.

33. BILLING PROVIDER INFO & PH # ()	
a. NPI	b.

Although the basic information required to complete the CMS-1500 claim is the same for every provider and insurance plan, you will find that instructions for completing the claim form vary among insurance carriers. So follow the individual carrier's instructions carefully to obtain a clean claim with every submission. Procedure 17-3 provides an outline for completing the CMS-1500 claim.

▶ Transmitting Electronic Claims LO 17.7

Although hospitals and large practices have been using the X12 837 healthcare claims for quite some time now, smaller offices are still using paper claims for many of their claims submissions. Although even larger practices that have been using electronic claims processing consistently may be hesitant about choosing an electronic health records (EHR) software program, they will find health claims filing to be more efficient with EHR, as many of these programs can streamline the overall claims process. For example, with an EHR program, there is no need to repeatedly handwrite, key, or produce a computer-generated claim. The electronic claim template contains the instructions on placement of the information within the electronic claim. This information is pulled from the patient record automatically with a few of the medical assistant's simple keystrokes, which queue the claim for processing. At the time of transmission, all queued "clean" claims are transmitted with a few basic computer commands.

Practices handle electronic claims transmission—also called electronic media claims, or EMC—in a variety of ways. Some practices transmit claims themselves; others hire outside vendors to handle this task for them.

Three major methods are used to transmit claims electronically: direct transmission to the payer, clearinghouse use, and direct data entry.

Transmitting Claims Directly

In the direct transmission approach, medical offices and payers exchange transactions directly, using the necessary information systems—including a translator and communications technology—to conduct electronic data interchange (EDI).

Using a Clearinghouse

Many offices whose medical billing software vendors do not have translation software must use a **clearinghouse** in order to send and receive data in the correct EDI format. Clearinghouses can translate nonstandard formats into standard formats and many also "scrub" the claims "clean" prior to submission to ensure each claim meets coding and payer claim standards so the claim will be paid rapidly. Clearinghouses also apply software checks to claims they receive and transmit back reports of errors or missing information to the provider so claims can be corrected before they even reach the payer. To ensure that the standard format is compliant, the clearinghouse must receive all the required data elements from the physician, as clearinghouses are prohibited from creating or modifying data content.

Medical offices may use a clearinghouse to transmit all their claims, or they may use a combination of direct transmission and a clearinghouse. For example, they may send claims directly to Medicare, Medicaid, and a few other major commercial payers and use a clearinghouse to send claims to other, smaller payers.

Using Direct Data Entry

Some payers offer online direct data entry (DDE), which uses an Internet-based service into which employees can key the

standard data elements. Although the data elements must meet the HIPAA standards requirements regarding content, EDI formatting is not required. Instead, the elements are loaded directly in the health plans' computer. One drawback is that each claim must be hand-keyed into the system each time the patient is seen, unlike the office billing software, which keeps the patient's prior information within its database.

Generating Clean Claims

Although healthcare claims, whether submitted electronically or by paper, require many data elements and are complex, it is often simple errors that prevent you from generating "clean" claims—those accepted for processing by the payer. Claims should be carefully checked for common errors (Table 17-6) before transmission or printing. Prior to submitting any insurance claim, make sure you have access to the insurance carrier's most recent claim submission manual. Following the instructions in that manual carefully will result in clean claims the majority of times.

If you receive a paper query from an insurance carrier or electronic notification of claim rejection for any reason (including those shown in Table 17-6), provide the missing or corrected information or, if required, submit a new claim with corrected information. For instance, if any facility information is missing, insert the missing information and submit a corrected claim. If a provider number is missing, obtain the correct provider number from the referring or treating physician's office and submit a corrected claim with the appropriate ID number. Do note that most errors are errors of omission and if claims are checked carefully prior to submission, most errors can be caught, resulting in clean claims the first time around.

Claims Security

Most medical offices use computer networks in which personal computers are connected to a local area network (LAN), so users can exchange and share information and hardware. The LAN is linked to remote networks like the Internet by a router that determines the best route for data (which include electronic patient data) to travel across the network. Packets of data traveling between the LAN and the Internet—like electronic claims—must usually pass through a firewall, a security

TABLE 17-6 Common Errors Preventing Clean Claims

- Missing or incomplete service or billing provider name, address, and identification for the services rendered, including invalid zip codes or state abbreviations
- Missing Medicare assignment indicator or benefits assignment indicator
- Missing part of the name or the identifier of the referring provider
- Missing or invalid subscriber or patient information, including misspelling of names
- Missing or invalid information regarding secondary insurance plans
- Missing payer name and/or payer identifier, required for both primary and secondary payers

The HIPAA rules set standards for protecting individually identifiable protected health information (PHI) when it is maintained or transmitted electronically. Medical offices use a number of security measures to protect the confidentiality, integrity, and availability of this information, including

- Refer to the *Legal and Ethical Issues* chapter for further information regarding all HIPAA and confidentiality standards, including those for electronic transmissions.

LO 17.8

If claims are transmitted electronically, the billing program or the clearinghouse will create a log of transmitted claims to allow you to track the progress of the submitted charges. If your office submits paper claims, you should create and maintain a claims register like the one shown in Figure 17-11. Procedure 17-4, at the end of the chapter, outlines the steps for creating a claims register.

Review for Medical Necessity

The insurance carrier reviews each claim to determine whether the procedures provided and the accompanying diagnoses are compatible and whether the treatment is medically necessary, as explained further in the *Diagnostic Coding* and *Procedural Coding* chapters.

The claims department also compares the fees the provider has charged with the benefits provided by the patient's health insurance policy. This review determines the amount of deductible and/or coinsurance the patient owes. The amount the patient owes the practice is known as patient liability.

After reviewing and accepting the claim, the insurer pays a benefit, either to the practice or to the subscriber (patient), depending on whether an assignment of benefits was signed and on the policy of the insurance carrier. With the payment, the insurer sends a **remittance advice (RA)** or an **explanation of payment (EOP)**, sometimes called an **explanation of benefits (EOB)**. If the payment is made electronically, the RA will also be received electronically. In this case, the RA is known as an electronic remittance advice (ERA) or electronic explanation of benefits (EEOB). A patient who receives the payment receives an RA summary containing only his information and the practice receives a practice RA that typically contains information for multiple patients at one time. Each insurance plan has its own EOP (RA) format and you will learn those of your office's most popular payers. Because many patients may be included on each EOP (RA), you may find it easiest to use a ruler to read each line of a paper RA and check off each line as you credit each patient's account. If a secondary insurance carrier requires a copy of a patient's primary insurance EOP, remember to black out any information on the EOP that does not pertain to the patient information required by the insurance carrier, to protect the information of the other patients on the EOB. The RA or the EOP explains the medical claim. For each service submitted to an insurer, the RA or EOP form gives the following information:

- Name of the insured and identification number
- Patient name
- Claim number
- Date of service, place of service, and procedure code for service provided
- Amount billed by the practice

[illegible]

374 CHAPTER 17

- Amount allowed
- Amount of patient liability (coinsurance, copayment, deductible, or noncovered services)
- Amount paid
- A notation of any services not covered and an explanation of why they were not covered (for example, many insurance plans do not cover routine vision screenings and only a certain dollar amount of well-baby visits for infants)

Reviewing the Insurer's RA and Payment

Verify all information on the RA, line by line, using your records for each patient represented on the RA. As stated earlier, in a large practice, you will frequently receive payments and RAs for multiple patients at one time. An example of a Medicare RA, or Medicare Remittance Advice, is shown in Figure 17-12.

If all numbers on the RA agree with your records, you can make the appropriate entries in the insurance tracking

log for claims paid. In a small practice, the insurance tracking log is used to track filed claims, using such information as patient name, date the claim was filed, services the claim reflects, notations about the claim results, and any balance due from the patient. Larger practices tend to track claims in the computer billing program in a file called, for example, "Unpaid Claims." If you do not hear from a payer about a claim or the payment does not appear to match your records, you will need to trace the claim or place a query with the insurance company.

When a claim is rejected or denied, the RA states the reason. You will need to review the claim, examining all procedural and diagnosis codes for accuracy, and compare it with the patient's insurance information. In order to receive payment for the claim, you will often need to contact the insurance company by telephone to find out how to resolve the claim problem and then submit a corrected claim to obtain payment.

PROCEDURE 17-1 Verifying Workers' Compensation Coverage

Procedure Goal: To verify workers' compensation coverage before accepting a patient

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Telephone, paper, and a pen

Method:

1. Call the patient's employer and verify that the accident or illness occurred on the employer's premises or at an employment-related work site.
2. Obtain the employer's approval to provide treatment. Be sure to write down the name and title of the person giving approval, as well as his phone number.
RATIONALE: *Without approval, treatment costs may not be covered.*
3. Ask the employer for the name of its workers' compensation insurance company. (Employers are required by law to carry such insurance. It is a good policy to notify your state labor department about any employer you encounter that does not have workers' compensation insurance, although you are not required to do so.)

If the employer has not done so, remind them to report the incident to the W/C carrier, using the

First Report of Injury or Illness, and to the state labor department within 24 hours of the incident.

RATIONALE: *Without this form on file, the claims will not be approved for payment.*

4. Contact the insurance company and verify that the employer does indeed have an active policy in good standing with the company.

RATIONALE: *The insurance company will not pay for services without a valid policy.*

5. Obtain the claim number assigned to the case from the insurance company. This claim number is placed on all claims and submitted paperwork.

RATIONALE: *All invoices must include the claim number in order for the practice to receive payment.*

6. When the patient begins treatment, create a patient record. If the patient is already an active patient with the practice, create separate medical and financial records for the workers' compensation-related treatment.

RATIONALE: *This is the legal procedure to protect patient confidentiality with regard to private medical care. Confidentiality does not exist with regard to care related to workers' compensation cases because the employer and its insurer are paying for the patient's medical care.*

PROCEDURE 17-2 Submitting a Request for Prior Authorization

WORK // DOC

Procedure Goal: To submit a request for prior authorization

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Prior authorization form, patient medical chart with planned procedure and CPT code, diagnosis and ICD code for proof of medical necessity, and patient financial record or the following information: patient name, address, DOB, subscriber name and relationship to patient if not the same, insurance policy group, and ID numbers

Method:

1. Place a call to the insurance carrier or access the website if available.
2. When you reach the nurse manager for the patient's policy, explain that you would like to obtain prior authorization for the requested procedure. She will ask a series of questions regarding the patient, procedure, and diagnosis. Answer these questions using the assembled materials from the patient's medical and financial records.
RATIONALE: *The more information available regarding the proposed procedure and the reason for it, the easier it is to obtain prior authorization.*

3. If obtaining authorization via the insurance carrier's website, access the website utilizing your user ID and password. Enter the prior authorization area of the website and enter the required information using the assembled materials from the patient's medical and financial records.

RATIONALE: *The more information available regarding the proposed procedure and the reason for it, the easier it is to obtain prior authorization.*

4. When prior authorization is obtained, carefully record the authorization number and the name and extension number of the person issuing the authorization (if obtained over the phone). If the authorization is obtained via a website, print out the authorization documentation.

RATIONALE: *If authorization is received, but the authorization number is not on the claim form or is incorrect, payment may still be denied.*

5. Place the authorization number and/or documentation in the patient medical and financial record for further reference, as it will be required when submitting the patient's health insurance claim.

PROCEDURE 17-3 Completing the CMS-1500 Claim Form

WORK // DOC

Procedure Goal: To complete the CMS-1500 claim form correctly

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Patient record, CMS-1500 form, NUCC Non-NPI Qualifiers and Place of Service Codes, typewriter, computer or pen, and patient ledger card or charge slip

Method:

Note: The numbers below correspond to the numbered fields on the CMS-1500.

1. Place an X in the appropriate insurance box.
 - a. Insert the insured's ID number exactly as it appears on the insurance card.
2. Enter the patient's name, as it appears on the insurance card, in this order: last, first, middle initial (if used).
3.
 - a. Enter the patient's birth date in the 8-digit format.
 - b. Place an X in the box representing the patient's sex: male or female.
4. Enter the insured's name, as it appears on the insurance card, in this order: last, first, middle initial (if used).
5. Enter the patient's street address, city, state, and zip code.
6. Enter an X for the patient's relationship to the insured. If the patient is the insured, use Self.

7. Enter the insured's street address, city, state, and zip code. For Medicare claims, leave these fields blank.

RATIONALE: *Medicare patients are always both the insured and the patient.*

8. Reserved for NUCC Use. Leave blank unless instructed otherwise by the insurer.
9. Enter the last name, first name, and middle initial of the insured (as shown on the insurance card) for this secondary policy covering the patient.

RATIONALE: *This is the block for the secondary insurance. The primary insurer will want to know who carries the secondary insurance.*

- a. Enter the secondary policy's group number or individual policy ID number.
- b. This field is now left blank.
- c. This field is now left blank.
- d. Enter the name of this secondary insurance plan. If this is a Medigap plan, enter the 9-digit CMS-assigned PAYERID.
RATIONALE: *The PAYERID tells Medicare the coverage is a Medigap plan.*

10. Place Xs in the appropriate Yes or No box in a, b, and c to indicate whether the patient's place of employment, an auto accident, or another accident caused the patient's condition. If an auto accident is responsible, for the

PLACE, enter the two-letter state postal abbreviation for the location of the accident.

RATIONALE: *If any of these boxes is marked “Yes,” another insurance plan is probably liable for the charges (workers’ compensation, auto insurance, or other liability plan).*

- d. If a claim code is required by an individual payer, insert in this field.
- 11. Enter the policy or group number for the primary insurance plan. If Medicare is the primary payer, enter the word NONE here and leave 11a–d blank.
 - a. Enter the insured’s date of birth (XX/XX/XXXX) and sex. If gender is unknown, leave blank.
 - b. Enter the “Other Claim ID” designated by the NUCC, if applicable.
 - c. Enter the insurance plan name for the primary insurance.
 - d. Place an X in the appropriate box indicating if there is a secondary payer or not.

RATIONALE: *If the answer is “No,” there is no other insurance coverage, and fields for block 9 will remain blank.*

- 12. The patient or authorized representative signs and dates the form here. If signatures are on file, this may be noted by inserting “Signature on File.”

RATIONALE: *Without a signature authorizing release of information, you do not legally have permission to submit this information to the insurance carrier.*

- 13. The patient or authorized representative signs here. If signatures are on file, this may be noted by inserting “Signature on File.”

RATIONALE: *Without this signature, the insurance carrier may send payment for the provider’s services to the patient.*

Provider Information Section

- 14. Enter the date of the current illness, injury, or pregnancy (LMP) using the 8-digit format. Enter the qualifier to the right of the dotted vertical line to identify the date as LMP or other symptom.
- 15. If an “Other Date” related to the patient’s condition or treatment is known, enter here. Leave blank for Medicare or if unknown. If completed, enter the identifying qualifier between the vertical dotted lines found just prior to this date.

RATIONALE: *Information is used to analyze “pre-existing conditions”; Medicare does not require this information.*
- 16. Enter the dates the patient is or was unable to work, using the chosen date format. This information could signal a workers’ compensation claim.
- 17. Enter the name of the referring, ordering, or supervising physician (first, middle, and last) with credential. For Medicare, omit the middle name and credential. To the left of the vertical dotted line, enter the qualifier to identify the provider.

RATIONALE: *Medicare may reject the claim if a middle initial and/or credential is submitted.*

- a. If required by the payer, enter the approved 2-digit qualifier from Table 17-1 with the provider identifier next to it; otherwise, leave blank. Medicare requires this field to be blank. Only the provider NPI is submitted to Medicare.

- b. Enter the referring provider NPI number.

RATIONALE: *All payers require the provider NPI.*

- 18. If applicable, enter the dates the patient was hospitalized during this claim.
- 19. Refer to the most current instructions from the public or private payer regarding use of this field and the qualifiers required. Otherwise, leave this field blank. Medicare uses this field for information related to chiropractic manipulations.
- 20. Place an X in the Yes box if a laboratory test was performed outside the provider’s office and enter the amount being billed for the lab for these procedures. Enter the laboratory name, address, and NPI in block 32. Place an X in the No box if the test was done in the provider’s office that is billing the insurance carrier.
- 21. Enter the ICD codes indicating the patient diagnoses in spaces A–L in descending order of importance.
 - a. Enter the ICD indicator in the upper right corner between the two vertical dotted lines indicating which type of ICD code is being used.
- 22. If required by the payer, enter the original reference number for claims being resubmitted. The resubmission code identifies the type of claim being submitted.
- 23. Enter the prior authorization number if required by the payer. For Medicare, leave blank.

RATIONALE: *Payers who require prior authorizations will deny claims without them. Medicare does not require prior authorization and will reject claims with “unauthorized” information in this area.*

- 24. The six service lines here are used to enter the services provided to the patient. They are divided horizontally between shaded and nonshaded areas to accommodate supplemental information that may be required by the payer regarding the service provided.
 - a. Enter the dates of service using the 6-digit format.
 - b. Enter the 2-digit place of service code from Table 17-5.
 - c. EMG stands for emergency service indicator. If the insurer requires this information, and the service was provided on an emergency basis, enter a Y for yes. If service was not provided on an emergency basis or if the insurer does not require the information, leave blank.
 - d. Enter the appropriate CPT or HCPCS code with modifier, one per line, to represent each service provided.

RATIONALE: *These codes tell the payer which service was provided to or for the patient.*

- e. Enter the reference number A–L from block 21 to represent the diagnosis code associated with each procedure or service performed.
RATIONALE: Each “pointer” identifies the medical necessity for each service provided.
- f. Enter the fee charged for each service provided.
- g. Enter the days or units for each service provided.
- h. If the procedure is related to EPSDT for a Medicaid patient, enter Y; otherwise, leave blank.
- i. If the payer requires a non-NPI identifier, enter its qualifier in the shaded area.
- j. If a non-NPI qualifier was entered in the shaded area, enter the appropriate non-NPI identifier in the shaded area. If it is not required, leave the shaded area blank. Enter the provider’s NPI number in the nonshaded area. For Medicare, leave shaded area blank.
RATIONALE: The NPI identifies the practitioner providing the service.
- 25. Enter the provider’s Tax ID number. Place an X in the box identifying it as SSN (Social Security Number) or EIN (Employer Identification Number).
RATIONALE: This information is required for tax purposes.
- 26. Enter the patient’s account number (if used by your office).
- 27. Place an X in the Yes box or the No box to indicate whether the provider is accepting assignment on the claim.
RATIONALE: This block tells the payer if you are a participating provider.

- 28. Enter the total charges for the claim.
- 29. Enter any amount paid by a primary payer or patient on covered services. If this is a primary claim, leave blank. For Medicare claims, leave blank.
RATIONALE: Medicare does not require this information.
- 30. Block 30 is to be left blank.
- 31. The physician or provider should sign and date the form here.
RATIONALE: The provider’s signature confirms that he or she provided the services listed.
- 32. Enter the name and address of the facility providing the services if different from the billing provider. If the billing provider and service facility provider are the same or if the service took place in the patient’s home, leave block 32 blank.
 - a. If block 32 is completed, enter the servicing provider’s NPI.
 - b. If block 32 is completed and if required by the insurer, enter the servicing provider’s appropriate 2-digit qualifier followed by the non-NPI identifier required.
- 33. Enter the billing provider’s name, address, city, state, 9-digit zip code, and phone number.
 - a. Enter the billing provider’s NPI.
 - b. If required by the insurer, enter the billing provider’s appropriate 2-digit qualifier, followed by the non-NPI identifier required.

PROCEDURE 17-4 Tracking Insurance Claims Submissions **WORK // DOC**

Procedure Goal: To create and use a spreadsheet to track insurance claims submissions

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: CMS-1500 claims prepared for submission or record of CMS-1500 claims submitted electronically; Insurance Claims Register or computer with software program such as MS Excel, allowing for the creation of a spreadsheet.

Method

1. Use the Insurance Claims Register or create a spreadsheet with the following headings: Patient Name (and/or account number); Insurance Company; Date of Submission and Amount of the Claim; Insurance Response and Date of Response; Date of Resubmission; Date of Payment; Payment Amount; Patient Balance; and Date of Patient Billing.

2. Using the list of claims submitted, complete the blanks for patient name, insurance company, date of submission, and amount of the claim.
3. When the RA (EOB) is received, complete the date and response columns, including whether the claim is paid, rejected, or denied or a request was made for more information.
RATIONALE: This allows you to follow up in the future once correction or requested information is submitted to the insurance carrier.
4. If resubmission is required, enter the date of resubmission.
5. If payment is received, enter the date of receipt and the amount of the payment.
RATIONALE: This information tells you the insurance carrier has met its obligation.
6. Record patient balance (if any) and the date the patient is billed.
RATIONALE: You now can track the remaining balance owed by the patient.

S U M M A R Y O F L E A R N I N G O U T C O M E S

LEARNING OUTCOMES	KEY POINTS
17.1 Define the basic insurance terms used by the insurance industry.	The following are terms used by insurance companies, knowledgeable medical assistants, medical billers, and coders: <i>premium, benefit, lifetime maximum, deductible, coinsurance, copayment, exclusions, formulary, elective procedure, precertification, and preauthorization.</i>
17.2 Compare fee-for-service plans, HMOs, and PPOs and explain the new concept of patient centered medical home.	Fee-for-service plans are traditional plans where, after a yearly deductible is met, the insurance plan pays for a percentage of the charges and the patient is responsible for the other percentage (often 80% insurance plan and 20% patient). HMOs are prepaid plans that pay the providers either by capitation or by contracted fee-for-service with patients choosing a PCP, seeing preferred providers, and paying a fixed per-visit copay. A PPO is a managed care plan that establishes a network of providers to perform services for plan members. Members may seek out-of-network care, but their costs will be higher. The patient centered medical home model is a new approach to preventive care that puts the patient and family at the center of the decision-making process using a coordinated team approach to patient care.
17.3 Outline the key requirements for coverage by the Medicare, Medicaid, TRICARE, and CHAMPVA programs.	Medicare provides health insurance for citizens aged 65 and older as well as for certain disabled workers, disabled widows of workers, and patients with long-term disability related to chronic kidney disease on dialysis and end-stage renal disease requiring transplant. Medicaid is a health benefit plan for low-income, blind, or disabled patients; needy families; foster children; and children born with birth defects. TRICARE is a healthcare benefit for families of uniformed personnel and retirees from the uniformed services. CHAMPVA covers the expenses of the families of veterans with total, permanent, service-connected disabilities as well as expenses for surviving spouses and dependent children of veterans who died in the line of duty or as a result of service-connected disabilities.
17.4 Describe allowed charge, contracted fee, capitation, and the formula for RBRVS.	An allowed charge is the maximum dollar amount an insurance carrier will base its reimbursement on—it is also the maximum amount a participating provider is allowed to collect. A contracted fee is a negotiated fee between the MCO and the provider. Capitation is a fixed prepayment paid to the PCP in most plans. RBRVS stands for resource-based relative value scale. Its formula is $RVU \times GAF \times CF$.
17.5 Outline the tasks performed to obtain the information required to produce an insurance claim.	The claims process includes obtaining patient information, delivering services to the patient and determining the diagnosis and fee, recording charges and codes, documenting payment from the patient, and preparing the healthcare claims.
17.6 Produce a clean CMS-1500 health insurance claim form.	Using the step-by-step instructions within the chapter and Procedure 17-3, and given a completed encounter form (superbill) with all necessary information, the student should produce a legible, clean, and acceptable CMS-1500 claim form.
17.7 Explain the methods used to submit an insurance claim electronically.	The three methods used to submit claims electronically are a claims submission directly to the payer's website via an electronic data interchange, the use of a clearinghouse to "scrub" and submit claims to the payer for the provider, and the use of direct data entry, or DDE.

LEARNING OUTCOMES

- 17.8** Recall the information found on every payer's remittance advice.

KEY POINTS

Although the format may vary from payer to payer, all RAs (EOBs) contain the following information: name of the insured and identification number; patient name; claim number, date of service, place of service, and code for the service provided; amount billed; amount allowed; amount of subscriber liability; amount paid; and a notation of any services not covered and an explanation of why they were not covered.

CASE STUDY CRITICAL THINKING

© McGraw-Hill Education

Recall Sylvia Gonzales from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding her case.

1. Which insurance plan will be primary for Mrs. Gonzales if the state she lives in uses the birthday rule?
2. If Mr. Gonzales's insurance is primary, explain how the payment will be calculated by the insurance carrier for today's office visit and two lab tests.
3. If the HMO plan is considered primary, what will Sylvia's portion of the charges consist of?

EXAM PREPARATION QUESTIONS

1. (LO 17.1) A fixed-dollar amount the subscriber must pay, or "meet," each year before the insurer begins to cover expenses is the
 - a. Copayment
 - b. Deductible
 - c. Premium
 - d. Coinsurance
 - e. Lifetime maximum
2. (LO 17.1) Depending upon the type of plan, the patient's portion of the medical charges after the insurance has paid is known as the
 - a. Copayment
 - b. Deductible
 - c. Coinsurance
 - d. Premium
 - e. Copayment or coinsurance
3. (LO 17.2) Most specialists are paid by MCOs using which of the following methods?
 - a. Fee-for-service
 - b. Capitation
 - c. Copayment
 - d. Coinsurance
 - e. Negotiated per-service fees
4. (LO 17.3) The national health insurance plan for Americans age 65 and older is
 - a. Medicaid
 - b. Medicare
 - c. TRICARE
 - d. CHAMPVA
 - e. Workers' compensation
5. (LO 17.3) The appropriate definition for Medicaid plans is
 - a. Health insurance plan
 - b. Welfare
 - c. Health benefit plan
 - d. Liability plan
 - e. Health insurance benefit
6. (LO 17.4) RBRVS consists of which components?
 - a. RVU
 - b. GAF
 - c. CF
 - d. RVU, GAF, and CF
 - e. RVU and CF only

7. (LO 17.5) Which of the following is *not* performed by the medical practice when preparing a healthcare claim for payment and reviewing the insurance payment?
 - a. Submitting the employer's first report of illness or injury
 - b. Obtaining patient information
 - c. Delivering services to the patient and determining the diagnosis and fee
 - d. Recording charges and codes, recording payment from the patient, and preparing and submitting the healthcare claim
 - e. Reviewing the insurer's processing of the claim, remittance advice, and payment
8. (LO 17.6) Why is it important that each procedure on the CMS-1500 be matched with a diagnosis code?
 - a. It proves the procedure was performed
 - b. It keeps the coder employed
 - c. It increases the reimbursement amount
 - d. It proves medical necessity for the procedure
 - e. It truly does not matter
9. (LO 17.7) Which of the following is the most common method for medical practices to submit electronic medical claims to third-party payers?
 - a. Paper claims via US mail
 - b. DDE
 - c. Direct submission
 - d. Clearinghouse
 - e. DDE and paper claims
10. (LO 17.8) Which of the following documents provides information regarding the payer's payment (or denial) of charges received?
 - a. RA
 - b. EOB
 - c. RA or EOB
 - d. Claims register
 - e. 1505

SOFT SKILLS SUCCESS

Recall Sylvia Gonzales from the case study at the beginning of the chapter.

1. In this state, each employee's insurance plan is considered primary for him or her, which means Mrs. Gonzales's HMO is her primary payer and the \$25 copay from her last visit is now past due, because she wanted this submitted to her husband's insurance. Insurance company refused coverage because of a \$1,000 yearly deductible, which has not yet been met. How will you handle this?

2. What policies should be implemented now that you know that Mrs. Gonzales's secondary insurance will not cover her copayments until her high yearly deductible is met?

Go to PRACTICE MEDICAL OFFICE and complete the module Admin: Check In - Work Task Proficiencies.

Diagnostic Coding

CASE STUDY

PATIENT INFORMATION	Patient Name	DOB	Allergies
	Cindy Chen	7/15/19XX	NKA
PATIENT INFORMATION	Attending	MRN	Other Information
	Alexis N. Whalen, MD	324-86-542	History of depression

Cindy Chen, a 28-year-old female complaining of inability to sleep and nervousness, arrives at the office. She tested positive for HIV in 2014, although she has been asymptomatic on antiviral drugs. Currently, she lives with her aunt and is going to school to become a phlebotomist. During her interview, she says she thinks her nervousness may be due to

upcoming exams and the recurrent sore throat and tiredness she has been experiencing in the last several months.

Keep Cindy Chen in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

 **ACTIVSim**

LEARNING OUTCOMES

After completing Chapter 18, you will be able to:

- 18.1** Recall the six ways that ICD codes are used today.
- 18.2** Compare ICD-9-CM and ICD-10-CM.
- 18.3** Describe the conventions used in ICD-10.
- 18.4** Outline the steps to code a diagnosis using ICD-10-CM.
- 18.5** Explain the purpose and usage of external cause of injury and health status codes.
- 18.6** Illustrate unique coding applications for neoplasms, diabetes mellitus, fractures, signs and symptoms, poisonings, and Z codes.

KEY TERMS

- | | |
|--|---------------------------------|
| Alphabetic Index | laterality |
| category | morbidity |
| chapters | mortality |
| chief complaint (CC) | primary diagnosis |
| combination code | principal diagnosis |
| conventions | rubric |
| cross-reference | secondary diagnosis |
| diagnosis (Dx) | subcategory |
| diagnosis code | Tabular List |
| etiology | World Health Organization (WHO) |
| International Classification of Diseases | |

- IX.C.2** Describe how to use the most current diagnostic coding classification system
- IX.P.2** Perform diagnostic coding
- IX.P.3** Utilize medical necessity guidelines
- IX.A.1** Utilize tactful communication skills with medical providers to ensure accurate code selection

- 3. Medical Terminology**
 - d. Define and use medical abbreviations when appropriate and acceptable
- 4. Medical Law & Ethics**
 - f. Comply with federal, state, and local health laws and regulations as they relate to healthcare settings
- 8. Administrative Procedures**
 - c. Process insurance claims
 - (3) Perform diagnostic and procedural coding

► Introduction

Patients who come to the medical office have a variety of reasons for seeking medical care. Each of those reasons results in at least one diagnosis. The word *diagnosis*, when split into its component word parts, means “the condition of complete knowledge” (*osis*—condition, *dia*—complete, *gnos*—knowledge). When submitting claims to insurance carriers to receive reimbursement for the care the patient receives, this knowledge must be converted into numeric and alphanumeric codes, known as ICD codes. ICD stands for **International Classification of Diseases**. Prior to October 1, 2015, the diagnostic coding system was known as ICD-9-CM, which stood for the ninth edition, clinical modification. The current system, for dates of service beginning October 1, 2015, is the 10th edition, so it is named ICD-10-CM.

With the passage of the Medicare Catastrophic Coverage Act of 1988, diagnosis coding became mandatory for Medicare claims (using ICD-9), and shortly thereafter, its use was also mandated for Medicaid and commercial insurance carriers. Just as you learn medical terminology to communicate with all members of the healthcare team, as a medical assistant, it is equally important to learn the *language* of coding—in this chapter, ICD-10, and in the following chapter, the language of CPT and HCPCS procedural coding. Because insurance carriers pay claims based on the codes assigned to describe the information within the medical record (not on the medical record itself), it is vital that you understand what the codes mean and how to choose the correct code based on the information found on the encounter forms and within the patient medical record.

► The Reasons for Diagnosis Codes LO 18.1

Patients present to healthcare providers with a description of their medical problem, called their **chief complaint (CC)**, which is documented at each visit. To diagnose a patient’s condition, the practitioner follows a complex decision-making process based on the patient’s statements, an examination, and the

practitioner’s evaluation of this information. The practitioner establishes a **diagnosis (Dx)** that describes the primary condition for which a patient is receiving care. Additional conditions or symptoms that affect the patient’s management are called *coexisting conditions*, or *comorbidities*. These conditions may be related or totally unrelated to the primary condition, but if they currently affect the patient’s condition or treatment, they also must be noted in the chart, coded, and reported to the insurance carrier. The diagnoses listed on a healthcare claim form should prove medical necessity for the treatment provided.

The diagnosis is communicated to the third-party payer through a **diagnosis code** (or diagnostic code) on the healthcare claim. Until the transition, diagnosis codes used in the United States were found in the 9th edition of the clinical modification of the ICD reference, now replaced by the 10th edition; ICD-10. Also available on CD-ROM, the ICD code set is based on a system maintained by the **World Health Organization (WHO)** of the United Nations.

The Health Insurance Portability and Accountability Act (HIPAA) mandates ICD code use in the healthcare industry for reporting patients’ diseases and conditions, or their signs and symptoms if no actual diagnosis has been assigned. The codes are updated every year on October 1, which explains why ICD-10 was effective October 1, 2015 instead of in January 2016 when the new procedural codes come out. It is important to remember that the edition of diagnosis codes being used is based on the date of service (DOS), not on the date the claim is submitted.

For instance, when completing claims on October 1, 2015, you would have used 2015 ICD-9 codes on a claim for services provided on September 30, 2015. However, for a claim reporting services provided on October 1, 2015, the new 2016 ICD-10 codes will have been used. Even though the new codes became effective in October 2015, they will be used until September 30, 2016 and so the manual is dated 2016. The edition published in October 1, 2016 will be dated 2017 and so on. The medical office must always have the current year’s coding reference books and should update office forms and computer programs containing diagnosis (and procedure) codes because using outdated codes will result in denied claims.

The ICD coding system was originally created for the classification of patient **morbidity** (sickness) and **mortality** (death) statistics and to provide access for medical research, education, and administration. Today, ICD codes are increasingly important and they are used for

- Facilitation of payment for medical services.
- Evaluation of utilization patterns (patient use of healthcare facilities).
- Study of healthcare costs.
- Research regarding quality of healthcare.
- Prediction of healthcare trends.
- Planning for future healthcare needs.

Keep in mind as you learn coding that just as whatever you document in a patient's health record becomes part of his or her permanent record, so does any code you assign to the patient for receipt by the insurance carrier. It also may be part of statistical reporting for communicable diseases, pregnancies, cancer diagnosis, and so on, so it is extremely important that you understand the information in the medical record that you are coding, as well as the descriptions of the codes you are assigning.

► A Basic Comparison of ICD-9-CM and ICD-10-CM LO 18.2

The ICD was originally introduced in 1893 by The International Statistical Institute as the first International List of Causes of Death, requiring physicians to better track a patient's diagnosis and medical care. The responsibility of ICD

was taken over by WHO in 1948 when morbidity causes were added in the sixth edition. ICD-9, introduced in 1975, did not allow the addition of new, more precise diagnoses that have developed over the years. There were approximately 14,200 codes in the ICD-9-CM, while the ICD-10-CM contains over 68,000 codes. This allows greater specificity for diagnosis classifications and provides expansion for new codes. This is particularly important relating to *code linkage*—between ICD diagnosis codes and the CPT procedure codes to prove the *medical necessity* of a patient's procedure or treatment (refer to the *Insurance and Billing* chapter for more information). You will learn more about CPT in the *Procedural Coding* chapter. At this time, many other countries in the world have adopted at least some version of ICD-10-CM. As with any change or update in the medical office, such as the claim update from the 4010 to the 5010 format or from paper medical records to an EHR program, the transition from ICD-9 to ICD-10 presented challenges to medical offices. The medical offices were required to not only learn the new system but also accommodate both systems during an overlap period. Table 18-1 shows basic comparisons between the two systems.

Additionally, ICD-9 also included a volume for hospitals (called volume 3), which contained procedures performed primarily in the inpatient hospital setting. Because of the increase in the number of diagnoses and hospital-based procedures codes available with ICD-10, it includes a totally separate volume for hospital procedure codes, called ICD-10-PCS (Procedural Coding System). Unless you decide to expand your training to include inpatient hospital coding, it is likely you will never use the PCS coding system.

Feature	ICD-9	ICD-10
Number of codes	14,200	68,000+
Format	3–5 characters; first character may be alpha or numeric; 2–5 are numeric	3–7 characters; first character alpha (uppercase); 2 and 3 are numeric; 4–7 may be alpha or numeric
Specificity	Limited	Expanded
Laterality	None	Has laterality
Decimal point	After 3rd character; not always used	Decimal must be used after 3rd character
Placeholder	0 as 4th digit is present when 5th digit is required	“X” used as placeholder for a nonexistent digit when 6th or 7th digit is required for code specificity
Combination codes	Some	Expanded number of combination codes
External causes of morbidity and mortality, including poisonings	E codes	Instead of a separate section, external causes are included as V01–Y99 codes
Factors influencing health status	V codes	Instead of a separate section, health status codes are included as Z00–Z99 codes

Chapter	Description	Code Range
1	Certain infectious and parasitic diseases	A00–B99
2	Neoplasms	C00–D49
3	Diseases of the blood and blood-forming organs and certain disorders involving the immune mechanism	D50–D89
4	Endocrine, nutritional, and metabolic diseases	E00–E89
5	Mental and behavioral disorders	F01–F99
6	Diseases of the nervous system	G00–G99
7	Diseases of the eye and adnexa	H00–H59
8	Diseases of the ear and mastoid process	H60–H95
9	Diseases of the circulatory system	I00–I99
10	Diseases of the respiratory system	J00–J99
11	Diseases of the digestive system	K00–K95
12	Diseases of the skin and subcutaneous tissue	L00–L99
13	Diseases of the musculoskeletal system and connective tissue	M00–M99
14	Diseases of the genitourinary system	N00–N99
15	Pregnancy, childbirth, and the puerperium	O00–O9A
16	Certain conditions originating in the perinatal period	P00–P96
17	Congenital malformations, deformations, and chromosomal abnormalities	Q00–Q99
18	Symptoms, signs, and abnormal clinical and laboratory findings; not elsewhere classified	R00–R99
19	Injury, poisoning, and certain other consequences of external causes	S00–T88
20	External causes of morbidity	V01–Y99
21	Factors influencing health status and contact with health services	Z00–Z99

ICD-10 Information

As you can see from Table 18-1, by converting to ICD-10, we jumped from 14,200 diagnosis codes available with ICD-9 to 68,000+ possibilities with ICD-10. Because of this increase in codes, the number of chapters also increased from 17 to 21 for ICD-10.

Alphabetic and Numeric Indexes

Like ICD-9, the 10th edition of ICD contains an **Alphabetic Index** of the diseases, conditions, and related terms. When coding in ICD-10, you will begin with the Alphabetic Index, in the front of the book to look up the diagnostic term, such as *appendicitis*. Once the term is identified in the Alphabetic Index, it directs you to the lists of appropriate codes in the **Tabular (numeric) List**. The ICD-10 Tabular List incorporates 21 **chapters** with the alphanumeric range for each as listed in Table 18-2. A **category**, also known as a **rubric**, has 3 characters and a **subcategory** has 4 or 5 characters, with the final code consisting of up to 7 characters. The use of the ICD-10 manual and the code characters involved will become clearer as examples are provided later in the chapter. It is

important to always look up a code in the Alphabetic Index first and then *verify* the code in the Tabular List because often the Tabular List contains specific information about the diagnosis often not found in the Alphabetic Index. Never code using only the Alphabetic Index. It is simply your start point. We will discuss this concept in more detail later in the chapter.

Characters and Specificity

Although there are similarities between ICD-9 and ICD-10, perhaps the most striking difference is the way the ICD-10 code looks in comparison to an ICD-9 code. The change in the look is directly related to the need to expand the specificity of many of the diagnosis codes and so a new format was required. All ICD-10 codes begin with an alpha character. The number of possible characters increased from 3–5 in ICD-9 to 3–7 in ICD-10. Again, the intent of the ICD-10 is to provide a more precise clinical picture of the patient and enhanced trending analysis. Table 18-3 provides an example of the increased specificity of the new coding system using the diagnosis of breast cancer.

TABLE 18-3 Example of Greater Specificity Available with ICD-10 vs. ICD-9	
ICD-9 (limited specificity)	ICD-10 (expanded specificity)
Code: 233.0 Carcinoma in situ breast (vague as to cancer type)	Code: D05.01 Lobular carcinoma in situ of right breast
	OR
	Code: D05.11 Intraductal carcinoma in situ of right breast

From the example in Table 18-3, some of the limitations of ICD-9 can be clearly seen. For example, code 233.0, which consists of only 4, all-numeric characters, only tells us the patient has carcinoma in situ of the breast—it does not tell us the type of cancer, nor does it tell us which breast is affected. In order to choose the most specific code in ICD-10, which consists of 5 characters, you need to know both the type of cancer affecting the patient and which breast is affected (replacing the 5th character 1 for these ICD-10 codes with a 2 means the patient’s cancer is affecting the left breast).

Placeholders

The ICD-9 did not incorporate a placeholder in anticipation of new codes. The ICD-10 uses an “X” to hold a place for future expansion of the code’s specificity. An example is illustrated in Table 18-4. The diagnosis statement is *Abrasion of scalp*, which points us to code *S00.01* with a notation to “check X7th.” Immediately below this code are three options, all beginning with the base code *S00.01*, followed by the placeholder of “X” followed by “A,” “D,” or “S.”

The 7th character is used to explain the encounter determination:

- “A” designates an initial encounter.
- “D” designates a subsequent encounter.
- “S” designates sequel.

If the “X” placeholder and 7th character are not present, the code will not be accepted. Keep in mind that, these “additional characters” are not optional. You must also be careful when adding characters that you do not “drop” the “X” placeholder. For example, if you dropped the “X” placeholder in coding the initial encounter for a scalp abrasion, you would end up with *S00.01A*—a code that does not exist in ICD-10 and would be rejected. You must be very detail-oriented to code efficiently and accurately.

Combination Codes

A **combination code** is one in which two diagnoses are included in one code. This may be a diagnosis with an associated secondary process (known as a manifestation) or a diagnosis with an associated complication. The ICD-9-CM accommodated only a relatively small number of combination codes, often requiring the use of multiple codes to completely code a condition, illness, or injury. The ICD-10-CM contains many more combination codes, greatly cutting down on the need for multiple codes for a single diagnosis. An example of a combination code appears in Table 18-5.

TABLE 18-4 Example of ICD-10 Placeholder, Not Available in ICD-9	
ICD-9-CM	ICD-10-CM
910.0 Face, neck, and scalp; abrasion or friction burn without mention of infection	S00.01 Abrasion of scalp (code noted to √X7th)
910.1 Face, neck, and scalp; abrasion or friction burn, infected	S00.01XA Abrasion of scalp, initial encounter S00.01XD Abrasion of scalp, subsequent encounter S00.01XS Abrasion of scalp, sequela

TABLE 18-5 Example of an ICD-10 Combination Code	
ICD-9-CM	ICD-10-CM
995.92 Severe sepsis AND 785.52 Septic shock	R65.21 Severe sepsis with septic shock

In some cases, multiple codes are also used with ICD-10 coding when appropriate. One example is coding for pregnancy and prenatal visits, which often require more than one code to describe completely.

► An Overview of ICD-10

LO 18.3

The ICD-10-CM, as stated earlier, consists of two parts: the Tabular List, known as Volume 1, and the Alphabetic Index, known as Volume 2, found at the beginning of the manual (Figure 18-1).

The correct procedure when using the ICD reference is to look up the diagnosis description in the Alphabetic Index (Volume 2) and then verify the code given by cross-referencing it in the Tabular List (Volume 1). In order to use both indices easily, you must understand the *conventions* they use.

Conventions

A list of abbreviations, punctuation, symbols, typefaces, and instructional notes appears at the beginning of ICD-10. These items, called **conventions**, provide basic guidelines for using the code set. Here are some important conventions:

- NOS. This abbreviation means “not otherwise specified,” or “unspecified.” It is used when a condition is not described in enough detail to choose a more specific code. In general, codes with NOS should be avoided unless no other option is available. The provider should be asked for more specific information to help select a more specific code, if possible. Most of the NOS codes end with the number 9.

Example:

A41.9	Sepsis, unspecified organism Septicemia NOS
--------------	---

Burn — continued foot T25.029 ✓ first degree T25.129 ✓ left T25.022 ✓ Diagnosis first degree T25.122 ✓ second degree T25.222 ✓ third degree T25.322 ✓ multiple with ankle - <i>see</i> Burn, lower, limb, multiple, ankle and foot right T25.021 ✓ first degree T25.121 ✓ second degree T25.221 ✓ third degree T25.321 ✓ second degree T25.229 ✓ third degree T25.329 ✓	Burn — continued second degree T20.29 ✓ third degree T20.39 ✓ neck — <i>see</i> Burn, neck nose — <i>see</i> Burn, nose scalp — <i>see</i> Burn, scalp second degree T20.20 ✓ third degree T20.30 ✓ hip (s) — <i>see</i> Burn, lower, limb inhalation — <i>see</i> Burn, respiratory tract caustic or corrosive substance (fumes) — <i>see</i> Corrosion, respiratory tract internal organ (s) T28.40 ✓ alimentary tract T28.2 ✓ esophagus T28.1 ✓

Tabular List

FIGURE 18-1 ICD Alphabetic Index and Tabular List.

Source: International Classification of Diseases, Tenth Revision, Clinical Modification, 2015, Complete Draft Code Set.

- **NEC.** This abbreviation means “not elsewhere classified.” It is used when the ICD-10 does not provide a code specific enough for the patient’s condition. Only use these codes when you are sure a more specific code does not exist. In general, the NEC codes end with the number 8.

Example:

E03.8 Other specified hypothyroidism

- **[] Brackets.** In the Tabular List, brackets are used around synonyms, alternative wordings, or explanations. These terms may help you pick out the correct code, but it is not mandatory that they be found in the medical record. For instance, in the example, the patient’s diagnosis may include “croup,” but it does not have to in order to use code J05.0.

Example:

J05.0 Acute obstructive laryngitis [croup]

- **[] Brackets.** Brackets that appear in the Alphabetic Index indicate that two codes will be required to completely code the diagnosis. The code in the bracket will be the secondary code.

Example:

Hydrothorax, filarial

(see also infestation, filarial) B74.9 [J91.8]

- **() Parentheses.** These are used around descriptions in the Alphabetic Index that do not affect the code—that is, non-essential or supplementary terms that may assist you in choosing the correct code.

Example:

Fleischer (-Kayser) ring (corneal pigmentation)

H18.04-

- **:** Colon. This is used in the Tabular List after an incomplete term that needs one of the terms that follow the colon to make it assignable to a given category.

Example:

I52	Other heart disorders in diseases classified elsewhere Code first underlying disease, such as: congenital syphilis (A50.5) mucopolysaccharidosis (E76.3) schistosomiasis (B65.0–B65.9) Diarrhea: dysenteric epidemic
------------	---

- **INCLUDES.** This note indicates that the entries following it further define the content of a preceding entry. In this example, in the medical record, the practitioner may refer to the patient as having acute myocarditis or subacute myocarditis; the same diagnosis code will be used for both.

Example:

I40	Acute myocarditis INCLUDES subacute myocarditis
------------	--

- **Excludes.** There are two types of Excludes notes in ICD-10. Although they both indicate that codes (diagnoses) are excluded from the code containing the note, they are used for different reasons.
- **EXCLUDES1** indicates that the code is excluded and never should be used at the same time as the code above the **EXCLUDES1** note.

Example:

I33	Acute and subacute endocarditis EXCLUDES1 acute rheumatic endocarditis (I01.1) endocarditis NOS (I38)
------------	--

- **EXCLUDES2** means “not included here.” An **Excludes2** note indicates that the condition excluded is not part of the condition represented by the code, but if documented, the patient may have both conditions at the same time. When an **EXCLUDES2** note appears under a code, it is acceptable to use both the code and the excluded code together if required by the medical record documentation. In the example, if the patient is documented as having both J03 and J35.0 together (in that order, because acute always precedes chronic conditions).

Example:

J03	Acute tonsillitis EXCLUDES2 Chronic tonsillitis (J35.0)
------------	--

- **Use additional code.** This note indicates that an additional code should be used, if available. The additional code is always listed after the primary code.

Example:

N18.6	End stage renal disease Chronic kidney disease requiring chronic dialysis Use additional code to identify dialysis status (Z99.2)
--------------	--

- **Code first underlying disease.** This instruction appears when the category is not to be used as the primary diagnosis. These codes may not be used as the first listed code on the insurance claim form; they must always be preceded by another code for the primary diagnosis. In this example, the underlying disease such as African trypanosomiasis (B56.-) or poliovirus infection (A80.-) will be listed first, followed by the meningitis code (G02).

Example:

G02	Meningitis in other infectious and parasitic diseases classified elsewhere Code first underlying disease such as: African trypanosomiasis (B56.-) poliovirus infection (A80.-)
------------	--

- **Code first, if applicable, any causal condition.** This note means that the code may be used as a primary diagnosis if the underlying, or “causal condition,” is unknown or not applicable.

Example:

N13.8	Other obstructive and reflux ureteropathy Urinary tract obstruction due to specified cause Code first, if applicable, any causal condition, such as enlarged prostate (N40.1)
--------------	--

Two other conventions to be aware of in the Tabular List are the use of bold and italicized typeface. Bold is used for all codes and titles in the Tabular List. Italicization is used for all Exclusion notes and to identify codes that are not used to describe the primary diagnosis; they are only used as secondary diagnoses.

The Alphabetic Index includes two notations you should also be aware of:

- **See Condition.** When found in the Alphabetic Index, it is meant to refer you to a different “main term” for the condition. For instance, if you look up the term *Ankle* in the Alphabetic Index, you will be directed to *See Condition*. Ankle is not a diagnosis; it is a location. Keep in mind that the diagnosis (and its main term) is “what is wrong with the patient.” The location will be used as a subterm. If the patient has a diagnosis of ankle fracture, you will look up fracture, ankle, and then type (open, closed, and so on) as the main term and condition.

Example:

Ankle—See Condition

- **See also.** If the diagnosis for the patient is cervical inflammation, the main term is *inflammation*. When you look

up *inflammation, cervix* (subterm for the location of the inflammation), you are directed to *See also* “Cervicitis.”

Example:

Inflammation

Cervix (uteri) (See also Cervicitis)

The direction “See Condition” is a directive; you must do so to locate the code. “See also” is a suggestion; you might find a better code for the diagnosis you are coding. In the case of “cervicitis,” you will find multiple codes available depending on what is causing the cervicitis. Follow all directions in ICD-10. It will make you a better coder and, in many cases, increase the reimbursement for the provider because you are giving the insurance carrier the most specific information available for the medical necessity for the services provided. Read the coding guidelines in the beginning of the manual. Broken out by section, these guidelines give very specific instructions on how to code each of the 21 chapters of the ICD-10 manual. Read and highlight this area of the manual as you learn to code—you will be glad you did.

The Alphabetic Index

As stated earlier, when coding, the Alphabetic Index is your start point (after you read the guidelines). It contains all the medical terms necessary to locate codes in the Tabular List—including common terms that are not found in the Tabular List. The index is organized by condition. To use the Alphabetic Index, think about what is wrong (the problem) and not where the problem occurred. For example, you would find the term *wrist fracture* by looking under *fracture* (the condition) and then, below it, *wrist* (the location), rather than by looking under *wrist* to find *fracture*. In fact, if you look up the word *wrist*, you will be told “See also condition,” telling you to look up the problem with the wrist.

The assignment of the correct code begins with looking up the medical term that describes the patient’s condition in the Alphabetic Index. The following example illustrates the index’s format. Each main term is printed in boldface type and is followed by its code number. For example, if the diagnostic statement is “the patient presents with blindness,” the main term *blindness* is located in the Alphabetic Index.

Blindness (acquired) (congenital) (both eyes)

H54.0

blast S05.8X-∇

color—See Deficiency, color vision

concussion S05.8X-∇

cortical H47.619

left brain H47.612

right brain H47.611

Any other terms that are needed to select correct codes are printed and indented after the main term. These terms, called *subterms*, may show the cause or source of the disease

or describe a particular type or body site for the main term. In this shortened example, the main term *blindness* is followed by multiple additional terms (some listed in the previous example), each indicating a different type—such as color blindness—for this medical condition. Additionally, when coding cortical blindness, note that each of its subterms, which denote the location in the brain cortex causing the color blindness, has its own code. When cross-referencing with the Tabular List, you will note that the main code of H54.0 represents blindness of both eyes. The characters after the decimal point further delineate the type, the causal location, and, in the case of cortical blindness, which side of the brain is affected.

Other helpful terms found in parentheses, known as *non-essential terms*, also may be shown. Nonessential terms are those that assist you in choosing the correct code, but it is not mandatory that they be present within the code description. In the example, any of the terms *acquired*, *congenital*, and *both eyes* may be in the diagnostic statement, such as “the patient presents with blindness acquired in childhood.”

Cross-references of *See* or *See also* are used frequently in ICD. If the cross-reference *See* appears after a main term, you *must* look up the term that follows the word *See* in the index. The *See* reference means that the main term where you first looked is not correct; another category must be used. In the previous example regarding color blindness, to code *Color* (blindness), you are instructed to *See* the term *Deficiency, color vision* to locate the correct code. As stated earlier, the reference *See also* is a suggestion that you may find more information looking under a different term.

The Tabular List

The Tabular List for ICD-10 consists of 21 chapters of disease descriptions and codes. In addition to chapters for each body system, it also includes a chapter for injuries related to poisonings, anaphylactic reactions, and the like; a chapter for injuries related to “external causes” (known as E codes in ICD-9); and a chapter for health encounters for healthy patients (such as for physicals and well-child visits), which were known as V codes in ICD-9. Table 18-2 outlines the list of chapters in the Tabular List for ICD-10.

The Tabular List contains very specific information in numeric sequence to back up, or expand on, the information found in the Alphabetic Index. Once you find the condition you believe is needed—your “start point”—in the Alphabetic Index, then locate in the Tabular List, the code given by the Alphabetic Index to obtain the “final destination.” This is the exact code, including any 5th, 6th, or 7th “optional” characters, required to give you the most specific, accurate diagnosis code available for the information you are given in the medical record.

Code Structure As stated earlier in the comparison between ICD-9 and ICD-10, I-10 diagnosis codes as they are commonly abbreviated, are made up of 3 to 7 alphanumeric characters. The system continues to use 3-character categories, known as **rubrics**, for diseases, injuries, and symptoms. Many of these categories are divided into 4- or 5-character

codes known as subcategories. Many codes are then further subdivided into 6- or 7-character codes to produce the final code—for example,

S90 Superficial injury of ankle, foot and toes

The appropriate 7th character is to be added to each code from category S90

A = initial encounter

D = subsequent encounter

S = sequela

S90.0 Contusion of ankle

S90.00 Contusion of unspecified ankle

S90.01 Contusion of right ankle

S90.02 Contusion of left ankle

When listed in the ICD-10, codes available using 4, 5, 6, or even 7 characters must be reported on claims because they represent the most specific diagnosis documented in the patient medical record. This is known as coding to the *highest level of specificity* and payers require it. For example, CMS rules state that a Medicare claim will be rejected when the most specific code available is not used. In the previous example, it would be incorrect to use code S90, S90.0, or even S90.00, S90.01, or S90.02 because the instructions under the rubric state that a 7th character must be added. In these examples, the most specific codes given consist of only 5 characters, so the aforementioned *placeholder* will be used in the sixth position. For an initial encounter, the final codes will look like this example:

S90.00XA	Contusion of unspecified ankle (initial encounter)
S90.01XA	Contusion of the right ankle (initial encounter)
S90.02XA	Contusion of the left ankle (initial encounter)

One other item to keep in mind is that although every ICD-10 code contains a decimal after the 3rd character, this decimal point is never placed on the insurance claim form. All diagnostic decimal points are omitted when completing an insurance claim form. Refer to the *Insurance and Billing* chapter for further information.

► Coding with ICD-10

LO 18.4

You may think that if your office uses a superbill or an EHR program to select codes, you will not need to understand coding. This is simply not true. Every diagnosis and procedure checked off on the encounter form must be verified in the medical record. EHR programs do not understand *medical necessity*—figuring out which diagnoses best explain why a specific procedure was performed. With the limited room on an encounter form, it is very possible that the most specific diagnosis code available for the patient's condition is not listed on the encounter form. It may be your responsibility to locate the “best code for the job.” If the provider uses a SOAP note format when charting (see the *Medical Records and Documentation* chapter), you can locate the diagnosis in the assessment area. If a more “free-hand” approach or “narrative” style note is used, a little detective work may be needed.

Example #1, from a Patient Medical Record:

CC: Chest and epigastric pain; feels like a burning inside. Occasional reflux.

Exam: Abdomen soft, flat without tenderness. No bowel masses or organomegaly.

Dx: Peptic ulcer.

The diagnosis is peptic ulcer.

Now, decide what the main term is for the condition or the diagnosis. For the diagnosis in Example #1, the main term is *ulcer*. The word *peptic* (stomach) describes the type of ulcer and is considered a subterm. Because there is an exact diagnosis, the pain and reflux will not be coded in outpatient facilities like physician offices. Inpatient facilities such as hospitals have different rules, and the symptoms would be coded.

Example #2, from a Patient Medical Record:

The diagnosis is sebaceous cyst of the left axilla.

Once you find the description, locate the code given for that description; it is usually to the right of the description or just below it. Verify the code in the Tabular List and be sure to read all instructions in this section because there are often more specific instructions in the Tabular List that will help you find the right code or affirm that you have the correct code; here are some examples.

1. For the first diagnosis of peptic ulcer (site unspecified), the code given is K27.9. When looking up the main code in the Tabular List, you will note that the rubric of K27 is *Peptic ulcer, site unspecified*. You then have the choice of adding 0–9 as the 4th character to complete the code. Since we have not been told whether the ulcer is with hemorrhage or perforation (or both), or whether the ulcer is acute or chronic, we will complete the code using the digit 9. Our completed code description will then read *Peptic ulcer, site unspecified, unspecified as acute or chronic, without hemorrhage or perforation*.
2. In Example #2, the sebaceous cyst, the code given as our start point is L72.3, which states *cyst, sebaceous (duct) (gland)*. In verifying in the Tabular List, rubric L72 includes the description of *Follicular cysts of skin and subcutaneous tissue*. Again, 4th-character options of 1–9 are given. Note that if a 4th character of 1 is chosen, then a 5th character of 1 or 2 must be added to complete the description. Because we are told the patient has a sebaceous cyst, we verify that L72.3 is defined as sebaceous cyst, and this is the code that will be used.

In both of these cases, the level of specificity of each diagnosis was increased by the addition of the “optional” 4th character, and we noted that in the second example, depending what type of cyst was diagnosed, a 5th character might

be required to complete the code. As we move forward we will see more codes that include 6- and 7-character codes, as well as those utilizing the placeholder “X.” As you can see, these optional characters truly are not optional at all. Finally, do not forget to look for instructions such as *Code also* and *Code first underlying condition*, as well as *Includes* and *Excludes* notes that assist you in deciding on the correct code or codes.

Additional Guidelines for ICD-10 Coding

Now that you understand that you must first look up the main term and then the subterm in the Alphabetic Index, then confirm the code in the Tabular List (a step that can never be skipped), let’s look at some guidelines in more detail that will make your coding more specific and efficient.

Acute Versus Chronic Conditions An acute (including subacute for coding purposes) condition is defined as one that is of sudden onset or a more long-standing (chronic) condition that has suddenly worsened. There are times, such as with bronchitis, when the patient has both the acute form (J20.9) and the underlying chronic form (J42). When this occurs and both codes must be reported, the acute code is always listed first, followed by the code for the chronic form of the condition.

Combination Codes When a combination code is available, it must be used in place of the two single codes. An example of this is cholelithiasis (gallstones), code K80.20, with acute cholecystitis (gallbladder inflammation), code K81.9. However, because they are being diagnosed together, when you look up *cholecystitis* and see the subterm “with,” you will find a direction stating “See Calculus, gallbladder, with cholecystitis.” When you do so, you will note that cholelithiasis with cholecystitis, acute, is coded K80.10 with a notation to check the 5th character. You are given two options: 0 represents *Calculus of the gallbladder with chronic cholecystitis without obstruction*. 1 represents *Calculus of the gallbladder with chronic cholecystitis with obstruction*. Because there is no mention of obstruction in our diagnosis, the correct full code is K80.10. One other note on acute versus chronic conditions: If the condition is not defined as acute or chronic and the provider cannot be located to provide this detail, the assumption is that the condition is chronic. See Figure 18-2.

Multiple Coding Prior to the ICD-10 code set, there were many instances when one code did not fully describe the patient’s diagnosis. With ICD-10, this happens less often, but there are still times when more than one code will be required to fully “explain” the patient’s condition. This most often occurs when a disease or condition is the manifestation (result) of another condition. For instance, if a patient is diagnosed with otitis externa of the right ear, caused by impetigo, two codes will be required because the otitis is caused by the underlying condition of the impetigo. When you look up otitis externa in the Alphabetic Index, follow the subset “in (due to),” and locate impetigo, you will note code L01.00 followed

FIGURE 18-2 (a) Alphabetic Index for cholecystitis directing you to calculus, gallbladder. (b) Alphabetic Index showing calculus with cholecystitis (K80.10). (c) Tabular List for K80.10 verifying correct description of calculus of gallbladder with chronic cholecystitis without obstruction. Source: International Classification of Diseases, Tenth Revision, Clinical Modification, 2015, Complete Draft Code Set.

by a code in brackets: [H62.40]. Remember from the conventions discussed earlier in the chapter that codes in brackets must follow the primary code. See Figure 18-3a.

When verifying the code choices in the Tabular List, first look up L01.00 for impetigo. Note that you have five choices, all utilizing 5 characters for types of impetigo. Because you

FIGURE 18-3 (a) Alphabetic Index for otitis externa in impetigo. (b) Tabular List for impetigo, unspecified. (c) Tabular List for otitis externa in diseases classified elsewhere. (d) Final coding order for otitis externa of the right ear due to impetigo.

Source: International Classification of Diseases, Tenth Revision, Clinical Modification, 2015, Complete Draft Code Set.

have no specific information as to the type, you will choose L01.00, Impetigo, unspecified. See Figure 18-3b.

Now look up the code in brackets: H62.40. Note that under the classification of H62.4, *Otitis externa in other diseases classified elsewhere*, you are instructed to “Code first underlying disease, such as: erysipelas (A46), impetigo (L01.0).” Also note your 5th-character choices for the otitis codes: 0 = unspecified ear, 1 = right ear, 2 = left ear, and 3 = bilateral ears (Figure 18-3c).

Because your patient diagnosis is with the right ear, you will use code H62.41. As you have been instructed, the correct order for these codes will be L01.00 (Impetigo) first followed by H62.41 (Otitis externa, right ear), as shown in Figure 18-3d.

Remember that 4th, 5th, 6th, and 7th characters, when provided, are not optional and must be used when given. See Figure 18-4 for examples of each.

Other diseases caused by chlamydiae (A70-A74)

Coding Unclear Diagnoses

Practitioners frequently do not have an exact diagnosis documented. Terms such as *probable*, *suspected*, *likely*, *questionable*, *possible*, or *rule out* flag a diagnosis as being uncertain. Outpatient coding rules require that unclear diagnoses be coded using the symptoms that led the patient to seek care, until an absolute diagnosis is made. The rules are different for inpatient coding.

Example:

Diagnosis: Nonproductive cough and fever,
Rule out bronchitis
Outpatient diagnosis: Cough (R05)
Fever (R50.9)

A similar situation occurs with “impending” or “threatened” conditions. If the condition actually occurs, code it as a confirmed diagnosis. If it did not occur, check to see if a code exists for the threatened condition, and if it exists, use it. If it does not exist, code the underlying conditions or symptoms as if the condition did not exist.

Example:

Diagnosis: Hemorrhage in early pregnancy
with threatened abortion
ICD: O20. Hemorrhage in early pregnancy
O20.0 Threatened abortion

Use code O20.0, as it describes exactly the diagnosis given. One word of caution is in order regarding diagnosis codes from ICD-10 Chapter 15, *Pregnancy, Childbirth, and the Puerperium*: Remember that ICD-10 codes always begin with a letter. The first character in this chapter is an “O,” not a zero (0). Now that you have the foundation to begin using the ICD manual, Procedure 18-1 at the end of this chapter outlines the steps for locating an ICD-10-CM code.

Principal Versus Primary Diagnosis

The **principal diagnosis** is defined by the Uniform Hospital Discharge Data Set (UHDDS) as “that condition established after study to be chiefly responsible for occasioning the admission of the patient to the hospital for care.” Outpatient coding does not generally use principal diagnoses; instead, it uses the **primary diagnosis**, defined as the main reason for the patient’s visit. The **secondary** (or subsequent) **diagnoses** are other conditions that are also affecting the patient at the time of the visit and so are coded after the primary diagnosis.

Diagnosis-Related Groups and IP Coding

Unlike outpatient claims where payment is often based on the procedure performed, inpatient claims are paid based on a system known as *Diagnosis-related groups*, or *DRGs*. There are over 700 DRGs, which are based on four elements: principal diagnosis; other diagnoses; significant procedures performed; and the age, sex, and discharge status of the patient. As a medical assistant, you will probably never assign a DRG, but the information you give to the

admitting clerk regarding the patient’s condition on admission can affect the DRG assigned, so you must be thorough and accurate in the information you give regarding your patients.

► External Cause of Injury and Health Status Codes

LO 18.5

Earlier versions of ICD contained two “extra” chapters at the end of the Tabular List. One was the external cause chapter, known as E codes because they all began with the first character E. E codes were supplemental codes used to describe how an injury or illness occurred when caused by an accident or poisoning. The last chapter, known as V codes because they all began with the character V, were for health-care visits classified as “Supplementary Classification of Factors Influencing Health Status and Contact with Health Services.” This very long title was (and is) for codes describing patients who are not currently ill but come to the office for reasons including history of an illness (personal or family); preventive medicine (such as immunizations and physical exams); employment, school, and camp exams; well-baby care; contraception; screenings; aftercare (such as postsurgical care); carrier status; organ donor; testing for status; and so on. ICD-10 made these codes part of the Tabular List and split the external cause codes into two chapters: Chapter 19, *Injury, Poisoning, and Certain Other Consequences of External Causes*. These are the codes that answer “how” an injury or poisoning occurred. For instance, if you see a friend on crutches and he tells you he broke his ankle, naturally your question would be “How did you do that?” Whatever answer he gives you provides the information for using a code or codes from Chapter 19 to act as a secondary code(s) to the primary code describing his fractured ankle. Codes in Chapter 19 begin with the letter “S” or “T.” Chapter 20 is the *External Causes of Morbidity* chapter. Chapter 20 codes begin with the letter “V,” “W,” “X,” or “Y.” External cause codes are not required by all payers but are intended to provide data for injury research and evaluation of injury prevention strategies.

Chapter 21 in ICD-10 contains the *Supplementary Classification of Factors Influencing Health Status and Contact with Health Services*. Because the codes in this chapter begin with the letter “Z,” they are now sometimes referred to as “Z codes.” Let’s look at both of these accident and “well” visits in a bit more detail. For conciseness, we will simply call codes from this chapter health status codes.

Health Status Codes

Because the patient is basically “healthy,” Z codes are generally used in the outpatient setting. Examples of common health status codes include the following:

- Z23: Encounter for vaccination (remember this is a diagnosis, not a procedure code)
- Z51.11: (Encounter for) Chemotherapy treatment

(The patient does have cancer, but the reason for the visit today is the chemotherapy administration. This will be followed by the appropriate code for the neoplasm being treated.)

- Z88.0: History (personal) of allergy to penicillin
- Z37.0: Vaginal delivery of single, live-born newborn (status of the newborn child for the mother's medical record)

Z codes are coded via the same Alphabetic Index as the other ICD-10 codes. For the preceding examples, the key terms *vaccination*, *encounter*, *history*, and *outcome of delivery* will be italicized in the Alphabetic Index. Their Tabular List for verification is located in Chapter 21 at the end of the Tabular List. Procedure 18-2 outlines the procedure for locating a Z code.

External Cause Codes

Because coding external cause (T, V, and Y) codes can be complicated, let's focus on getting acquainted with the basic concepts first. Some of the major categories of these codes include transport accidents; poisonings and adverse effects; accidental falls; accidents from fire and flames; accidents due to natural and environmental factors; late effects of accidents; assaults or self-injury; assaults or purposely inflicted injury and suicide; and self-inflicted injury. Both the Table of Drugs and Chemicals and the Alphabetic Index for external cause codes are found at the end of the main Alphabetic Index for ICD-10 codes. Now, let's discuss some specifics for the general use of these codes.

General Use of External Cause Codes External cause codes are used with any diagnosis code from 001–V84.4, except for CMS (Medicare), which does not require these codes on its claim forms. In general, external cause codes are only used for the initial treatment for an acute illness or injury, and not for subsequent visits. The exception to this rule is treatment for acute fractures. In this case, use the external cause code for as long as acute treatment of the fracture is taking place. Use as many external cause codes as necessary to completely explain how the incident occurred. For instance, if a patient accidentally overdoses on a combination of alcohol and Valium®, at least two codes will be necessary to explain the overdose of both substances. Another example may relate to your friend with the broken ankle. Two external cause codes may be applicable. If he was at work and fell from scaffolding while painting a house, two codes would be necessary for the initial encounter—fall from scaffolding (W12.XXXA) and a place of occurrence code denoting that the accident took place at a private residence (Y92.009).

Place of occurrence codes are found under the key term of *place*. All accidents occurring while using machinery or any type of motorized vehicle (including boats, motorcycles, ATVs, and heavy machinery) require an external cause code describing the vehicle involved in the accident. Many of these codes contain a 4th character that describes

the person injured, such as the driver (0), passenger (1), person outside the vehicle (3), person boarding or alighting the vehicle (4), and so on. Always use the code bringing the highest level of specificity. Many of these codes also require a 7th character describing the type of encounter for the visit.

A—initial encounter

D—subsequent encounter

S—sequela

Be careful when adding these 7th characters. Be sure to use the placeholder X as needed. For instance, with the example of your friend who fell from the scaffolding, the base code is W12 with a note to add the 7th character for the encounter. Did you notice that in order to put the A for the initial encounter in the correct location, three X placeholders were required: W12.XXXA?

Poisonings and Adverse Effects The Table of Drugs and Chemicals is located directly after the Alphabetic Index. The table consists of a row for each drug name and then six columns with the following titles: Poisoning, Accident, Therapeutic Use, Suicide Attempt, Assault, and Undetermined. Refer to the poisoning column when the medical record states “poisoning,” “overdose,” “wrong substance given or taken,” or “intoxication.” ICD-9 coding required at least two codes for poisonings, first a code describing the poisoning and then an E code to describe how the poisoning took place. ICD-10 has created combination codes for poisonings so that in many cases only one code will be required. If the patient has a secondary symptom due to the poisoning, such as vomiting, this will be coded as secondary to the poisoning code, which will be a T code from Chapter 19. The following definitions will be helpful when deciding which column to use when choosing the correct type of poisoning code using the Table of Drugs and Chemicals:

- Poisoning, Accidental (unintentional). This column is used for accidental overdose, wrong substance given or taken, drug taken by mistake, accidental drug usage, and accidents in drug usage in a medical facility.
- Poisoning, Intentional (self-harm). This column is used when the patient intentionally intended to harm him- or herself (suicide attempt).
- Poisoning, Assault. This column is used when it has been determined that the patient was intentionally harmed by or poisoned by another person with the intent to injure or kill the patient.
- Poisoning, Undetermined. These codes are to be used when the intent of the poisoning or injury cannot be determined.
- Adverse effect. This column is used when the correct substance is properly administered in the correct dosage but caused a poisoning or other adverse effect.
- Underdosing. This column is used as a *secondary* diagnosis when the patient is taking less of a medication than

is prescribed, causing or exacerbating a medical condition, which would be the primary code. If noncompliance or care is complicated because of the underdosing, these issues may also be coded.

Examples:

# 1 Diagnosis:	Hives (urticaria) due to newly diagnosed Penicillin allergy (taken as prescribed); initial encounter
ICD-10 Codes:	T36.0X5A Adverse effect of Penicillins and L50.0 Urticaria due to drugs (allergic)
# 2 Diagnosis:	Vomiting due to intentional overdose of Valium; subsequent encounter
ICD-10 Codes:	T42.4X2D Poisoning, intentional (self harm) by benzodiazepines and R11.10 Vomiting, unspecified

Burns Coding burns typically requires three codes: the degree of the burn (if there are multiple burns, they are sequenced with the highest degree first); the extent (percentage of the body burned); and the external cause code for how the burn occurred. To code burns, first use the key term *Burn*, then find the indented subterm for the burn location, and, finally, use the subclassification for the extent of the burn (1st, 2nd, or 3rd degree). Locations with multiple burn degrees are coded to the highest extent of the burn. Once that code is completed, return to the key term *Burn* and subterm *Extent*. Using the Rule of Nines, found in the Tabular List at the beginning of the T31 section, calculate the percentage of the body burned. Finally, locate the external cause code description from the Alphabetic Index for External Cause Codes and verify it in the Tabular List.

Example:

Diagnosis:	Patient presents with 1st and 2nd degree burns to right hand and wrist from boiling water; initial encounter
ICD-10 Codes:	T23.201A (1st & 2nd degree burn right hand and wrist), T31.0 (less than 10% of body surface burned) and X12.XXXA (Contact with other hot fluids)

Always remember that external cause codes are never the primary or first diagnosis listed. When used, they are listed after the primary (or secondary) diagnosis to which they relate. More than any other type of diagnosis code, external cause codes require practice to get perfect. Procedure 18-3 found at the end of the chapter outlines how to code using external cause codes.

► Synopsis of ICD-10 Coding Guidelines by Chapter LO 18.6

You now have a basic idea of how to use the ICD-10 manual and locate and verify an ICD-10 code. The majority

of ICD-10 codes follow the general guidelines. However, unique coding applications also exist. These include but are not limited to neoplasms, diabetes mellitus, fractures, pregnancy, external causes of morbidity and mortality, R codes (abnormal findings), poisonings, and expanded Z codes (formerly V codes). In this section we are going to take a quick look at the unique guidelines for some of the chapters in ICD-10, to allow you to better understand how to code correctly and efficiently with the ICD-10 manual.

Chapter 1: Certain Infectious and Parasitic Diseases (A00–B99)

In an outpatient setting, requesting a confirmatory serology or culture for HIV is not enough to code HIV positivity. Only a diagnostic statement such as “known HIV” or “positive HIV” is adequate from the provider. When no definitive diagnosis or manifestation of HIV is present and the patient has an inconclusive serology, code R75, inconclusive laboratory evidence of human immunodeficiency virus, should be assigned. Patients who have had a positive serology or culture and have developed an HIV-related illness should be assigned code B20 on every encounter. Patients who are HIV positive but asymptomatic in status should be assigned code Z21. This code should be assigned for all patients with the diagnostic statement of positive HIV. When a patient presents with any signs or symptoms while being seen for HIV testing, code only the signs and symptoms. If counseling is provided during the same encounter, an additional counseling code out of Z71.7 may be reported.

Chapter 2: Neoplasms (C00–D49)

Chapter 2 of ICD-10-CM deals with neoplasms. To assign a proper code, first remember that all cancers are found under the term *neoplasm* and that the documentation of the neoplasm must state whether it is benign, malignant, in situ, or of uncertain behavior. Found in the Table of Neoplasms, neoplasms are listed alphabetically by anatomical location such as breast or bone. Each site may further be broken down to a certain area. In the case of a bone neoplasm, in order to code the diagnosis, you must know in which bone (rib, femur, vertebra, etc.) the neoplasm has been found. When coding malignant neoplasms, the primary site is the location where the cancer originated. The secondary, or metastatic, sites are the areas to which the cancer or malignancy has spread. Once the site and type of the neoplasm are identified, any additional instructions for coding must be observed. An additional code, such as one identifying exposures to carcinogenic (cancer-causing) substances that may be the underlying cause of the patient’s cancer diagnosis, may be required. Two examples of carcinogens as underlying causes are exposure to tobacco smoke (Z77.22) and exposure to tobacco smoke in the perinatal period (P96.81).

The correct coding and sequencing of neoplasms is critical. If the treatment is directed at the primary neoplasm, that code is used as the principal (or primary) diagnosis. If the neoplasm has metastasized and the patient’s treatment is for the secondary site, then the secondary neoplasm becomes

the primary diagnosis. If chemotherapy, radiation therapy, or immunotherapy—although each is generally considered a procedure and not a diagnosis—is the primary reason for medical care, it is coded first (and linked to the appropriate procedure), followed by the code for the malignancy being treated.

Chapter 4: Endocrine, Nutritional, and Metabolic Diseases (E00–E89)

Chapter 4 contains the codes for diabetes mellitus. Codes for diabetes mellitus are combination codes that include the type of diabetes:

- Type 1—insulin-dependent diabetes (IDDM), sometimes referred to as juvenile diabetes
- Type 2—noninsulin-dependent diabetes (NIDDM)

In addition to the type of diabetes which must be documented as type 1 or type 2, the body system affected by diabetes and the condition affecting the anatomical structure are included. When the type of diabetes is not documented in the medical record (and the provider cannot be queried), then the patient should be assigned a code for Type 2 diabetes mellitus. In many cases one code will identify both the type of diabetes and its manifestation. For instance, if a patient with Type 2 diabetes is discovered to have retinopathy without macular edema, the code of E09.319 will completely code his condition. If, however, the patient's diabetes is caused by another underlying factor, two codes will be needed. Look at Figure 18-5. The first code will identify the underlying

condition, for instance, Cushing's syndrome (E24.-) followed by the appropriate code for the type of diabetes from category E08. Do note also that the Cushing's syndrome code will require additional digits as noted in the Alphabetic Index by the dash after the decimal point.

Chapter 5: Mental and Behavioral Disorders (F01–F99)

When patients experience pain, whether acute or chronic, it should be documented if the pain is exclusively psychological. Pain that is associated with and is exclusively psychological should be assigned code F45.41, pain disorder with related psychological factors, followed by the appropriate code from the category G89.

Chapter 6: Diseases of the Nervous System (G00–G99)

The nervous system chapter in ICD-10 no longer includes the eye and ear; they have each been given an individual chapter (7 and 8); otherwise, the coding for the nervous system has changed very little since ICD-9. As stated earlier, code G89 is used for pain diagnoses. This code may be used as a first-listed diagnosis when the reason for the encounter is the treatment of the pain. If the patient is seen for a definitive diagnosis (such as cancer) and pain is also noted, then the definitive diagnosis should be listed first, followed by the most specific pain code possible. If malignant neoplasm is the underlying cause of the pain, the appropriate pain code is G89.3.

Diabetes mellitus (E08-E13)

E08 Diabetes mellitus due to underlying condition

Code first the underlying condition, such as:

congenital rubella (P35.0)
Cushing's syndrome (E24.-)
cystic fibrosis (E84.-)
malignant neoplasm (C00-C96)
malnutrition (E40-E46)
pancreatitis and other diseases of the pancreas (K85-K86.-)

Use additional code to identify any insulin use (Z79.4)

Excludes1: drug or chemical induced diabetes mellitus (E09.-)

gestational diabetes (O24.4-)
neonatal diabetes mellitus (P70.2)
postpancreatectomy diabetes mellitus (E13.-)
postprocedural diabetes mellitus (E13.-)
secondary diabetes mellitus NEC (E13.-)
type 1 diabetes mellitus (E10.-)
type 2 diabetes mellitus (E11.-)

E08.0 Diabetes mellitus due to underlying condition with hyperosmolarity

E08.00 Diabetes mellitus due to underlying condition with hyperosmolarity without nonketotic hyperglycemic-hyperosmolar coma (NKHHC)

E08.01 Diabetes mellitus due to underlying condition with hyperosmolarity with coma

E08.1 Diabetes mellitus due to underlying condition with ketoacidosis

E08.10 Diabetes mellitus due to underlying condition with ketoacidosis without coma

FIGURE 18-5 Diabetes mellitus codes with underlying conditions using ICD-10 2016 version from CMS.gov website.

Source: 2016 version from CMS.gov website, <https://www.cms.gov/Medicare/Coding/ICD10/2016-ICD-10-CM-and-GEMs.html>

Chapter 9: Diseases of the Circulatory System (I00–I99)

ICD-10 uses the hypertension table in the Alphabetic Index, and the rules for coding hypertension have not changed since ICD-9. Primary hypertension, also known as essential hypertension, is coded as I10. When hypertension is caused by an underlying condition (secondary hypertension), two codes are required—the first to identify the underlying **etiology** (cause) and the second to code the hypertension. A patient who has elevated blood pressure may not necessarily have a diagnosis of hypertension. This is known as transient hypertension, and the code R03.0 should be assigned.

Chapter 10: Diseases of the Respiratory System (J00–J99)

Coding within the respiratory system is not difficult as long as you continue to follow the basic guidelines and the guidelines within the chapter. It should be noted, however, that positive laboratory documentation is not required in order to code either novel A or H1N1 influenza as a diagnosis. When the provider's documentation states “suspected or probable” novel A influenza or H1N1 influenza, codes should be assigned as if the condition existed (J09.0 category). Documentation of any another type of influenza should be assigned codes from the J10 category. Figure 18-6 shows the difference in the Tabular List between novel A influenza codes and descriptions and those for influenza due to other influenza virus. Note that manifestations of novel A and H1N1 virus are included in the code descriptions.

Chapter 13: Diseases of the Musculoskeletal System and Connective Tissue (M00–M99)

This chapter contains the categories for fractures, which are coded quite differently in ICD-10 than they were in ICD-9. **Laterality** (which describes the side of the body affected by the diagnosis) for fractures is new and designated as follows:

- Unilateral—4th character “1”
- Laterality designated by—5th character:
 - 0—unspecified
 - 1—right
 - 2—left

Another major change in ICD-10 is the addition of a 7th character designating the type of encounter for which the patient is being seen. Coding pathological fractures due to osteoporosis includes this 7th character. Shown in Figure 18-7 are the six capital letters used for this mandatory 7th character.

For the purposes of these 7th-character extensions, the term *initial* means an active fracture that is still healing, *subsequent* defines follow-up after the active fracture care,

and *sequela* refers to care after the injury has healed, but there are now different issues related to the initial injury that must be attended to. To better understand the coding concepts within this section, let's take a look at Figure 18-8 for a patient who has age-related osteoporosis with a current pathological fracture of the right shoulder. Based on the information in Figure 18-8, the code would be M80.011; however, because of the information you received on the necessary 7th characters (see Figure 18-7), you know that if the patient had a subsequent visit for the fracture as a routine checkup for a healing fracture, you would use the code M80.011D.

Chapter 14: Diseases of the Genitourinary System (N00–N99)

ICD-10 provides for four stages of chronic kidney disease (CKD). Code N18.1 is the beginning stage; N18.2, mild CKD; N18.3, moderate CKD; and N18.4, severe CKD. If end-stage renal disease (ESRD) is documented, use code N18.6. This code will be used alone, even if both chronic kidney disease and end-stage renal disease are documented. Keep in mind that kidney transplant (Z94.0—kidney transplant status) may not totally restore kidney function, so both Z94.0 and a code for chronic kidney disease, if still present, may be coded.

Chapter 15: Pregnancy, Childbirth, and the Puerperium (O00–O9A)

When coding pregnancy-related diagnoses, ICD-10 often requires a 7th character (the highest specificity for the system). With many codes, the 7th character specifies the trimester of the pregnancy in which the condition occurs. Read these descriptions carefully. If the patient is in a different trimester than the one stated, you must look for a different code. With codes describing pregnancy conditions related to multiple gestation, the 7th digit specifies the number of fetuses in utero. Maternity coding can be complicated, but thorough reading of the medical record documentation and understanding of the coding guidelines specific to this chapter will allow optimal confidence in coding.

Chapter 17: Congenital Malformations, Deformations, and Chromosomal Abnormalities (Q00–Q99)

Codes from this chapter are used exclusively when a patient's medical record documents that the diagnosis or condition is congenital or chromosomal in nature. Codes Q00–Q99 may be listed as either primary or secondary diagnoses, depending on the guidelines given within the coding instructions. Diseases and conditions in this section include hydrocephalus, spina bifida, atrial septal defect, limb malformations and deformities, cleft lip/palate, trisomy 21 (Down syndrome), and many others.

J09 Influenza due to certain identified influenza viruses Excludes1: influenza due to other identified influenza virus (J10.-) influenza due to unidentified influenza virus (J11.-) seasonal influenza due to other identified influenza virus (J10.-) seasonal influenza due to unidentified influenza virus (J11.-) J09.X Influenza due to identified novel influenza A virus Avian influenza Bird influenza Influenza A/H5N1 Influenza of other animal origin, not bird or swine Swine influenza virus (viruses that normally cause infections in pigs) J09.X1 Influenza due to identified novel influenza A virus with pneumonia Code also, if applicable, associated: lung abscess (J85.1) other specified type of pneumonia J09.X2 Influenza due to identified novel influenza A virus with other respiratory manifestations Influenza due to identified novel influenza A virus NOS Influenza due to identified novel influenza A virus with laryngitis Influenza due to identified novel influenza A virus with pharyngitis Influenza due to identified novel influenza A virus with upper respiratory symptoms Use additional code, if applicable, for associated: pleural effusion (J91.8) sinusitis (J01.-) J09.X3 Influenza due to identified novel influenza A virus with gastrointestinal manifestations Influenza due to identified novel influenza A virus gastroenteritis 'intestinal flu' [viral gastroenteritis] (A08.-) J09.X9 Influenza due to identified novel influenza A virus with other manifestations Influenza due to identified novel influenza A virus with encephalopathy Influenza due to identified novel influenza A virus with myocarditis Influenza due to identified novel influenza A virus with otitis media Use additional code to identify manifestation

(a)

J10 Influenza due to other identified influenza virus Excludes1: influenza due to avian influenza virus (J09.X-) influenza due to swine flu (J09.X-) influenza due to unidentified influenza virus (J11.-) J10.0 Influenza due to other identified influenza virus with pneumonia Code also: associated lung abscess, if applicable (J85.1) J10.00 Influenza due to other identified influenza virus with unspecified type of pneumonia J10.01 Influenza due to other identified influenza virus with the same other identified influenza virus pneumonia J10.08 Influenza due to other identified influenza virus with other specified pneumonia Code also: other specified type of pneumonia J10.1 Influenza due to other identified influenza virus with other respiratory manifestations Influenza due to other identified influenza virus NOS Influenza due to other identified influenza virus with laryngitis Influenza due to other identified influenza virus with pharyngitis Influenza due to other identified influenza virus with upper respiratory symptoms Use additional code for associated pleural effusion, if applicable (J91.8) Use additional code for associated sinusitis, if applicable (J01.-) J10.2 Influenza due to other identified influenza virus with gastrointestinal manifestations Influenza due to other identified influenza virus gastroenteritis EXCLUDES 1 'intestinal flu' [viral gastroenteritis] (A08.-) J10.8 Influenza due to other identified influenza virus with other manifestations J10.81 Influenza due to other identified influenza virus with encephalopathy J10.82 Influenza due to other identified influenza virus with myocarditis J10.83 Influenza due to other identified influenza virus with otitis media Use additional code for any associated perforated tympanic membrane (H72.-) J10.89 Influenza due to other identified influenza virus with other manifestations Use additional codes to identify the manifestations

(b)

FIGURE 18-6 (a) Tabular List for influenza due to avian influenza virus and (b) Tabular List for influenza due to other influenza virus 2016 version from CMS.gov website.

Source: 2016 version from CMS.gov website, <https://www.cms.gov/Medicare/Coding/ICD10/2016-ICD-10-CM-and-GEMs.html>

M.80 Osteoporosis with current pathological fracture
Includes: osteoporosis with current fragility fracture
Use additional code to identify major osseous defect, if applicable (M89.7–)
Excludes1: collapsed vertebra NOS (M48.5)
 pathological fracture NOS (M84.4)
 wedging of vertebra NOS (M48.5)
Excludes 2: personal history of (healed) osteoporosis fracture (Z87.310)
 The appropriate 7th character is to be added to each code from category M80:
 A – initial encounter for fracture
 D – subsequent encounter for fracture with routine healing
 G – subsequent encounter for fracture with delayed healing
 K – subsequent encounter for fracture with nonunion
 P – subsequent encounter for fracture with malunion
 S – sequela

FIGURE 18-7 Codes and the 7th characters for osteoporosis with pathological fracture 2016 version from CMS.gov website.

Chapter 18: Signs, Symptoms, and Abnormal Clinical and Laboratory Findings (NEC) (R00–R99)

Chapter 18 is primarily used to code for the following types of conditions:

- Cases that do not have a more specific diagnosis after all the findings are analyzed
- Transient signs and symptoms at the initial encounter with undetermined cause
- Provisional diagnosis in a patient not returning for further care
- Cases without a definitive diagnosis referred elsewhere
- Cases in which a definitive diagnosis could not be determined
- Additional information that represents a significant but currently asymptomatic medical problem (such as an asymptomatic HIV-positive patient)

There are multiple combination codes available in this chapter. Watch for them and follow guidelines for their use. If a combination code is available, it must be used to avoid unbundling the code.

Chapter 19: Injury, Poisoning, and Certain Other Consequences of External Causes (S00–T88)

As stated earlier in the chapter, the 7th-character extension is used extensively in this chapter for poisonings. You will also note that because poisoning codes require specificity, the “X” placeholder is often found in the 5th position, the 6th character 1–6 describes how the poisoning took place, and then a 7th character A (initial), D (subsequent), or S (sequela) is used to describe the type of encounter. An illustration for the substance sulfonazide is in Table 18-6.

Note that the table does not give you the 7th-character options. This is a perfect example of why you must always verify codes in the Tabular List to obtain the entire correct code. If a 7th character is required and is not in place, the insurance carrier will not accept the code. For any of the poisoning codes for sulfonazide to be complete, the letter, A, D, or S will have to be added to the code describing the encounter as initial, subsequent, or a sequela.

Burns and Corrosions Always remember that burns are classified by three factors: depth of the burn (first-degree, second-degree, or third-degree), the extent (total body area—based on the rule of nines), and the agent (fire, thermal, or appliance). Burns that are caused by a corrosive material are coded the same as any burn with the additional code for the corrosive material being sequenced first. It is also important to note that if the same area of the body sustains multiple burn degrees, the area should be coded as the most extensive degree listed. For instance, if the left foot sustains both

TABLE 18-6 Excerpt from ICD-10 Table of Drug and Chemicals for the Substance Sulfonazide

Substance	Poisoning Accidental	Poisoning Intentional	Poisoning Assault	Poisoning Undetermined	Adverse Effect	Underdosing
Sulfonazide	T37.1X1	T37.1X2	T37.1X3	T37.1X4	T37.1X5	T37.1X6

first- and second-degree burns, code the entire foot as a second-degree burn.

Chapter 20: External Causes of Morbidity (V00–Y99)

Codes within this chapter identify who, what, when, and where an accident or injury occurred. They are used for data in determining research and prevention strategies for injuries. These codes may be used as secondary codes to describe health conditions and are applicable for categories A00–T88.9 and Z00–Z99. Figure 18-9 shows some of the categories for these secondary codes, previously referred to as E codes in ICD-9. The use of these codes should completely identify the patient's cause of injury. An example would be a sprained ankle while playing football. The cause of the injury is a fall, the activity is football, and the location is the playground at the time of injury. When assigning multiple external cause codes, the code indicating the cause or intent, or medical misadventure, is reported before the code for the place, activity,

or external status codes. When reporting multiple causes of injuries, codes for child and adult abuse take priority over all other external cause codes. Read the guidelines carefully.

Chapter 21: Factors Influencing Health Status and Contact with Health Services (Z00–Z99)

As explained earlier in the chapter, the unique ICD-9 V codes (used to code for healthcare encounters other than injury or illness, such as prenatal care or administration of immunizations) were replaced by Chapter 21, *Factors Influencing Health Status and Contact with Health Services*, Z00–Z99 in ICD-10. In addition to the usual “well” visits thought of in this section, the following reasons for healthcare encounters are included in this section:

- Chemotherapy, radiation therapy, and immunotherapy
- Aftercare
- Administrative exams (such as a sports physical)

V00-X58	Accidents
V00-V99	Transport accidents
V00-V09	Pedestrian injured in transport accident
V10-V19	Pedal cycle rider injured in transport accident
V20-V29	Motorcycle rider injured in transport accident
V30-V39	Occupant of three-wheeled motor vehicle injured in transport accident
V40-V49	Car occupant injured in transport accident
V50-V59	Occupant of pick-up truck or van injured in transport accident
V60-V69	Occupant of heavy transport vehicle injured in transport accident
V70-V79	Bus occupant injured in transport accident
V80-V89	Other land transport accidents
V90-V94	Water transport accidents
V95-V97	Air and space transport accidents
V98-V99	Other and unspecified transport accidents
W00-X58	Other external causes of accidental injury
W00-W19	Slipping, tripping, stumbling and falls
W20-W49	Exposure to inanimate mechanical forces
W50-W64	Exposure to animate mechanical forces
W65-W74	Accidental non-transport drowning and submersion
W85-W99	Exposure to electric current, radiation and extreme ambient air temperature and pressure
X00-X08	Exposure to smoke, fire and flames
X10-X19	Contact with heat and hot substances
X30-X39	Exposure to forces of nature
X52-X58	Accidental exposure to other specified factors
X71-X83	Intentional self-harm
X92-Y08	Assault
Y21-Y33	Event of undetermined intent
Y35-Y38	Legal intervention, operations of war, military operations, and terrorism
Y62-Y84	Complications of medical and surgical care
Y62-Y69	Misadventures to patients during surgical and medical care
Y70-Y82	Medical devices associated with adverse incidents in diagnostic and therapeutic use
Y83-Y84	Surgical and other medical procedures as the cause of abnormal reaction of the patient, or of later complication, without mention of misadventure at the time of the procedure
Y90-Y99	Supplementary factors related to causes of morbidity classified elsewhere

FIGURE 18-9 Code range descriptions for external cause of illness or injury for ICD-10 2016 version from CMS.gov website.

Source: <https://www.cms.gov/Medicare/Coding/ICD10/2016-ICD-10-CM-and-GEMs.html>

- Family history if the patient may be at risk for like illness
- Personal history if the patient's habits or past illnesses or condition place him at risk

Diagnostic coding can be intimidating. Like learning anything new, take it a little bit at a time, and remember, practice does make perfect. Read all guidelines carefully. Don't be afraid to ask questions—particularly if you do not understand terminology—so that you are capable of choosing the most appropriate code. Coding takes concentration, an in-depth knowledge of anatomy, physiology, and medical terminology,

and, most importantly, an “inquiring mind” to get to the heart of the patient's diagnosis and make sure that the codes truly describe what is wrong with each patient.

PROCEDURE 18-1 Locating an ICD-10-CM Code

Procedure Goal: To analyze diagnoses and locate the correct ICD code

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Patient record, charge slip or superbill, and ICD-10-CM manual

Method:

1. Locate the patient's diagnosis on the superbill (encounter form) or elsewhere in the patient's chart. If it is on the superbill, verify documentation in the medical chart.
RATIONALE: *The medical record documentation must back up all diagnosis codes used for billing.*
2. Find the diagnosis in ICD-10's Alphabetic Index. Look for the condition first; then locate the indented subterms that make the condition more specific. Read all cross-references to check all the possibilities for a term, including its synonyms and any eponyms.
3. Locate the code from the Alphabetic Index in ICD-10's Tabular List.

RATIONALE: *All codes must be verified in the Tabular List to be sure the most accurate code is chosen.*

4. Read all information to find the code that corresponds to the patient's specific disease or condition. Study the list of codes and descriptions. Be sure to pick the most specific code available. Check for the symbol that shows that additional characters may be required.

RATIONALE: *The additional characters allow for specificity. If they are given, they must be used, or the insurance carrier will not accept the code for payment.*

5. Be sure that all necessary codes are chosen to completely describe each diagnosis. Check for instructions stating that an additional code is needed. If more than one code is needed, be sure instructions are followed and the codes are listed in the correct order.

RATIONALE: *In order to accurately code the patient's condition, all applicable codes must be chosen and recorded as instructed by the ICD manual.*

6. Carefully record the diagnosis code(s) on the insurance claim and proofread the numbers.

PROCEDURE 18-2 Locating a Health Status (Z) Code

Procedure Goal: To analyze the patient record (or encounter form) and decide whether a Z code is an appropriate diagnosis code

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Patient record, charge slip or superbill, and ICD-10-CM manual

Method:

1. Locate the patient's diagnosis. This information may be found on the superbill (encounter form) or elsewhere in the patient's chart. If it is on the superbill, verify documentation in the medical chart.

RATIONALE: *All information billed to the insurance carrier must be backed up by the patient medical record.*

2. If the reason for the patient encounter relates to a physical exam, immunization, well-child visit, or other visit where there is no diagnosis or condition of illness found, a Z code will be used to code the reason for the visit (diagnosis).

3. Find the diagnosis in ICD-10's Alphabetic Index. Look for the condition first and then locate any indented subterms that make the condition more specific. Read all cross-references.

RATIONALE: *Subterms assist in locating codes with the greatest specificity.*

4. Locate the code from the Alphabetic Index in the Z code area of ICD-10's Tabular List.
5. Read all descriptive information to find the code that corresponds to the patient's specific reason for today's visit. Be sure to pick the most specific code available. Check for the symbol that shows that any additional specificity characters are required.
RATIONALE: *Fourth to 7th characters are required to record the most specific code available.*
6. Be sure that that no other codes are required to describe the patient's reason for the visit. Check for instructions

stating that an additional code is needed. If more than one code is needed, be sure instructions are followed and the codes are listed in the correct order.

RATIONALE: *The patient's condition must be coded so that all information about the diagnosis is included. If codes are listed in the wrong order, the insurance carrier may reject them.*

7. Carefully record the diagnosis code(s) on the insurance claim and proofread the numbers.

PROCEDURE 18-3 Locating an External Cause Code

Procedure Goal: To analyze the patient record (or encounter form) and decide whether an external cause code is required to completely code the encounter

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Patient record, charge slip or superbill, and ICD-10-CM manual

Method:

1. Locate the patient's diagnosis. This information may be found on the superbill (encounter form) or elsewhere in the patient's chart. If it is on the superbill, verify documentation in the medical chart.
RATIONALE: *All information billed to the insurance carrier must be backed up by the patient medical record.*
2. If the patient's diagnosis begs the question "How did that happen?" an external cause code is required to give the insurance carrier as much information as possible.
RATIONALE: *Without the external cause code, the payer does not know how the injury or illness occurred.*
3. After coding the diagnosis of the condition requiring treatment, open the ICD-10 manual to the External Cause Alphabetic Index or, if necessary, use the Table of Drugs and Chemicals. Find the appropriate description in

ICD-10's Alphabetic Index, looking for the condition first, and then locate any indented subterms that make the condition more specific. Read all cross-references.

RATIONALE: *Subterms assist in locating codes with the greatest specificity.*

4. Locate the code from the Alphabetic Index in the external cause code area of ICD-10's Tabular List.
5. Read all descriptive information to find the code that corresponds to how the patient's current condition came about. Choose the most specific code available. Check for the symbol that shows that any additional characters are required; many external cause codes require these.
RATIONALE: *Fourth to 7th characters are often required to record the most specific code available.*
6. Carefully record the diagnosis code(s) on the insurance claim and proofread the numbers.
7. External cause codes are always secondary, so be sure that the primary diagnosis code is listed first. Check for instructions stating an additional code is needed. If more than one code is needed, be sure instructions are followed and the codes are listed in the correct order.
RATIONALE: *The coding order is important. Insurers may deny claims if codes are not placed in the appropriate order.*

S U M M A R Y O F L E A R N I N G O U T C O M E S

LEARNING OUTCOMES	KEY POINTS
18.1 Recall the six ways that ICD codes are used today.	ICD codes are used to facilitate payment for medical services, evaluate utilization patterns (patient use of healthcare facilities), study healthcare costs, research quality of healthcare, predict healthcare trends, and plan for future healthcare needs.
18.2 Compare ICD-9-CM and ICD-10-CM.	ICD-10-CM is intended to provide a more precise clinical picture of the patient and enhanced trending analysis for data reporting. The number of codes increased from under 15,000 in ICD-9 to 68,000+ in ICD-10, and the characters changed from 3–5 numeric (with the exception of the E and V codes) to 3–7 alphanumeric. Both the 9th and 10th revisions contain the Alphabetic Index of the diseases, conditions, and related terms. The ICD-10 Tabular List consists of 21 chapters (versus ICD-9, with 17 chapters) with a corresponding range of codes. Many codes use an “X” as a placeholder for future expansion, which was not possible with ICD-9.
18.3 Describe the conventions used in ICD-10.	The conventions used in ICD include NOS; NEC; brackets; parentheses; colon; includes and Excludes (1 and 2) notes; instructions to use additional code, code first underlying disease, and code, if applicable, any causal condition first. Additionally, bold and italics are used in both the Alphabetic Index and Tabular List. Instructions to See condition and See also are found exclusively in the Alphabetic Index.
18.4 Outline the steps to code a diagnosis using ICD-10-CM.	To choose an ICD code, check the encounter form (superbill) and/or patient medical record for all applicable diagnoses. Find the key term in the Alphabetic Index and then search for any applicable subterms. Once the code has been located, verify its description in the Tabular List, again reading all applicable notations for other coding options and instructions. Document each code carefully using instructions for code sequencing on the CMS-1500 claim form.
18.5 Explain the purpose and usage of external cause of injury and health status codes.	Z codes are defined as Supplementary Classification of Factors Influencing Health Status and Contact with Health Services. They are used for patients who, although not ill, are seeking healthcare. They are used for exams, counseling, donors, chemotherapy encounters, and so on. The Supplementary Classification of External Causes of Injury and Poisoning are used to explain how an illness or injury came about. They are used for all types of accidents and poisonings, as well as to describe the external cause for morbidity.
18.6 Illustrate unique coding applications for neoplasms, diabetes mellitus, fractures, signs and symptoms, poisonings, and Z codes.	The majority of ICD-10-CM codes follow the general guidelines. However, unique coding applications do exist and chapter guidelines must be followed. These include but are not limited to the chapters on neoplasms, diabetes mellitus, fractures, signs and symptoms, poisonings, and the new Z codes.

CASE STUDY CRITICAL THINKING

© Red Chopsticks/Getty Images RF

Recall Cindy Chen from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding her case.

1. How would you code Cindy's HIV-positive status using ICD-10?
2. What other diagnosis codes would you use related to Cindy's symptoms, using the ICD-10 coding system?
3. You note in Cindy's record that she has a history of mild depression. Should this diagnosis be coded and, if so, how would this diagnosis be coded?

EXAM PREPARATION QUESTIONS

1. (LO 18.1) Which organization maintains and updates the ICD system?
 - a. AMA
 - b. AAMA
 - c. WHO
 - d. TJC
 - e. BWW
2. (LO 18.3) The Alphabetic Index for ICD-10-CM is organized by
 - a. The part of the body involved
 - b. Symptoms the patient displays
 - c. Codes found in the Tabular List
 - d. The condition
 - e. The alphabet
3. (LO 18.3) _____ provide coding guidelines for using the ICD code set.
 - a. Abbreviations
 - b. Certain forms of punctuation
 - c. Chapter openers
 - d. Notes
 - e. Conventions
4. (LO 18.2) Matching a procedure with the diagnosis describing why the procedure was done is known as
 - a. Reasonable doubt
 - b. Medical necessity
 - c. Proof of need
 - d. Rationale
 - e. A requirement
5. (LO 18.4) Which diagnosis gives the primary reason for a patient's outpatient visit?
 - a. Primary diagnosis
 - b. Principal diagnosis
 - c. Secondary diagnosis
 - d. Probable diagnosis
 - e. Z code diagnosis
6. (LO 18.5) Which diagnosis code type can never "stand alone"?
 - a. A principal diagnosis
 - b. A Z code
 - c. An external cause code
 - d. A primary diagnosis
 - e. A supplemental diagnosis
7. (LO 18.5) What is the purpose of external cause codes?
 - a. To act as the primary diagnosis
 - b. To describe well-child visits
 - c. To describe poisonings
 - d. To describe how an accident occurred
 - e. To describe poisonings, accidents, and other causes of injury and morbidity
8. (LO 18.1) The primary reason for the ICD-10 update is
 - a. There are more diagnoses to choose from
 - b. It works better with EHR programs
 - c. It provides greater specificity for diagnosis classifications
 - d. It provides room for expansion for new codes
 - e. It provides greater specificity and room for code expansion
9. (LO 18.3) Which coding convention is *not* new in ICD-10?
 - a. Includes 1 & 2
 - b. Excludes 1 & 2
 - c. Default code
 - d. See/See also
 - e. Placeholders
10. (LO 18.6) Which ICD-10 chapter replaces the V codes found in previous versions of ICD?
 - a. Chapter 21
 - b. Chapter 20
 - c. Chapter 10
 - d. Chapter 5
 - e. Chapter 1

Go to CONNECT to see EHR activities on *Using ICD-10 Diagnostic Codes and Maintaining the ICD-10 Database*.

Recall Cindy Chen from the case study at the beginning of the chapter.

1. You receive a call from Cindy, who is quite upset. She has just received an EOB from her insurance company clearly stating a diagnosis of AIDS. Although HIV positive, she has not been diagnosed with AIDS. How will you help Cindy's immediate concern of her diagnosis?
2. In looking at Cindy's insurance claim, you see that the new coder did indeed use the diagnosis code for AIDS

instead of HIV. How can this be corrected with the insurance company? What will you say to the coder regarding the need for accuracy when coding any claim?

Procedural Coding

CASE STUDY

PATIENT INFORMATION	Patient Name	DOB	Allergies
	Raja Lautu	8/3/19XX	Benzalkonium Chloride, Sulfa
PATIENT INFORMATION	Attending	MRN	Other Information
	Elizabeth H. Williams, MD	224-86-564	Family hx of breast CA. Nonsmoker. Occ. wine w/ meals.

Raja Lautu is a 42-year-old woman who had a (screening) digital mammogram with CAD (computer-aided detection) performed recently as part of her physical examination (she is a new patient for Dr. Williams and BWW Medical Associates). When the mammogram revealed a small density in the

© ERproductions Ltd/Blend Images LLC RF

right breast, a complete ultrasound of this breast was ordered with stereotactic breast biopsy. Considering Raja's family history reveals that both her mother and maternal aunt have had breast cancer, she is understandably nervous about this development.

Keep Raja in mind as you study this chapter. There will be questions at the end of the chapter

based on the case study. The information in the chapter will help you answer these questions.

ACTIVSim

LEARNING OUTCOMES

After completing Chapter 19, you will be able to:

- 19.1** List the sections of the CPT manual, giving the code range for each.
- 19.2** Describe briefly each of the CPT's general guidelines.
- 19.3** List the types of E/M codes within the CPT.
- 19.4** List the areas included in the surgical coding section.
- 19.5** Locate a CPT code using the CPT manual.
- 19.6** Explain how to locate a HCPCS code using the HCPCS coding manual.
- 19.7** Explain the importance of code linkage in avoiding coding fraud.

KEY TERMS

- add-on code
- global period
- bundled codes
- HCPCS Level II codes
- concurrent care
- Healthcare Common Procedure Coding System (HCPCS)
- consultation
- modifier
- counseling
- new patient
- critical care
- panel
- Current Procedural Terminology (CPT)*
- procedure code
- downcoding
- unbundling
- E/M code
- upcoding
- established patient

- IX.C.1** Describe how to use the most current procedural coding system
- IX.C.3** Describe how to use the most current HCPCS level II coding system
- IX.C.4** Discuss the effects of:
 - (a) upcoding
 - (b) downcoding
- IX.C.5** Define medical necessity as it applies to procedural and diagnostic coding
- IX.P.1** Perform procedural coding
- IX.P.3** Utilize medical necessity guidelines
- IX.A.1** Utilize tactful communication skills with medical providers to ensure accurate code selection

3. Medical Terminology

- d. Define and use medical abbreviations when appropriate and acceptable

8. Administrative Procedures

- c. Process insurance claims
- (3) Perform diagnostic and procedural coding

► Introduction

In the previous chapter, you were introduced to diagnostic coding—the reason(s) the patient sought healthcare. In this chapter, you will explore the language of procedural coding. You will learn how to translate the medical terms for the procedures and services provided to patients into code numbers selected from standardized procedural coding systems. These codes, when placed correctly on the healthcare claims introduced in the *Insurance and Billing* chapter, explain to third-party payers the services patients received from the provider.

After you study the concepts of procedure or CPT codes, you will explore the “linking” of diagnosis codes with procedure codes to explain the *medical necessity* of each procedure or service performed. Finding the correct codes can require detective work! The reward is accurate procedure codes that, when combined with accurate and appropriate diagnosis codes, bring the maximum appropriate reimbursement to the practitioners in your medical office.

► The CPT Manual

LO 19.1

After an office or clinic visit, hospital or nursing home visit, inpatient or outpatient consultation, or even a house call, each procedure and service performed on or for a patient is reported on healthcare claims using a **procedure code**. These codes represent medical procedures, such as surgery and diagnostic tests, as well as medical services, such as physical examinations to evaluate a patient’s condition. Medical assistants often choose these procedure codes—based on the information provided by the practitioner on the encounter form, or from the patient medical chart or electronic health record—and use them to report medical services.

Current Procedural Terminology (CPT)

The most commonly used system of procedure codes is found in the *Current Procedural Terminology* or simply

CPT, a reference manual published by the American Medical Association (AMA). CPT is the HIPAA-required code set that translates descriptions for physicians’ and other providers’ healthcare-related procedures into 5-digit codes.

Like ICD, the CPT manual is updated yearly; new codes are used for services provided beginning January 1 of each new year. In each edition, newly developed procedures are added and old ones are revised or, if obsolete, deleted. These changes are also available in an electronic file for computerized medical offices. As with ICD codes, remember that the choice of which set of codes to use is based on the date of service, not the date of the claim. If claims are submitted January 2, 2017, and the date of service was December 23, 2016, CPT codes from 2016 would be used; for services provided on January 2, 2017, the 2017 edition of the CPT codes would be used.

Medical offices should always have the current year’s CPT available for reference and keep forms up to date. Like ICD codes, if current codes are not used, medical claims are often denied. Previous editions of each coding manual should be kept for at least several months after the new edition is released for use with claims for dates of service in the prior year, and for reference in case questions arise regarding previously submitted claims.

Organization of the CPT Manual

CPT codes are organized into six main sections:

Section	Range of Codes
Evaluation and Management	99201–99499
Anesthesiology	00100–01999
	99100–99140
Surgery	10021–69990
Radiology	70010–79999
Pathology and Laboratory	80047–89398
Medicine (except for anesthesia)	90281–99199
	99500–99607

FIGURE 19-1 CPT manual page showing edition, section, subsection, subheading, and category names as well as the code range on the page. Use of the CPT Manual page, found within the 2015 CPT Professional Edition. © American Medical Association [2014]. All rights reserved.

In looking at the section numbers, you will note that except for the Evaluation and Management section, the sections are listed in numeric order by code range. Because Evaluation and Management (E/M) codes are used so frequently, they are placed in the front of the manual for easy reference.

The Introduction to the CPT manual gives the user important general instructions for the use of CPT. In this section, you will also find helpful information regarding common prefixes, suffixes, and word roots found within the manual. CPT is also full of helpful illustrations of the human body.

A descriptive list of illustrations with the page number where each can be found is also in the Introduction. In addition, pay close attention to the guidelines found at the beginning of each section, as these provide important overall information for coding in each section. The CPT sections are divided into categories, which, in turn, are further divided into headings according to the type of test, service, or body system. Code number ranges included on a particular page are found in the upper-right corner so that a code can be located quickly after using the index (see Figure 19-1).

Note that each page also gives you other important information, including

1. Section name. The section is the name used by CPT to denote each chapter. In Figure 19-1, the section name is Surgery.
2. Subsection name. The subsection is the area within the section detailing the body system you are in. In Figure 19-1, the first subsection is General. Note that the next subsection for Surgery—Integumentary System—starts part of the way down the page.
3. Subheading. The subheading describes the body area for the body system you are looking at. Figure 19-2 shows the subheading of Skin, Subcutaneous, and Accessory Structures.
4. Category. The category describes the procedure area. In Figure 19-2, you will find the Incision and Drainage (I&D) category.

► General CPT Guidelines LO 19.2

As stated earlier, each CPT section contains guidelines for that section. Now, let's discuss the general guidelines, found at the beginning of the manual and followed throughout.

CPT Code Format

CPT codes are 5-digit numeric codes. Most codes are stand-alone codes with the complete description listed next to the appropriate code. The exception to this rule is the code description containing a semicolon, which is then followed by a code with an indented description. An indented description

means that you refer back to the previous code description, reading the information prior to the semicolon and adding the indented code information after the colon to complete the description. Let's look at the following example:

Example:

25500	Closed treatment of radial shaft fracture; without manipulation
25505	with manipulation

To read the full description for code 25505, read code 25500 up to the semicolon and then substitute the description for 25505 after the semicolon. Following these instructions, the full description for 25505 is *Closed treatment of radial shaft fracture; with manipulation*.

Add-on Codes

A plus sign (+) is used for **add-on codes**. These codes are used to describe procedures done in addition to a "main" procedure. For example, in Figure 19-3, you will note that code 11001 has a plus sign in front of it with a description of *each additional 10% of body surface, or part thereof (List separately in addition to code for primary procedure)*.

CPT code 11001 is also an indented code, meaning it is related to the code immediately preceding it (code 11000). The description for code 11000 is *Debridement of extensive eczematous or infected skin; up to 10% of body surface*. In putting the two codes together, you would be telling the insurance carrier that up to 20% of the body surface was debrided.

Surgery / Integumentary System

Coding Tip

Use of Depth and Surface Area For Reporting

Debridement of Wounds

When performing debridement of a single wound, report depth using the deepest level of tissue removed. In multiple wounds, sum the surface area of those wounds that are at the same depth, but do not combine sums from different depths.

CPT Coding Guidelines, Debridement

11000

Debridement of extensive eczematous or infected skin; up to 10% of body surface

➔ CPT Assistant May 99:10

(For abdominal wall or genitalia debridement for necrotizing soft tissue infection, see 11004-11006)

+ 11001

each additional 10% of the body surface, or part thereof (List separately in addition to code for primary procedure)

➔ CPT Assistant May 99:10 *CPT Changes: An Insider's View* 2009

(Use 11001 in conjunction with 11000)

FIGURE 19-3 Add-on code 11001 for use exclusively with primary code 11000.

Use of Add-on code 11001 for use exclusively with primary code 11000, found within the 2015 CPT Professional Edition. © American Medical Association [2014]. All rights reserved.

Example #1 shows you the correct coding when 20% of the body surface area is debrided; Example #2, when 25% (up to 30%) of the body is debrided.

Example #1: Debridement of 20% of body surface area

Code 11000	(debridement of first 10% of body surface)
And	
Code 11001	(debridement of second 10% of body surface area or part thereof)

Example #2: Debridement of 25% of body surface area

Code 11000	(debridement of first 10% of body surface)
And	
Code 11001	(debridement of second 10% of body surface area)
And	
Code 11001	(debridement for the next 5% as the description states "next 10% or part thereof")

Appendix D in the CPT manual contains a complete listing of all add-on codes in the manual. Add-on codes are never reported alone. They always follow the primary code.

As stated previously, also be alert for indented codes. For these codes, you will read the description of the “parent code” up to the semicolon and then replace the information following the semicolon with the information found in the indented code description. In Figure 19-1, codes 10022, 10061, 10081, and 10121 are all examples of indented codes.

Symbols Used in CPT

The CPT manual uses instructional symbols to give repetitive information without adding multiple pages. Refer to Table 19-1 for examples of each symbol.

- *Blue triangle.* This symbol tells the user that the code description has been revised in some way from last year. Note in Table 19-1 that code 33240 has a blue triangle next to it; this indicates that the code description has changed from the 2014 CPT manual’s description. This information could be important, as the change could mean the procedure performed by the physician may now require a different code. It could also mean something as simple as the placement of a comma or semicolon has changed.
- *Red dot.* The symbol denotes a new code for this edition of the CPT. In Table 19-1, note that code 77086 is a new procedure code as of 2015 CPT.
- *The # sign.* The # (pound) sign is used to denote codes that are out of numeric sequence. Referring to Table 19-1, (indented) code 27337 “works with” code 27327. It is followed by code 27328—causing it to be out of numeric order.

Example:

#27327	Excision, tumor, soft tissue of thigh or knee area, subcutaneous; less than 3 cm
#27337	3 cm or greater
#27328	Excision, tumor, soft tissue of thigh or knee area, subfascial (eg, intramuscular); less than 5 cm

TABLE 19-1 Common CPT Symbols, Descriptions, and Examples

Symbol	Meaning	Example
	Code description has changed since last revision	33240 Insertion of implantable defibrillator pulse generator only; with existing single lead
	New code since last revision	77086 Vertebral fracture assessment via dual-energy X-ray absorptiometry (DXA)
	Codes are out of numeric sequence	27337 3 cm or greater 27328 Excision, soft tissue of thigh or knee area, subfascial (e.g., intramuscular); less than 5 cm
	Text between triangles is new or revised	33218 Repair of single transvenous electrode, permanent pacemaker or implantable defibrillator ► For repair of single permanent pacemaker or implantable defibrillator electrode with replacement of pulse generator, see 33227, 33228, 33229 or 33262, 33263, 33264 and 33218 ◀
	Multiple procedures performed or add-on code which does not require multiple procedure modifier of 51	20974 = Modifier 51 Exempt Electrical simulation to aid bone healing; noninvasive (nonoperative)
	FDA approval pending	90651 Human Papillomavirus vaccine types 6, 11, 16, 18, 31, 33, 45, 52, 58, nonavalent (HPV), 3 dose schedule for intramuscular use
	Moderate (conscious) sedation is included in the procedure	44388 Colonoscopy through stoma, diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure)

This was done so code numbers would not be “reshuffled” every year. If the pound sign were not used and codes were to remain in numeric order, for code 27327 to have an indented code, code 27328 would have to be used. Code 27328 had previously been assigned its description. To keep all codes in numeric order, all codes from 27328 with its new description and all other codes on this page would have to be assigned new descriptions. This is a lot of work and very confusing with constantly changing code descriptions on a yearly basis. Note that each code is also found in red, in its “proper numeric place” with directions telling the coder in what code range to locate the out-of-sequenced code.

- *Triangles pointing toward each other.* Triangles pointing toward each other with text between them denote new or revised text information. Traditionally, these arrows have been green. You will also see them used for the out-of-sequence coding information. See code 33218 in Table 19-1.

Example:

⊙ ▲ 33218 Repair of single transvenous electrode, permanent pacemaker or implantable defibrillator ➡ CPT Assistant Summer 94:10, 19, Oct 96:9, Nov 99:15-16, Jun 12:3; CPT Changes: An Insider's View 2000, 2012, 2015 ▶ (For repair of single permanent pacemaker or implantable defibrillator electrode with replacement of pulse generator, see 33227, 33228, 33229 or 33262, 33263, 33264 and 33218) ◀

- *Circle with diagonal line.* This symbol is noted in Table 19-1 as “Modifier 51 Exempt.” Modifier 51 is used when multiple procedures are performed in the same session. Modifier 51 exempt codes are those to which the multiple procedure modifier does not apply. Appendix E of the CPT manual lists the modifier 51 exempt codes. Note that modifier 51 is never appended to a designated add-on code.
- *Lightning bolt.* The lightning bolt is used to denote vaccines pending FDA approval. Appendix K in the CPT manual lists the vaccines affected by this symbol. When the vaccines are approved, these along with other current codes will be listed on the AMA site at <http://www.ama-assn.org/ama/pub/physician-resources/solutions-managing-your-practice/coding-billing-insurance/cpt/about-cpt.page?> and then in subsequent CPT editions.
- *Bull's-eye.* The bull's-eye symbol denotes moderate (conscious) sedation and means it is understood that conscious sedation is necessary for the procedure performed, so conscious sedation is included in the procedure; it cannot be billed separately. Many endoscopy procedures include this symbol.

Example:

⊙ ▲ 44388 Colonoscopy through stoma; diagnostic, including collection of specimen(s) by brushing or washing, when performed (separate procedure) ➡ CPT Assistant Nov 07:8, Dec 13:3; CPT Changes: An Insider's View 2015 ▶ (Do not report 44388 in conjunction with 44389-44408) ◀

Because this code includes sedation as part of the procedure, administered by the physician performing the procedure, there will be no separate charge for the anesthesia. The CPT manual's Appendix G lists all codes that include moderate (conscious) sedation.

Whenever you are coding, always watch carefully for these symbols. Their instructions are explicit and must be followed to ensure correct procedure coding.

Modifiers

One or more two-digit **modifiers** (up to four per procedure) may be assigned to the 5-digit main code. Modifiers are written in column 24D on the CMS-1500 Claim Form (see Figure 17-9). The use of a modifier shows that one or more special circumstances apply to the service or procedure the physician performed. For example, in the Surgery section, the modifier 62 indicates that two surgeons worked together, each performing part of a surgical procedure during an operation. Each surgeon will be paid part of the amount normally reimbursed for that procedure code. The CPT's Appendix A explains the proper use of each modifier. Some section guidelines also discuss the use of modifiers within the individual section's coding information. Table 19-2 gives a brief overview with examples of common CPT modifiers.

Category II Codes, Category III Codes, and Unlisted Procedure Codes

Category II codes are optional, supplemental tracking codes used to track healthcare performance measures, like programs and counseling to avoid tobacco use (Code 4000F or 4001F if medication is instituted to assist patient). Category III codes are “temporary” CPT codes for emerging technology, services, and procedures. An example of a category III code is 0051T Implantation of a total replacement heart system (artificial heart) with recipient cardiectomy. If available, these codes should be used instead of the *unlisted codes* found throughout the CPT manual. Category II and III codes are both found directly after the last of the Medicine codes in the CPT manual.

When no code is available to completely describe a procedure, a code for an unlisted procedure is selected. Unlisted procedure codes are used for new services or procedures that have not yet been assigned codes in CPT. When these codes are used, which is rare, a procedure or service description (usually from the medical record) is sent with the claim submission. Some payers, including Medicare and Medicaid, prefer the use of HCPCS codes (when available) instead of the unlisted procedure codes used with CPT. Check with individual payers to learn each payer's preferences. HCPCS codes will be discussed in further detail later in the chapter.

Coding Terminology

Before you begin coding, you must have a basic understanding of common terminology used throughout the CPT manual. Some of these terms are defined in the following paragraphs.

TABLE 19-2 Common CPT Modifiers

Modifier	Description	Example
22	Increased Procedural Services. When the work required to complete the service is much more than usually required, modifier 22 may be added to the CPT code. Medical record documentation will be required. This modifier cannot be attached to an E/M code.	Because of extreme scarring and previous surgeries, lysis of adhesions (CPT 58740) requires almost twice the normal time frame. Code 58740-22.
23	Unusual Anesthesia. Once in a while, a procedure that normally does not require anesthesia or anesthetic will require general anesthesia because of unusual situations.	Excision of subcutaneous tumor of neck, because of patient age of 4, requires general anesthesia. Code 11424-23.
24	Unrelated E/M Service by the Same Physician During a Post-operative Period. The patient may require the services of the physician for treatment of an unrelated condition during a global surgical period.	The patient is one week post-op laparoscopic cholecystectomy. During post-op check, patient states asthma appears to be in exacerbation. Code 99024 for post-op visit. Code 99213-24 for E/M visit for asthma.
25	Significant, Separately Identifiable E/M Service by the Same Physician on the Same Day of the Procedure or Other Service. While in the office for a specific procedure, the patient may require an E/M service above and beyond that normally provided during the usual pre- and/or post-procedure period.	Patient comes in for a previously scheduled mole removal (11401). Prior to the procedure, the physician notes that the patient's BP is elevated. When the procedure is completed, BP is still noted to be elevated. Physician makes an adjustment to the patient's antihypertensive medication and counsels diet adjustments. Code 11401. Code 99212-25.
26	Professional Component. Some procedures (such as radiology) contain a combination of professional and technical components. If the physician provides only the professional component, modifier 26 is added.	Screening mammography, bilateral (CPT 77057). Hospital performs the mammogram; physician provides interpretation. Code 77057-26.
TC	Technical Component. This is the HCPCS modifier that is the "reverse" of modifier 26. It designates the provision of the technical component only.	Screening mammography, bilateral (CPT 77057). Hospital performs the mammogram; physician provides interpretation. Hospital Code 77057-TC.
32	Mandated Services. Service (such as a consult) is required by the insurance carrier, government agency, or regulatory agency.	Insurance carrier requires a second opinion prior to an elective surgical procedure. Physician performs consult regarding need for surgery. Code 99242-32.
47	Anesthesia by Surgeon. Surgeon provides and administers anesthesia other than local anesthesia. Modifier is appended to the surgical procedure.	Procedure performed is shoulder manipulation under regional anesthesia by orthopedic surgeon. Code 23700-47.
50	Bilateral Procedure. Modifier is used if the procedure is not defined as bilateral but the procedure is performed on both sides of the body.	Procedure: Bilateral knee arthroscopy. Code 29870-50.
51	Multiple Procedures. When the same provider performs multiple procedures (other than E/M, PT, and Rehab or supply provision) in the same session, the first procedure is listed as usual, and subsequent procedures should include the addition of modifier 51.	Code 15877. Suction-assisted lipectomy; trunk. Code 15879-51. Suction-assisted lipectomy; lower extremity.
52	Reduced Services. Due to circumstances, service is reduced or eliminated by the physician.	Exploratory laparotomy for removal of malignant neoplasm, but cancer is widely metastasized so procedure is halted. Code 49000-52.
53	Discontinued Procedure. Similar to modifier 52, except in this case, the procedure is discontinued due to patient condition becoming endangered.	Patient is undergoing diagnostic colonoscopy when significant PVCs become evident and uncontrollable. Procedure is halted. Code 45330-53.
54	Surgical Care Only. Surgeon provides only the surgical care with other physician(s) providing pre- and post-op care.	Total abdominal hysterectomy with bilateral salpingo-oophorectomy (TAH-BSO) surgery only. Code 58150-54.

(continued)

TABLE 19-2 Common CPT Modifiers

Modifier	Description	Example
55	Postoperative Management Only. Physician provides postoperative care only.	Total abdominal hysterectomy with bilateral salpingo-oophorectomy (TAH-BSO) postoperative care only. Code 58150-55.
56	Preoperative Management Only. Physician provides preoperative care only.	Total abdominal hysterectomy with bilateral salpingo-oophorectomy (TAH-BSO) preoperative care only. Code 58150-56.
57	Decision for Surgery. During an E/M service, decision is made that surgery is required.	Patient in office for biopsy results. Decision is made that treatment option includes mastectomy. Code 99214-57.
58	Staged or Related Procedure or Service by the Same Physician During the Postoperative Period. Circumstances may include staged (planned) procedure, procedure being more extensive than originally thought, or therapy following original procedure.	Patient has breast biopsy, which has a post-op period. During this period, mastectomy is decided upon and performed. Code 19302-58.
59	Distinct Procedural Service. Used when the secondary procedure is identified as <i>different session, different procedure/surgery, different site or organ system. Separate incision/excision, separate lesion, separate injury or area of injury when injuries are extensive.</i> (Some Medicare codes have edits that state certain procedures cannot be performed together regardless of use of 59 modifier.)	Medical records indicate that colonoscopy with polyp removal using snare (45385) and colonoscopy with hot biopsy forceps (45384) were done in same session. Code 45385. Code 45384-59.
62	Two Surgeons. Modifier indicates that two surgeons performed a procedure that normally is performed by one surgeon, each performing distinct aspects of the procedure.	Two surgeons work as a team for spinal cord exploration and decompression. Code 63075-62. Code 63077-62.
66	Surgical Team. As with modifier 62, this modifier is used when a team of surgeons is required for a complicated procedure.	Patient requires a heart-lung transplant. Team includes cardiac surgeon, thoracic surgeon, perfusionist, and anesthesiologist. Code 33935-66.
76	Repeat Procedure or Service by Same Physician. Procedure is performed and complication requires repeat or related service. Used to explain this is not a duplicate service but is medically necessary.	Patient undergoes arteriovenous anastomosis (36821), but anastomosis does not hold and requires repeat procedure. Code 36821-76.
77	Repeat Procedure by Another Physician. As with modifier 76, a second procedure is required, but in this case, a different physician provides the service.	Patient undergoes arteriovenous anastomosis (36821), but anastomosis does not hold and requires repeat procedure; performing physician is not available. Code 36821-77.
78	Unplanned Return to the OR by the Same Physician Following Initial Procedure for Related Procedure During the Postoperative Period. Complications related to the initial procedure are most often the reason for the return to surgery.	Patient undergoes implantation of central venous access device (36558), which clots off later in the day, requiring declotting. Code 36593-78.
79	Unrelated Procedure or Service by the Same Physician During the Postoperative Period. Usually, patient undergoes a primary procedure and, for an unrelated issue, requires a second surgery or procedure during the post-op period.	Patient undergoes laparoscopic cholecystectomy (47562). Two weeks later, experiences acute appendicitis episode and undergoes emergency appendectomy. Code 44970-79.
80	Assistant Surgeon. Surgeon acts as assistant to primary surgeon. (A physician assistant may function in this role.)	Surgeon performs total knee replacement with assistant surgeon. Code 27447-80.
81	Minimum Assistant Surgeon. This modifier is used only when minimal assistance during surgery is required.	Patient undergoing 4-vessel CABG. Second physician asked to assist only in stabilizing patient during procedure. Code 33536-81. Code 33518-81.

(continued)

TABLE 19-2 Common CPT Modifiers

Modifier	Description	Example
82	Assistant Surgeon (When Qualified Resident Surgeon Is Not Available). This modifier is used only in teaching hospitals where resident surgeons are normally available.	Patient undergoing 4-vessel CABG. Second physician asked to assist only in stabilizing patient during procedure because the surgical resident is assisting with another procedure. Code 33536-82. Code 33518-82.
90	Reference (Outside) Laboratory. Modifier is used when physician is billing for services provided by an outside laboratory. (Not allowed by Medicare.)	Provider office bills for comprehensive metabolic panel performed by “Allied Labs” and then reimburses the lab. Code 80053-90.
91	Repeat Clinical Diagnostic Laboratory Test. This modifier is used when serial (multiple) labs are required on the same day to monitor the patient’s condition.	After surgery, the patient appears to be in acute renal failure, requiring monitoring of kidney function. Code xxxxx-91.
92	Alternative Laboratory Platform Testing. Modifier 92 is used for disposable kit testing such as HIV testing.	Patient is tested for HIV using disposable test at hospital bedside. Code 86701-92.
99	Multiple Modifiers. Used when more than three modifiers are applicable to CPT code being used and the payer only accepts one modifier per code.	Medical Insurance Inc. accepts only one modifier per line, requiring modifier 99 be used and applicable modifiers be listed in block 19 of the CMS form. Procedure performed: Bilateral (50) mastectomy with assistant surgeon (80). Code 19307-99.

Note: You can see the complete listing of all modifiers in the *Current Procedural Terminology* manual, Appendix A.

Source: American Medical Association, *Current Procedural Terminology*, 2015 Professional Edition, copyright 2015.

Bundled codes consist of any code that includes more than one procedure in its description. Read code descriptions carefully, as it is unethical (and often considered fraudulent) to intentionally unbundle procedures into component codes when a bundled procedure code is available. For instance, all therapeutic procedures include diagnostic codes unless noted otherwise, so if a diagnostic knee arthroscopy (29870) is turned into a therapeutic arthroscopy (29871), only the therapeutic arthroscopy will be reported because it is understood that a diagnostic procedure must have taken place in order for the therapy to have taken place.

Concurrent care is described as similar care being provided by more than one physician. This frequently occurs when a patient is hospitalized and multiple specialists are caring for the patient. The services provided may be similar, but because of the differing specialties, the care is not considered to be duplication of services.

Critical care is provided to unstable, critically ill patients. Constant bedside attention is needed in order to code critical care, so the physician’s documentation must be explicit regarding the time spent with the patient. The time need not be continuous, but the time is added together so that critical care codes chosen are based on the sum total of the critical care given during one particular date. Unlike emergency care codes, which can only be used when the patient’s care is provided in an emergency department, the patient need not be in a critical care or intensive care bed in order for the codes to be used, but his condition must be critical in nature.

Consultations are patient visits or appointments provided at the request of other healthcare providers. The CPT codes for consultations include 99241–99245 for outpatient consultations and 99251–99255 for inpatient consultations. A service can only be considered a consultation if the 3Rs are present: *request* (from another practitioner), *record* (documentation) findings and recommendations, and *report* to the referring practitioner. If the consulting provider takes over the care of the patient, then he is no longer considered a consulting provider, but a treating provider. In this case, he will use standard “visit” E/M codes and no longer use consultation codes. As of January 2010, Medicare stopped accepting consultation codes; comparable inpatient and outpatient E/M service codes (such as 99201–99205 and 99211–99215 for outpatient visits) are to be used instead. Many commercial payers, following Medicare’s lead, also have begun denying consultation codes, so again, it is important to know each payer’s rules and regulations before submitting claims to the payers. We will discuss E/M codes and services in greater detail in just a bit.

Counseling is considered part of E/M (Evaluation and Management) services, but if a complete history and physical exam does not take place (making an E/M code inappropriate), counseling codes may be used. These codes may be used when discussing with the patient and family questions or concerns regarding one or more of the following: diagnostic results and recommendations; prognosis, risks, and benefits of options; instructions for treatment and/or follow-up; importance of compliance; risk factor reduction; and patient/family education.

Downcoding is the term used when the insurance carrier bases reimbursement on a code level lower than the one submitted by the provider. This can occur for several reasons:

- The coding system used by the insurer does not match that used by the provider. This can occur if the provider uses a HCPCS code the insurer does not recognize. Always verify the code set accepted by the payer.
- If a workers' compensation carrier bases payment on an RVS (relative value system), the carrier may convert a CPT code to the lowest-paying code within the system. Again, check with the payer as to the system in use.
- A payer requests backup documentation (medical records) on a case and finds the documentation does not "back up" the level of code used on the claim. This is by far the most common cause of downcoding in medical offices. Be sure your provider's documentation always is specific enough to back up the level of code used.

Unbundling, as stated in the bundling definition, is defined as breaking a bundled code into its component parts for higher reimbursement and is not allowed. Code 77055 is defined as mammography, unilateral. Without research, you might think a bilateral mammography would be coded by adding modifier 50, but this is not the case. Code 77056 is an indented code with the description of mammography, bilateral—this code without a modifier is used for bilateral mammography.

Upcoding refers to coding a procedure or service at a higher level than that provided to receive a higher level of reimbursement. Other terms for this process are *code creep*, *overcoding*, and *overbilling*, and all are fraudulent practices when done knowingly or repeatedly.

It is important to remember that insurers, particularly federally funded ones like Medicare and Medicaid, assume that if they are being billed, those doing the billing are appropriately trained to bill services following all appropriate guidelines. Ignorance is not considered an excuse when these payers are repeatedly billed excessive amounts for procedures. So it is imperative that each provider's documentation in the patient medical record is clear and concise and proves the level of service being billed actually occurred.

► Evaluation and Management Services

LO 19.3

To diagnose conditions and plan treatments, physicians use a wide range of time, effort, and skill for different patients and circumstances. Evaluation and management codes (**E/M codes**) are often considered the most important of all CPT codes because all physicians in any medical specialty can use them. Table 19-3 gives the E/M breakdown by type with code range.

Many E/M codes are divided based on the patient status of **new patient** versus **established patient**. This is simply because, in many cases, a practitioner will need to spend more time with a new patient, getting to know her and her history, than will be necessary with a patient who has been coming to the practice for several years and whose history is well known.

The general rule of thumb is if a patient has been seen by a practitioner of the same specialty in the same practice within 3 years, he is an existing patient. If the patient has not been seen in the practice within the last 3 years, he is considered a new patient. Figure 19-4 shows an example of a new versus established patient decision tree.

In addition to being the most important codes in the CPT manual, the E/M codes are considered by many the most difficult to code because of the many factors that must be considered when choosing an E/M Code. Let's examine the various components that must be considered when choosing an E/M code. As with any coding exercise, practice is the most important factor when learning procedure (or diagnostic) coding.

TABLE 19-3 E/M Code Breakdown with Code Ranges

E/M Type	Code Range
Office/Other Outpatient Services	New Pt 99201–99205 Est. Pt 99211–99215
Hospital Observation Services	99217–99226
Hospital Inpatient Services	99221–99239
Consultations	OutPt 99241–99245 InPt 99251–99255
Emergency Department Services	99281–99288
Critical Care Services	99291–99292
Nursing Facility Services	99304–99318
Domiciliary, Rest Home (Boarding Home), or Custodial Care Services	New Pt 99324–99328 Est. Pt 99334–99337
Domiciliary, Assisted Living Facility, or Home Care Plan Oversight Services	99339–99340
Home Services	New Pt 99341–99345 Est. Pt 99347–99350
Prolonged Services	99354–99360
Case Management Services	99363–99368
Care Plan Oversight Services	99374–99380
Preventative Medicine Services (includes counseling services)	New Pt 99381–99387 Est. Pt 99391–99397 Other 99420–99429
Non-Face-to-Face Physician Services	99441–99449
Special Evaluation and Management Services	99450–99456
Newborn Care Services	99460–99465
Inpatient Neonatal Intensive Care Services and Pediatric and Neonatal Critical Care Services	99466–99486
Care Management Services	99487–99490
Transitional Care Management Services	99495–99496
Advance Care Planning	99497–99498
Other Evaluation and Management Services	99499

FIGURE 19-4 Decision tree for new versus established patients.

Key Factors in Determining Level of Service

The E/M section guidelines explain how to code different levels of these services. Three key factors documented in the patient's medical record help determine the level of service:

1. The extent of the patient history taken
2. The extent of the examination conducted
3. The complexity of the medical decision making

Let's look briefly at each of these key factors.

Patient History The elements of a history include the chief complaint (CC); history of present illness (HPI); review of systems (ROS); and past, family, and/or social history (PFSH). When coding, the history is described using one of the following terms:

- **Problem-focused**—history is limited to the chief complaint and a brief history of the present problem.
- **Expanded problem-focused**—history includes the chief complaint, a brief history of the current problem, and a “problem-pertinent” review of systems.
- **Detailed**—history still focuses on the chief complaint but includes an extensive history of the current problem and an extended review of systems and pertinent past, family, and/or social history.
- **Comprehensive**—the most complex of the histories; all four components of CC, HPI, ROS, and PFSH are documented.

Physical Exam The elements of the physical exam include the same terminology but relate to the level of examination performed. The physical exam has three elements:

1. The constitutional exam includes any of the following: BP sitting or lying, pulse, respirations, temperature, height, weight, and general appearance.
2. Body areas (BA) include head (including face), neck, chest (including breasts and axillae), abdomen, genitalia, groin and buttocks, back, and each extremity.
3. Organ systems (OA) include the following systems: ophthalmologic (eyes), otolaryngologic (ears, nose, throat, and mouth), cardiovascular, respiratory, GI (gastrointestinal), GU (genitourinary), musculoskeletal, integumentary (skin), neurologic, psychiatric, and hematologic/lymphatic/immunologic (blood, lymph, immunity).

Physical exam terms include the following:

- **Problem-focused**—exam is limited to the body area or organ system directly related to the chief complaint. (1 BA or OS)
- **Expanded problem-focused**—limited exam of the affected body area or organ system and any other symptomatic or related BA or OS. (2–7 limited BA or OS)
- **Detailed**—includes an extended exam of the affected body area and any other related, symptomatic BA or OS. (2–7 extended BA or OS)
- **Comprehensive**—the most extensive exam; includes either a complete single-specialty exam or a complete multisystem examination. (8 + BA or OS)

Medical Decision Making The most important key component in establishing an E/M code is the medical decision making (MDM) and it is probably the most difficult to document. It is based on the complexity of the decision making by the provider about the patient's care and diagnosis. The three elements that must be documented to establish MDM are the number of diagnoses or management options (minimal, limited, multiple, or extensive); the amount or complexity of data to be reviewed (none or minimal, limited, moderate, or extensive); and the risk of complication or death if the condition is untreated (minimal, low, moderate, or high). Here we outline the complexity levels of medical decision making:

- **Straightforward MDM**—there are minimal diagnosis and management options with a minimal amount or complexity of data to be reviewed and minimal risk to the patient of complication or death if the condition is left untreated.
- **Low-complexity MDM**—there are a limited number of diagnoses and management options with a limited amount or complexity of data to be reviewed and low risk of complication or death if the patient is not treated.
- **Moderate-complexity MDM**—there are multiple diagnoses and management options with a moderate amount or complexity of data to review. If not treated, the condition presents a moderate risk of complication or death to the patient.

- High-complexity MDM—the physician has extensive diagnosis and management options with an extensive amount and complexity of data for review. The patient is at high risk for complication and/or death if not treated.

Some medical assistants and billers/coders like to use a grid similar to the one in Table 19-4 to assist with the MDM decision-making process when assigning E/M codes.

Three Contributory Factors in Assigning Codes

In addition to these three key components, some E/M codes take three *contributory factors*, listed as follows, into consideration when codes are assigned:

1. Counseling. This component is only considered critical for E/M codes when counseling is the reason for the encounter and constitutes 50% or more of the total time of the visit.
2. Coordination of care. This is the time the licensed practitioner uses to coordinate patient care with other healthcare agencies like home care or nursing home care.
3. Nature of the presenting problem. This is another term for the severity of the patient's chief complaint.
 - A minimal complaint may not require the presence of a physician, but service is provided under the licensed clinician's supervision such as a BP reading or dressing change.
 - A self-limited complaint is a minor problem that will run a "known" course and is transient in nature. A problem with a good prognosis when the patient is compliant also may be considered self-limiting.
 - Low-severity complaints are those with a low risk of morbidity and mortality (death) if there is no treatment. Full recovery is expected.
 - Moderate-severity complaints have a moderate risk of morbidity and mortality if there is no treatment. Prognosis is uncertain and there is increased risk of impairment.
 - High-severity complaints are those of high to extreme risk. Risk of death is moderate to high and there is a high risk of prolonged functional impairment.

Finally, *time* is listed as a component to some codes after being incorporated in 1992 to assist with code choice. The times listed are considered averages and unless the code choice, such as with face-to-face contact codes, is based on time, time should not be considered a critical factor when choosing an E/M code. As noted in Table 19-3, the location of the service is also important because different E/M codes

apply to services performed in a provider's office or other outpatient location, a hospital inpatient room, a hospital emergency department, a nursing facility, an extended-care facility, or a patient's home.

Appendix C of the CPT code manual lists medical record documentation examples of each E/M code type to assist you in choosing appropriate E/M codes for your provider.

Surgical Coding

LO 19.4

Figure 19-5 illustrates an encounter form listing codes from the integumentary part of the surgical section. Many insurance carriers cover the surgical procedures found in CPT as part of a *surgical package*. Included in most surgical packages are the preoperative exam and testing; the surgical procedure itself, including local or regional anesthesia if used; and routine follow-up care for a set period of time. Payers assign a fee to each of these packaged codes that pays for all the services provided in this package. If using anesthesia other than local anesthesia, the anesthesiologist billing for her services would use an anesthesia code.

The period of time covered for follow-up care is called the **global period**. For example, the global period for repairing a tendon might be set at 15 days. A global period for major surgery like an abdominal hysterectomy might be set at 90 days. During the global period, any care provided related to the surgical procedure is included in the surgical fee and cannot be billed separately; remember, any attempt to do so is called *unbundling* and is considered fraud. As discussed earlier, if a patient is seen for an unrelated problem, the service or procedure may be billed separately using modifier 24 for E/M services, or modifier 79 for an unrelated surgical procedure taking place in a global period. After the global period ends, additional services related to the initial surgery can be reported separately for payment.

As shown in Figure 19-5, to make the coding process more efficient, most medical offices list frequently used procedures and their applicable CPT codes on superbills, or encounter forms. After seeing the patient, the provider checks off the appropriate procedures or services and the patient returns the form to the medical assistant at the front desk. The medical assistant then inputs the information into the facility computer system, if the office is computerized. If the office uses a manual system, the administrative medical assistant will put the office copy of the completed superbill in a designated area so it can be used to quickly and efficiently complete the CMS-1500 form for submission to the patient's insurance carrier. If superbills are used in the office, the office must remember to update both the ICD and CPT codes on the superbills and in any computer programs when the new codes are available

TABLE 19-4 Medical Decision-Making Elements for E/M Codes

each year (October for ICD codes and January for CPT codes). See Figure 19-6 for an example of an electronic billing report for BWW Medical Associates's EHR. This report will let you know which records have been coded with both diagnostic and procedural coding systems and are ready for billing to each patient's insurance plan.

Let's look at each subsection of the surgery chapter of the CPT manual with a brief overview of coding guidelines for each area.

Integumentary System

Integumentary subheadings are skin, subcutaneous, and accessory structures; nails; pilonidal cyst; introduction; repair (closure); destruction; and breast. These are further subdivided by the procedures done within each subheading, such as I&D, excision, paring, and biopsy benign and malignant lesions. Many codes in this section are based on size and location; choose carefully. Carefully read instructions regarding closure of any removed or repaired lesion. Simple closure is often included in the main code, so often you will code closure only if they are intermediate (layered) or complex (greater than layered). The instructions within the integumentary section give great information as to how to choose the correct closure type. Read everything carefully and follow the instructions exactly.

Musculoskeletal System

The musculoskeletal subheadings begin with general and then start with the head and work their way down to the foot and toes. You will find this to be true for the rest of the CPT manual. Codes start from the top of the body and work their way down within each section and subsection. Casts and strappings as well as endoscopy and arthroscopy are also found in this chapter. Probably the most common codes from this section include the fracture codes. Here are a couple of straightforward rules:

- A fracture treatment is closed unless stated otherwise; that is, treatment occurs without opening the skin. Open treatment means that surgery occurred to repair the fracture. Percutaneous treatment (fixation) immobilizes the fracture with hardware (pins) inserted using X-ray guidance.
- Be careful with cast and strapping codes. Fracture repair assumes cast application and includes it. Cast application and removal for fractures are coded only when the physician applying or removing the cast did not initially treat the patient's fracture.
- Last, any therapeutic procedure (like arthroscopy) includes the diagnostic procedure, so if a diagnostic procedure becomes a therapeutic (surgical) procedure, in the end, only the therapeutic procedure will be coded.

Respiratory System

The most important item to remember when coding the respiratory system is to code to the furthest extent of the procedure. For instance, many endoscopy procedures for the respiratory system begin with the nose and proceed further into the respiratory system. If the procedure results in a laryngoscopy, the scope passes through the trachea, so the code includes scoping of the trachea, which is not coded separately, as the description for code 31515 states *with or without tracheoscopy, for aspiration*. Be sure to also read information regarding the approach for the procedure. Many procedures can be done via a scope (-scopy) or as an open procedure using an incision (-tomy); these procedures are very different, so be cautious when coding similar procedures using different approaches. Be alert also for *incision* codes versus *excision* codes (removal—*ectomy*) and for the suffix *-plasty*, signifying a repair procedure like rhinoplasty. Your anatomy and terminology knowledge will be invaluable when coding.

Cardiovascular System

As you might expect, cardiology coding consists of some of the more complicated coding scenarios. Often, in order to completely code cardiovascular surgery, codes from the

cardiovascular surgery section, medicine section (for nonsurgical services), and radiology section (for diagnostic or visualization assistance) will all be necessary. When coding bypass procedures, read instructions carefully. You must know not only whether veins or arteries (or both) are used in the bypass but also the correct coding sequence; the right codes in the wrong order will also hold up a claim. Injection codes will be used for diagnostic and therapeutic procedures and you will also find embolectomy and thrombectomy codes in this section. Nonsurgical cardiography procedures include ECGs, Holter monitors, and exercise tests. The echocardiography area includes all cardiac ultrasound procedures as well as vascular Doppler procedures for noncardiac vascular areas, such as the extremities. Read *everything* and make sure to code procedures completely, using as many codes as necessary.

Hemic/Lymphatic Systems and Mediastinum and Diaphragm

These two short subsections of the surgery section include procedures on the spleen, bone marrow, and lymph nodes as well as surgical procedures related to the mediastinum and diaphragm. Coding in these sections is pretty straightforward if you read carefully.

Digestive System

The most common procedures done in the upper digestive system are incisions and excisions followed by repairs. The lower digestive system (stomach, intestines, rectum) include these as well as endoscopies (and laparoscopies). As always, remember that therapeutic procedures include diagnostic procedures unless you are specifically instructed within the chapter that two codes may be used. You will also find procedures on the liver, pancreas, biliary tract, abdomen, and peritoneum in this chapter.

Urinary System

The most “intense” coding in the urinary system revolves around the kidneys and renal function and treatment, including services for renal transplantation. In addition to kidney procedures, you will find diagnostic (including urodynamics) and therapeutic procedures for the ureters, bladder, and urethra. Again, as with the respiratory and digestive system, many procedures may be done laparoscopically as well as through an open incision, so read notes and code descriptions carefully to be sure to choose the correct approach.

Male Genital System

Because of the many repair codes associated with it, the subheading Penis is the largest within the male genital section. Other procedure codes found throughout this chapter include excision, incision, biopsy, destruction (of lesions), including laser surgery (treatment for BPH and prostate cancer), and brachytherapy (radiotherapy). The two codes for intersex surgery (male to female and female to male) are also found in this section.

Female Genital System/ Maternity and Delivery

Medical assistants and coders use this section either extensively or almost never, as the codes found here are used almost exclusively by OB/GYN providers. This chapter is set up from “the outside in,” starting with the introitus (vaginal opening) moving to the ovaries within the pelvis, with a separate subsection devoted to labor and delivery. This chapter has definitions and specialized guidelines too numerous to cover here, so if you find yourself coding for the specialty of OB/GYN, read the entire chapter carefully, taking notes and highlighting important information. Seeking the assistance of an experienced OB/GYN coder will be very helpful when you start out.

Endocrine System

Another short section, the endocrine system codes include those for procedures on the thyroid, parathyroid, thymus, adrenal glands, pancreas, and carotid body. Procedures include incisions, excisions, and laparoscopies.

Nervous System

Codes describing procedures on the brain, spinal cord, and peripheral nerves are all found in this section. Anatomic sites create the subheadings, which are subdivided by the procedure performed. Because of the complicated nature of coding

procedures related to this delicate system, multiple specialized guidelines are found within this chapter. The approach again is an important consideration when coding surgery on the brain (anterior, middle, or posterior cranial fossa), as is the definitive procedure that describes the procedure done to the lesion and the reconstruction or repair necessary at the end of the surgery. Lumbar punctures, CSF (cerebrospinal fluid) shunt procedures for hydrocephalus treatment, and all treatments for spinal column and cord defects and peripheral nerve repair and destruction are found in this chapter.

Eye and Ocular Adnexa

This chapter covers everything from everyday eye exams and removal of a foreign body from the external eye to enucleation surgery to remove the contents of the eye socket. Many of the procedures found here are highly specialized and require careful reading of instructions and guidelines. The codes are divided by anterior and posterior segments, ocular adnexa, and conjunctiva (including the lacrimal system). Procedures include incisions, excisions, repairs, destruction, and reconstructions.

Auditory System

The auditory system section is divided into the external ear diagnostics and treatments, middle ear diagnostics and treatments, and then the inner ear diagnostics and treatments, followed by temporal bone procedures. An operating microscope is necessary for many procedures and code descriptions must be read carefully to avoid unbundling, as some procedures include this component but others allow a separate code for its use. Procedures include incisions (including “tubing,” or tympanostomy), excisions, introductions, and repairs (tympanoplasty).

Radiology

The radiology section includes diagnostic radiology (imaging), diagnostic ultrasound, radiologic guidance, mammography, bone and joint procedures, radiation oncology, and nuclear medicine.

Many diagnostic radiology procedures use modifiers 26 (professional component only) and TC (technical component only); however, read descriptions carefully. When a code states that it includes “radiologic supervision and interpretation,” as with code 77021, the code is all-inclusive and modifiers cannot be used. There are many instructions throughout this chapter leading you to correct code usage. Read all *includes* and *excludes* instructions carefully.

Laboratory Procedures

Organ or disease-oriented **panels** listed in the pathology and laboratory section of the CPT include tests frequently ordered together. An electrolyte panel, for example, includes tests for carbon dioxide, chloride, potassium, and sodium. Each element of the panel has its own procedure code. However, when the tests are performed together, the code for the panel must be used, rather than the separate procedure codes. To code a panel correctly, the provider must order each test listed within the panel and there must be a need for each of them. If a panel

is appropriate but one or two laboratory tests are also ordered that are not included in the panel, code the panel and then the additional tests separately.

If each test in a panel or procedure in a surgical package is coded separately, it will cause unbundling of the panel or package. The review performed by the insurance carrier's claims department will "rebundle" the services under the appropriate code, which could delay payment. Remember—when unbundling is done intentionally or repeatedly to receive more payment than is correct, you and the practice can be investigated for fraud.

Medicine and Immunizations

Injections and infusions of immune globulins, vaccines, toxoids, and other substances require two codes—one for giving the injection and one for the particular vaccine or toxoid that is given. An E/M code is not used along with the codes for immunization unless a significant evaluation and management service is also performed (like a yearly physical exam) and documented appropriately by the doctor. Modifier 59 would be appended to the E/M code in this case, indicating the need for both procedures.

► Using the CPT Manual

LO 19.5

Now that you have a basic understanding of the CPT manual's format, its conventions, and its sections, including where to find section guidelines and instructions, it is time to actually use the CPT manual. Remember, when choosing E/M codes you must know whether the patient is a new or established patient and where the services took place. Use all of the information you have studied, and the chapter guidelines, to assist you in locating the correct codes.

The next step is to find the procedures and services provided by the office. As with diagnosis codes, these may be found on the superbill. However, remember to check the patient's chart to verify that documentation of the procedures and services provided exists within the medical chart (if it is not written down, it did not happen). When coding E/M codes, you may find it easiest to go directly to the E/M section in the front of the CPT manual to choose the correct code. For all other procedures, you will need to use the alphabetic listing of procedures in the back of the CPT manual.

When using the alphabetic listing of procedures, the number or number range in the index to the right of the description represents the coding possibilities for the description. If a hyphen is between two codes, this indicates a code range and each code in the range will need to be checked in the numeric index to choose the correct code. Code numbers with commas between them indicate that there is more than one possible correct location for the code required. Again, all codes will have to be checked. In some cases, the patient's medical record may show an abbreviation, an *eponym* (a person or place for which a procedure is named), or a synonym. For example, the record might state "treated for bone infection." In the CPT's index, the entry for "Infection, Bone," is followed by the instruction "See Osteomyelitis." The greater your knowledge of anatomy, physiology, and terminology, the easier it will be for you to code. Let's look at a couple of examples.

Example #1: Procedure—Dressing Change

To find the code for "dressing change," first look alphabetically in the index for that procedure. Then find the procedure code in the body of the CPT to be sure the code accurately reflects the service performed. The procedure code 15852 explains the dressing change is for "other than burns" and "under anesthesia (other than local)." (A dressing change without anesthesia would be included in an E/M code.) Per the notes in CPT, a dressing for a burn is found in procedure codes 16010–16030.

Example #2: Procedure—Excision of Vaginal Cyst

To code the excision of a vaginal cyst, you would first look under "Excision" (the main term). There is a listing for the subterm "Cyst" beneath "Excision," followed by a list of organs, regions, or structures involved. Note that each subterm is indented under the main term. Additionally, the subterms relating to cyst locations are indented even further under that subterm. This is a common occurrence in the CPT manual. Look for "Vagina" to find the code (57135). Another way to find the code is to look under "Vagina" as the main term and then find the listing for "Cyst Excision" as a subterm beneath it.

Once you decide on the appropriate CPT code(s), the next step is to check for any applicable modifiers. The use of modifiers can greatly enhance your reimbursement and can cut down on claim inquiries from the insurance carrier, but the ability to use modifiers correctly and proficiently will require practice. As discussed earlier, Appendix A of the CPT manual contains all CPT modifiers, and many of the section guidelines also contain information regarding the use of modifiers within that section. This is not an optional step. Modifier use is required if one is available for the situation.

Example #3: Procedure—Bilateral Breast Reconstruction

A bilateral breast reconstruction requires the modifier -50. Find the code for "breast reconstruction with free flap": 19364. To show the insurance carrier that the procedure was performed on both breasts, attach the -50: 19364-50. (Some insurers will require that you list the code once and then a second time with the modifier: 19364, 19364-50.) The insurance company will often pay the full charge for the first procedure and then pay the second procedure at 50%.

Once all procedures and services have been assigned a CPT code and modifier as needed, carefully enter the 5-digit code(s) and modifiers in block 24D of the CMS-1500 form, as you learned in the *Insurance and Billing* chapter. Remember that the primary procedure—often this is the most labor-intensive one or the principal reason for the patient's encounter—is listed first and is matched with the appropriate diagnosis code, often the primary diagnosis, to demonstrate medical necessity for the insurance carrier. After the principal procedure is listed, enter all other procedures provided to the patient during this date of service and match each with its appropriate diagnosis to verify its medical necessity as well.

Procedure 19-1, found at the end of this chapter, outlines the correct steps for locating a CPT code.

► The HCPCS Coding Manual LO 19.6

The **Healthcare Common Procedure Coding System, commonly referred to as HCPCS** (pronounced hick-picks), was developed by the Centers for Medicare and Medicaid Services (CMS) for use in coding services for Medicare patients. Today, in addition to Medicare, Medicaid and private insurance programs also accept some HCPCS codes. To avoid claim denials due to an invalid or unacceptable code, be sure to check with the insurance carrier to see if they accept HCPCS codes and, if so, which ones. The HCPCS coding system has two levels:

1. HCPCS Level I codes are more commonly known as CPT codes.
2. **HCPCS Level II codes**, issued by CMS, are called national codes and cover many supplies, such as sterile trays, drugs, injections, and DME (durable medical equipment). If CPT and HCPCS have identical descriptions, the HCPCS Level I (CPT) code should be used. However, if CPT has a generic description and HCPCS has a more specific description, HCPCS Level II should be used. Level II codes also cover services and procedures not included in the CPT. For instance CPT has one (generic) code to cover the supplies and materials used for in-office procedures (99070), whereas the HCPCS manual lists very specific codes for each item supplied.

The HCPCS codes for Level II have five characters, either numbers, letters, or a combination of both. At times, there are also two-character modifiers, either two letters or a letter with a number. These modifiers are different from the CPT modifiers but may be used with CPT codes as well as with Level II codes. For example, HCPCS modifiers may indicate social worker services (HO) or equipment rentals (KH). Appendix 2 of the HCPCS manual gives a complete list of all HCPCS modifiers.

Examples of Level II codes are listed here:

Code Number	Description
A0225-QN	Ambulance service, neonatal transport, base rate, emergency transport, one way, furnished directly by the provider of services
E0781	Ambulatory infusion pump, single or multiple channels . . .
G0008	Administration of influenza virus vaccine
G0104	Colorectal cancer screening; flexible sigmoidoscopy
Q0091	Screening Papanicolaou (Pap) smear; obtaining, preparing, and conveyance of cervical or vaginal smear to laboratory
V5298	Hearing aid, not otherwise specified

In medical offices where the HCPCS system is used, regulations issued by CMS are reviewed to determine the correct code and modifier for use on each payer's claims. Medical assistants who code with the HCPCS manual find its steps for coding mimic those of CPT, except that the Alphabetic Index is found in the front of the manual, with the alphanumeric index toward the back.

As with all coding procedures, the first step is to locate the description of the service, procedure, or item in the Alphabetic Index. Once this is located, note the code(s) or code range given and move to that area of the alphanumeric index to verify the description. Choose the code description that exactly matches the service, procedure, or item supplied as documented in the medical record. If you are coding medications supplied to the patient, you will find it easiest to locate the drug name in the Table of Drugs found in Appendix 1 of HCPCS. This table lists the unit, route of administration, and appropriate "J" code. Even though only one code is given, do not skip the step of verifying the information in the alphanumeric index.

Once all CPT and HCPCS codes are located and verified, enter them in block 24D of the CMS-1500 form if your office is not computerized. Otherwise, enter the codes in the appropriate area of the office medical billing software so that the information may be transmitted to the health insurance carrier electronically. Procedure 19-2, at the end of the chapter, outlines the steps for locating a HCPCS code. Procedure 19-3 outlines the procedure for entering CPT (HCPCS) and ICD codes into an electronic system.

► Coding Compliance LO 19.7

Licensed practitioners have the ultimate responsibility for proper documentation and correct coding as well as for compliance with regulations, but many expect their medical assistants to have working knowledge of these, too. Medical assistants help ensure maximum appropriate reimbursement for reported services by submitting correct healthcare claims. These claims, and the process used to create them, must comply with the rules imposed by federal and state law and with payer requirements.

Code Linkage

As you learned in the *Insurance and Billing* chapter, clean claims are those in which each reported service is connected to a diagnosis that supports the procedure as necessary to investigate or treat the patient's condition. Insurance company representatives analyze this connection between the diagnostic and the procedural information, called code linkage, to evaluate the medical necessity of the reported charges. Correct claims also comply with many other government agency regulations.

The possible consequences of inaccurate coding and incorrect billing include the following:

- Denied claims
- Delays in processing claims and receiving payments
- Reduced payments
- Fines and other sanctions
- Loss of hospital privileges
- Exclusion from payers' programs

- Prison sentences
- Loss of the practitioner's license to practice medicine

To avoid errors, the codes on healthcare claims are checked against the medical documentation. A code review, also known as a coding audit, checks these key points:

- Are the codes appropriate to the patient's profile (age, gender, condition; new or established), and is each coded service billable?
- Is there a clear and correct link between each diagnosis and procedure?
- Have the payer's rules about the diagnosis and the procedure been followed?
- Does the documentation in the patient's medical record support the reported services?
- Do the reported services comply with all regulations?

Insurance Fraud

The majority of those involved in the delivery of healthcare are trustworthy people devoted to patients' welfare. However, some people are not. For example, according to the Department of Health and Human Services (DHHS), in 2013 alone, the federal government recovered more than \$1.57 billion in judgments, settlements, and other fees in healthcare fraud cases. Fraud is an act of deception used to take advantage of another person or entity (refer to the *Legal and Ethical Issues* chapter). For example, it is fraudulent for people to misrepresent their credentials or to forge another person's signature on a check.

Claims fraud occurs when physicians or other practitioners falsely represent their services or charges to payers. For example, a provider may bill for services that were not performed (phantom billing), overcharge for services, or fail to provide complete services under a contract. A patient may exaggerate an injury to get a settlement from an insurance company or ask the medical assistant to change the date a service was actually provided so that the service is covered by a health plan policy that is no longer active.

A number of coding and billing practices are fraudulent. Investigators reviewing physicians' billings look for patterns like these:

- Reporting services that were not performed
Example: A lab bills Medicare for a general health panel (CPT 80050) but fails to perform one of the tests in the panel.
- Reporting services at a higher level than was carried out
Example: After a visit for a flu shot, the provider bills the encounter as an evaluation and management service plus an injection.
- Performing and billing for procedures not related to the patient's condition and therefore not medically necessary
Example: After reading an article about Lyme disease, a patient is worried about having worked in her garden over the summer and requests a Lyme disease diagnostic test. Although no symptoms or signs have been reported, the physician orders and bills for the Lyme disease test, stating an exposure had occurred.

- Billing separately for services bundled in a single procedure code (unbundling)

Example: When a physician orders a comprehensive metabolic panel (CPT 80053), the provider bills for the panel as well as for a quantitative glucose test, which is included in the panel.

- Reporting the same service twice

Example: The office submits a claim the same day the patient is in the office for a urinalysis, but the patient was unable to produce a specimen. When the patient returns later in the week with the specimen, a second claim is submitted for the urinalysis.

Note that HIPAA calls for penalties for giving remuneration to anyone eligible for benefits under federal healthcare programs. The forgiveness or waiver of copayments may violate the policies of some payers; others may permit forgiveness or waiver if they are aware of the reasons for the forgiveness or waiver, such as the patient's inability to pay (be sure to have documentation of such inability to avoid charges of discrimination). Routine forgiveness or waiver of copayments or deductibles constitutes fraud when billing federal programs like Medicare or TRICARE. The practice should ensure that its policies on copayments are consistent with applicable law and with the requirements of its agreements with payers.

Compliance Plans

To avoid the risk of fraud, medical offices have a compliance plan to uncover compliance problems and correct them. A compliance plan is a process for finding, correcting, and preventing illegal medical office practices. Its goals are to

- Prevent fraud and abuse through a formal process to identify, investigate, fix, and prevent repeat violations relating to reimbursement for healthcare services provided.
- Ensure compliance with applicable federal, state, and local laws, including employment laws and environmental laws as well as antifraud laws.
- Help defend providers if they are investigated or prosecuted for fraud by showing the desire to behave compliantly and thus reduce any fines or criminal prosecution.

When a compliance plan is in place, it demonstrates to payers like Medicare that honest, ongoing attempts have been made to find and fix weak areas of compliance with regulations. The development of this written plan is led by a compliance officer and committee with the intention to (1) audit and monitor compliance with government regulations, especially in the area of coding and billing; (2) develop consistent written policies and procedures; (3) provide for ongoing staff training and communication; and (4) respond to and correct errors. Although coding and billing compliance are the compliance plan's major focus, it covers all areas of government regulation of medical practices, such as equal employment opportunity (EEO) regulations (for example, hiring and promotion policies) and OSHA regulations (for example, fire safety and handling of hazardous materials like bloodborne pathogens). For further information, go to <http://www.oig.hhs.gov/fraud/docs/complianceguidance/thirdparty.pdf>.

PROCEDURE 19-1 Locating a CPT Code

Procedure Goal: To locate correct CPT codes using the CPT manual

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Patient record, superbill or charge slip containing procedure(s) performed, and CPT manual

Method:

1. Find the services listed on the superbill (if used) and in the patient's record.

RATIONALE: *Only documented services and procedures may be coded for submission to the insurance carrier.*

- a. Check the patient's record to see which services were documented. For E/M procedures, note whether the patient is a new or established patient and then look for clues as to the location of the service and the extent of the history, examination, and medical decision making that were involved.

RATIONALE: *To code E/M services correctly, all of this information is required.*

2. Look up the procedure code(s) in the Alphabetic Index of the CPT manual.

- a. Verify the code number in the Tabular List, reading all notes and guidelines for that section.

RATIONALE: *All codes must be verified in the Tabular List; never code only from the Alphabetic Index.*

- b. If a code range is noted, look up each code in the range and choose the correct code given in the

Tabular List. If the correct description is not found, start the process again. Use the same process if multiple codes are given, looking each one up in the Tabular List until you find the correct code description.

RATIONALE: *The Tabular List gives specific information and direction not found in the Alphabetic Index.*

3. Determine appropriate modifiers.

- a. Check section guidelines and Appendix A to choose a modifier if needed to explain a situation involving the procedure being coded, such as bilateral procedure, surgical team, or a discontinued procedure.

RATIONALE: *Modifiers give the payer specific information about the procedure, which may affect payment for that procedure.*

4. Carefully record the procedure code(s) on the healthcare claim or, if the office is computerized, enter the codes into the office billing system for placement on an electronic health claim form. Usually, the primary procedure—the one that is the primary reason for the encounter or visit—is listed first.

5. Match each procedure with its corresponding diagnosis. The primary procedure is often (but not always) matched with the primary diagnosis.

RATIONALE: *This code-linking provides the payer with the medical necessity for each procedure—the reason the service or procedure was needed.*

PROCEDURE 19-2 Locating a HCPCS Code

Procedure Goal: To locate correct HCPCS codes using the HCPCS manual

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Patient record, superbill or charge slip containing procedure(s) performed, and HCPCS manual

Method:

1. Locate the service, supplies, and equipment requiring a HCPCS code from the encounter form or from the patient's record. If an encounter form is used, verify procedure completion in the medical record.

RATIONALE: *Only services, supplies, and equipment documented as provided may be billed to the insurance carrier.*

2. Use the Alphabetic Index in the beginning of the manual to locate the section in which the category of codes is found.

3. Find the code or code range listed, reading descriptions carefully. Do not code from the Alphabetic Index.

RATIONALE: *The Tabular List includes further information on each code so that the correct code can be chosen.*

4. Look up the code or each code in the code range listed in the Tabular List. Read descriptions carefully.

RATIONALE: *The Tabular List includes further information on each code so that the correct code can be chosen.*

5. Make sure the code is valid for the type of insurance the patient carries.

RATIONALE: *If the insurance carrier does not accept HCPCS codes, the equivalent CPT code will need to be used instead of HCPCS.*

6. Enter the correct code(s) on the superbill, or encounter form, if necessary and, if the office uses a computerized billing program, in the patient's computerized record so that it can be used for billing purposes. Otherwise, place the HCPCS code in block 24D of the 1500 claim form for submission to the insurance carrier. Match each HCPCS code with the appropriate diagnosis code to demonstrate medical necessity.

RATIONALE: *This code-linking provides the payer with the medical necessity for each procedure—the reason the service or procedure was needed.*

PROCEDURE 19-3 Entering CPT/HCPCS and ICD Codes into an EHR Program

Procedure Goal: To enter procedure and diagnosis codes into the Practice Fusion® EHR/billing program

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Paper or electronic superbill, patient's medical record, and a computer with Practice Fusion® EHR program loaded

Method:

1. Log in to the Practice Fusion® EHR Program as instructed and from the Tasks on the right side of the screen, choose **Charts**.
2. Double-click the name of the patient requiring EHR update with procedural and diagnostic coding for billing to the insurance carrier.
3. From the right side of the patient's screen choose the encounter date requiring code insertion by double-clicking it.
4. Scroll down the screen to locate the Diagnosis section and click **Record**.
5. In the blank diagnosis field that appears, key the first few letters of the first diagnosis. From the available listing, reading carefully, choose the diagnosis code and description required.
RATIONALE: *The diagnosis will become a permanent part of the patient's medical history and record; choose carefully.*
6. If a start date for the diagnosis is known, enter it in the appropriate field. If medications were given for this diagnosis, click **Medications** and they may be listed if desired. Otherwise, at the bottom of the screen, select

the box next to **Attach Diagnosis to this Encounter** and click **Done**.

RATIONALE: *The diagnosis now becomes part of the medical necessity for this visit.*

7. Repeat the process to add all diagnoses pertaining to this encounter.
8. To add all procedures and services provided during this encounter, move to the bottom of the screen and click the **Record** button next to **Superbill**.
9. In the procedure field, enter the CPT code desired.
10. Check the description for the CPT or HCPCS code entered, making sure it matches the procedure performed. If so, click the procedure and the code will be entered.
RATIONALE: *The procedure selected will be billed to the insurance plan. It must match the medical record describing the procedures or services provided during this encounter.*
11. In the next field, add any required modifiers to the procedure code following payer guidelines.
12. In the diagnosis field, select the diagnosis from the list that has been saved for this patient; that is the reason this procedure or service was provided.
RATIONALE: *The diagnosis provides the medical necessity or reason the service or procedure was required.*
13. Enter the number of units (or times) the service was provided on this date.
14. At the top-right corner of the screen, click **Save** after checking your work.
15. Repeat these steps for each procedure or service performed until all services are recorded and diagnosis is attached, and perform a final save.

SUMMARY OF LEARNING OUTCOMES	
LEARNING OUTCOMES	KEY POINTS
19.1 List the sections of the CPT manual, giving the code range for each.	The sections for the CPT manual are Evaluation and Management, Anesthesiology, Surgery, Radiology, Pathology and Laboratory, and Medicine, with code ranges from 00100 to 99602.
19.2 Describe briefly each of the CPT's general guidelines.	A CPT code is a 5-digit code representing the service provided to the patient. The CPT manual general guidelines include the following symbols, each of which represents important information about the code being described: blue triangle, red dot, # sign, triangles facing each other, circle with a diagonal through it, lightning bolt, bull's-eye, as well as add-on codes and modifiers. Always begin coding by looking up the description in the Alphabetic Index and verifying in the Tabular (numeric) List. Carefully read all guidelines and information surrounding the codes.

LEARNING OUTCOMES	KEY POINTS
19.3 List the types of E/M codes within the CPT.	The E/M code types include office and other outpatient services; hospital observation; hospital inpatient; consultations; ED services; critical care, nursing facility, domiciliary, and rest home services; domiciliary and assisted-living services; home care plan oversight; home services; prolonged services; case management; care plan oversight; preventative medicine; non-face-to-face physician services; special E/M; newborn care, neonatal ICU, and critical care services; and other E/M services.
19.4 List the areas included in the surgical coding section.	Surgical coding sections include integumentary, musculoskeletal, respiratory, cardiovascular, digestive, urinary, male and female genital systems, endocrine, nervous, eye and ear, radiology, pathology and lab, and medicine.
19.5 Locate a CPT code using the CPT manual.	Student answers will vary depending upon the information (encounter forms or mock medical records) they are given to practice coding with the CPT manual. They should be able to select an accurate code for simple, straightforward coding scenarios.
19.6 Explain how to locate a HCPCS code using the HCPCS coding manual.	Student answers will vary depending upon the information (encounter forms or mock medical records) they are given to practice coding with the HCPCS manual. They should be able to select an accurate code for simple, straightforward coding scenarios.
19.7 Explain the importance of code linkage in avoiding coding fraud.	Code linkage demonstrates the medical necessity of services provided to the patient by accurately linking each procedure code to its appropriate diagnosis. All procedures, services, and diagnoses must be documented in the patient's medical record to be used on any health insurance claim form.

CASE STUDY CRITICAL THINKING

© ERproductions Ltd/Blend Images LLC RF

Recall Raja Lautu from the beginning of the chapter. Now that you have completed the chapter, answer the following questions regarding her case.

1. What is the correct CPT code for the physical examination that was performed on Raja?
2. Code the screening bilateral mammogram using both the CPT and HCPCS coding references. Which payer will require the HCPCS code instead of the CPT?
3. Using the CPT manual, code the ultrasound of the breast and the breast biopsy. Include any necessary modifiers.

EXAM PREPARATION QUESTIONS

1. (LO 19.1) All of the following are sections of the CPT manual *except*
 - a. Anesthesiology
 - b. E/M
 - c. Surgery
 - d. Pathology and Lab
 - e. Integumentary
2. (LO 19.1) Which area gives instructions on how to code within a specific chapter?
 - a. Appendix A
 - b. Section notes
 - c. Guidelines
 - d. Modifiers
 - e. Index
3. (LO 19.2) Which of the following CPT conventions indicates the code is new to the current edition?
 - a. Triangle
 - b. Plus sign
 - c. Lightning bolt
 - d. Red dot
 - e. Bull's-eye
4. (LO 19.2) Which of the following CPT conventions indicates the code description is revised?
 - a. Blue triangle
 - b. Plus sign
 - c. Lightning bolt
 - d. Red dot
 - e. Bull's-eye
5. (LO 19.3) The _____ codes are considered to be the most important of the CPT codes.
 - a. Level II
 - b. E/M
 - c. Add-on
 - d. Unlisted procedure
 - e. Surgical
6. (LO 19.3) For reporting purposes, CPT considers a patient “new” if he or she has not received professional services within the past _____ year(s).
 - a. 1
 - b. 2
 - c. 3
 - d. 4
 - e. 5
7. (LO 19.4) Which of the following are components of a surgical package?
 - a. Preoperative work-up
 - b. Surgery itself
 - c. Usual postoperative follow-up
 - d. All of these
 - e. Only the surgery itself and usual post-op care
8. (LO 19.5) Which of the following is the correct code for vaginal hysterectomy (255 g) including removal of fallopian tubes and ovaries with appendectomy?
 - a. 58291, 44950
 - b. 58291, 44950-51
 - c. 58260, 44955
 - d. 58262, 44950-51
 - e. 58262, 44955
9. (LO 19.6) What is the correct HCPCS code for a folding walker with wheels?
 - a. E0143
 - b. E0141
 - c. E0149
 - d. E0148
 - e. E0144
10. (LO 19.7) The “key” to showing medical necessity for a procedure or service is
 - a. A working compliance plan
 - b. The use of appropriate ICD codes
 - c. Upcoding
 - d. Downcoding
 - e. Accurate code linkage

Recall Raja Lautu from the case study at the beginning of the chapter.

1. Raja is very relieved when her breast biopsy comes back negative; however, she is upset that the insurance company appears to think she already has a history of breast cancer. In looking at her claim form, you see that the coder mistakenly chose a code for history of breast cancer instead of family history of breast cancer. How will you handle this?

2. Physical exam code 99396 was submitted on the same insurance claim form. Is this correct? If not, why not, and how should this be handled?

Medicare. You inform Mr. Evans that the office is a participating provider with Medicare. You bill Medicare and find out from the remittance advice (RA) that Nancy has \$122.65 left on her deductible for this year.

Keep Nancy Evans in mind as you study this chapter. There will be questions at the end of the chapter based on the case study. The information in the chapter will help you answer these questions.

LEARNING OUTCOMES

After completing Chapter 20, you will be able to:

- 20.1** Summarize the importance of and how to establish good bookkeeping and banking practices.
- 20.2** Compare single-entry, double-entry, and write-it-once bookkeeping systems and explain accounts receivable and accounts payable.
- 20.3** Describe the common payment methods accepted in medical practices today.
- 20.4** Identify the different types of documents used as statements to bill patients and how these documents are used in cycle billing.
- 20.5** Compare open-book, written-contract, and single-entry accounts and the purpose of creating an accounts receivable aging.
- 20.6** Explain the purposes of the following credit and collections acts: ECOA, FCRA, FDCPA, and TLA.
- 20.7** Relate the required components of a Truth in Lending Statement to credit practices in the medical office.
- 20.8** Summarize two common types of problem collection accounts in the medical office.
- 20.9** Identify negotiable instruments and the items that must be present for a check to be negotiable.
- 20.10** Describe the different types of check endorsements and the steps in creating a bank deposit.
- 20.11** Carry out the process of reconciling the office bank statement.
- 20.12** List several advantages to electronic banking.
- 20.13** Implement setting up, classifying, and recording disbursements in a disbursements journal.

KEY TERMS

ABA number	check	limited check	skip
accounting	counter check	money order	statute of limitations
accounts payable (A/P)	credit	negotiable	third-party check
accounts receivable (A/R)	credit bureau	open-book account	tracking
age analysis	cycle billing	payee	traveler's check

CAAHEP

- VII.C.1** Define the following bookkeeping terms:
- (a) charges
 - (b) payments
 - (c) accounts receivable
 - (d) accounts payable
 - (e) adjustments
- VII.C.2** Describe banking procedures as related to the ambulatory care setting
- VII.C.3** Describe precautions for accepting the following types of payments:
- (a) cash
 - (b) check
 - (c) credit card
 - (d) debit card
- VII.C.4** Describe types of adjustments made to patient accounts including:
- (a) non-sufficient funds (NSF) check
 - (b) collection agency transaction
 - (c) credit balance
 - (d) third party
- VII.C.5** Identify types of information contained in the patient's billing record
- VII.C.6** Explain patient financial obligations for services rendered
- VII.P.1** Perform accounts receivable procedures to patient accounts including posting:
- (a) charges
 - (b) payments
 - (c) adjustments
- VII.P.2** Prepare a bank deposit
- VII.P.3** Obtain accurate patient billing information
- VII.P.4** Inform a patient of financial obligations for services rendered
- VII.A.1** Demonstrate professionalism when discussing patient's billing record
- VII.A.2** Display sensitivity when requesting payment for services rendered

ABHES

4. Medical Law and Ethics

- f. Comply with federal, state, and local health laws and regulations

5. Psychology of Human Relations

- c. Intervene on behalf of the patient regarding issues/concerns that may arise, i.e. insurance policy information, medical bills, physician/provider orders, etc.

8. Administrative Procedures

- a. Gather and process documents
- b. Perform billing and collection procedures
 - (1) Accounts payable and accounts receivable
 - (2) Post adjustments
 - (3) Payment procedures; i.e. credit balance, non-sufficient funds, refunds

11. Career Development

- b. Demonstrate professional behavior

► Introduction

Often, when you ask someone why he or she entered the medical field, you will hear, “I wanted to be involved with patient care.” Excellent patient care is at the heart of every medical office, but what is behind this heart? The true backbone of the practice—financial management. Without current, sound financial practices and management in place, a medical practice cannot succeed. A licensed practitioner may have a thriving practice and be loved by her patients, but without employees who understand and perform sound business and financial management procedures, the practice will fail and ultimately close. In this chapter, you will explore the practices necessary to keep a successful medical practice thriving.

► The Medical Practice as a Business

LO 20.1

A medical practice is a business. If it is to prosper, its income must exceed its expenses. In other words, it must produce a profit. The process of communicating the income and expenses of a business and its financial health is known as **accounting**. The practice’s finances must be watched closely to be sure that expenses do not exceed income. Part of this process is the systematic recording of business transactions, known as **bookkeeping**. As the office medical assistant, recording daily business transactions may be part of your responsibility. Your records, along with other financial records, will later be analyzed by an accountant or by a more experienced medical assistant to monitor the practice’s financial health. In addition to bookkeeping, banking is another key responsibility of many medical assistants. To fulfill these administrative responsibilities, you need an understanding of basic accounting systems and the procedures surrounding banking and financial management.

Importance of Accuracy

Whenever you perform bookkeeping or banking procedures, strive for 100% accuracy. Because bookkeeping records form a chain of information, an undetected error at the first link will be carried through all other links in the chain. You might compare this to a set of dominoes: If one domino is not perfectly balanced, it will affect all those that come after it, collapsing the entire bunch. Undetected errors in the medical office can result in billing a patient twice for the same visit, omitting bank deposits, or making improper payments to suppliers. These actions can result in lost money—and patients—for the practice. Establishing procedures that are consistently carried out will help ensure accuracy and help keep you from forgetting a potentially important step in the procedure.

Establishing Procedures

Here are some general suggestions to assist you in maintaining accuracy in bookkeeping and banking procedures for your medical practice:

- Be organized. Maintain the practice’s bookkeeping and banking records and written procedures in a logical and organized way.

- Be consistent. Always handle the same kinds of transactions in exactly the same way. For example, endorse all checks with the same information, regardless of who wrote them or when you will be depositing them. Using a pre-printed bank stamp is helpful for consistency with this procedure.
- Use markers. Make check marks as you work to avoid losing your place if you are interrupted. For example, place a red check mark on each checkbook entry as you check it against the bank statement when you reconcile the office checkbook with the bank statement.
- Write clearly. Always use the same type and color pen and clear, easy-to-read handwriting. If more than one person performs bookkeeping and banking tasks, each person should initial her part of the procedure to identify her work. It is recommended that as few people as possible perform these tasks to minimize possible duplication or accidental “skipping” of steps because “Judy and Michaela each mistakenly thought the other had performed the bank reconciliation.” You may use pencil for trial balances and worksheets, but you should use pen for final bookkeeping entries.
- Check your work. Frequently review your work to detect and correct any errors. To correct errors, draw a straight line through the incorrect figure and write the correct figure above it. Never erase errors or delete them with correction fluid or tape. As with medical records, the office financial records are legal documents and every entry, even corrected ones, needs to be readable at all times.
- Use straight columns. Keep all columns of figures straight, so that decimal points align correctly. This makes totaling of figures easier and looks neat and professional.

Using set procedures, even as more and more of these procedures become computerized, will help you organize your work, help ensure accuracy, and make you a more valuable member of the practice staff because others will trust that your work will be concise and accurate.

► Medical Office Accounting Methods

LO 20.2

Patient accounting methods within a medical practice may be computerized or manual, but more and more offices are turning to computerized patient accounting systems. Three types of manual accounting systems may be used by medical practices that are not computerized: single-entry, double-entry, and write-it-once (pegboard) systems. All accounting systems record income, *charges* (money owed to the practice), *disbursements* (money paid out by the practice), and other financial information. The choice of system is based on the size and complexity of the practice. Even if your office is computerized, it is important to have a basic understanding of each of these systems, as you will find that computerized systems work in the same manner. Not only that, but if the office computer system goes down for any reason, you will still need to have a mechanism to track any transactions that take place during the “computer down time.”

Electronic Bookkeeping

Offices that utilize a computerized bookkeeping system enjoy several important benefits over traditional manual bookkeeping methods. With computerized bookkeeping, you save time because

- The computer performs repetitive tasks.
- The computer software automatically performs mathematical calculations.
- Built-in tax tables are available that calculate tax liabilities for you.

Many bookkeeping software programs and practice management software programs are available on the market and perform the same tasks that are performed manually. Understanding these tasks is an essential part of managing books on a computer as well as with a manual system. The practice in which you work may already have a computerized bookkeeping program in place, which you will learn as the office medical assistant. It is also a good idea to stay current on new software programs as they become available by reading computer software magazines or joining your local medical assisting organization, which often keeps members updated on new trends in the market. If you learn about a more efficient way to use the practice’s current financial management software or discover a new software program that you feel might be helpful to your office, gather the pertinent information and make a recommendation to the physician or office manager regarding your proposal.

Manual Bookkeeping Systems

Traditionally, there were two types of accounting systems: single-entry and double-entry. In the single-entry system, a transaction is listed once (each) in the patient ledger, the daily log, and the checkbook. Although simple to use, this system is not self-balancing and errors may easily go undetected. In the double-entry system, all entries are listed twice, based on the accounting formula of Assets = Capital + Liabilities. An asset is anything owned by the company (or practice). Capital is the portion of the asset that is paid for, and a liability is the amount of money owed by the practice on the asset. To better understand this formula, consider the new ECG machine purchased by the practice in the following example. The cost of the machine is \$15,000 and the office made a down payment of \$5,000.

Example:
 $\$15,000 \text{ (Asset)} = \$5,000 \text{ (Capital)} + \$10,000 \text{ (Liability)}$

Every month, when a payment is made, the asset amount will remain the same, but the capital amount will increase and the liability amount will decrease. However, both sides of the equation will continue to balance.

Write-It-Once, or Pegboard, System Most medical offices using a manual bookkeeping system use the **write-it-once (pegboard) system**, which contains a formula to check your work. The write-it-once system uses the same bookkeeping forms as the single- and double-entry systems, but the day sheet, also called the daily log, has pre-punched holes on the right or left side of the log. There are similar holes in the shingled (layered) charge sheets that are placed in designated areas on top of the day sheet, which has been placed on the pegboard. Each charge sheet is made with no-carbon-required (NCR) paper, so when the patient ledger card is placed between the day sheet and charge sheet and an entry is made, it appears on all three documents at the same time—hence the term “write-it-once.” You will examine this system in more detail later in the chapter.

Bookkeeping Forms Regardless of the type of bookkeeping method used, all of these systems use similar forms and records to maintain the bookkeeping system. Each form is discussed in further detail in the following paragraphs.

Daily Log The daily log is also known as a general ledger, day sheet, or daily journal, depending on the practice. Regardless of the name used, it is a chronological list of each patient’s charges, any payments made on the account, and any adjustments on the account (like the difference between the charge billed to the insurance carrier and the “allowed charge” that the payment is based on). See Figure 20-1. In the daily log, you record the name of each patient seen that day. Across from the name, you record the service provided (using the proper procedure codes), the fee charged, and the payment (if any) received. This process is called **journalizing**. You then post (copy) the charges, adjustments, and payments from the daily log to patient ledger cards. Using a daily or monthly cash control sheet, you record checks and cash received as well as deposits made each day.

Date: 4/15/XX							
Patient	Service	Charge	Payment	Adj	Cur Bal	Prev Bal	MD
Washington, Ken	99212, 93000	150.00	25.00		125.00	0.00	PFB
Ramirez, Valarie	99213	80.00			190.00	110.00	PFB
Lautu, Raja	99384	145.00	20.00		160.00	35.00	EHW
Chen, Cindy	99215, 36415	210.00		25.00	185.00	0.00	ANW
Matthews, Chris	99212	65.00	65.00		0.00	0.00	ANW
TOTALS		650.00	110.00	25.00	660.00	145.00	

FIGURE 20-1 The daily log is used to record all patient-based financial activity in the office for each day.

In most offices, medical assistants maintain the daily log. You can obtain the information you need to post transactions from the charge slip, which may also be called the encounter form or superbill. (Note: A charge slip is the original record of all of the doctor's charges and services performed on that day for an individual patient.) Because some charge slips include the areas for payment and next appointment information, the term *superbill* is often used. Typically, a charge slip/receipt includes duplicate (and sometimes triplicate) copies underneath to use for bookkeeping purposes—one copy for the patient, one for the medical office, and one for the business office, if that is a separate entity. Remember, you need to track charges *and* receipts for payment, for each patient, regardless of the bookkeeping method used. If the provider also performs house calls or visits to nursing homes, records of these visits must also be accounted for, so additional copies of charge slips may be sent with the provider to use when visiting these outside facilities.

As a medical assistant, it is also your job to record any night calls or other unscheduled visits in the daily log. Simply check with the provider each morning to determine if a charge slip needs to be generated to record the proper fees. If the physician has not noted the charge amount on a charge slip/receipt or record of outside visits, you may have to apply the appropriate fees according to the agreed-upon fee schedule for your office.

In addition to payments made by patients while in the office, other payments will come into the office by mail from both insurance companies and patients. These payments also must be recorded in the daily log for proper tracking of **accounts receivable (A/R)**. When payment is sent from an insurance company, it is usually in the form of a check (or electronic payment) and has an explanation of benefits (EOB) or remittance advice (RA) attached, displaying the amount paid on each patient's behalf. You must post the amount indicated to each patient account and record any adjustment required according to the contract the practice has with the insurance company.

If extra columns are available, and if it is part of office policy, you also may record additional financial information in the daily log. For example, in addition to showing the total amount charged to the patient, you might show a breakdown of that total into the amounts generated by different practitioners in a group practice or by different functions of the office, such as the laboratory or X-ray department.

At the end of each day, total the charges and receipts in the daily log and post these totals to the monthly summary of charges and receipts. To double-check your totals, perform the following steps, outlined in Procedure 20-1 at the end of this chapter:

- Ensure that the day's total cash and check receipts are the same as the day's total bank deposit.
- Ensure that the sum of the day's charges for each type of service is the same as the total of the day's charges.

Patient Ledger Cards Another bookkeeping task is preparing a *patient ledger card* for each patient. This card includes the patient's name, address, home and work telephone numbers, health insurance information, Social Security number, and employer's name; the name of the guarantor (the

one who is responsible for payment of the charges, if different from the patient); and any special billing instructions. Figure 20-2 shows an example of a patient ledger card.

You will use the patient ledger card to record charges incurred by the patient, payments received, adjustments made, and the resulting balance owed to the doctor as described in Procedure 20-1. Because these cards document the financial transactions of the individual patient account, they are sometimes called *account cards*. In some practices that perform manual billing procedures, they are photocopied for use as monthly statements.

The information for the patient ledger cards comes from the daily log and includes the information found on the superbill (charge slip). It is best to complete all the cards at the end of each business day. If this is not possible, you may complete them as time permits during the next business day. To prevent duplicate or omitted postings, put a small check mark next to each entry in the daily log after you post it to the proper ledger card. Take great care when posting because errors posted on the patient's ledger card will be reflected on the patient billing statements. To ensure accuracy, add up the total charges and receipts from the ledger cards and make sure the information matches the total charges and receipts in that day's daily log.

When working with patient financial records, including patient ledger cards, keep in mind that each patient's financial records must be kept just as confidential as his or her medical record information. Regardless of whether you are working with paper financial records or using an electronic system, just as with medical information, be sure that only those staff members with a "need to know" are allowed access to any patient's financial information.

Bookkeeping Records Regardless of whether the office bookkeeping system is computerized or manual, the records kept on the office finances remain the same. Let's look at each of these records.

Accounts Receivable Each day, you must update the accounts receivable record, which shows the total owed to the practice (the amount able to be received but not yet received). Total up the items on the accounts receivable record and then total up the outstanding balances on the patient ledger cards. The two numbers should match. If they do not, recheck your work to find the cause of the discrepancy.

Accounts Payable **Accounts payable (A/P)** are the amounts the practice owes to vendors (the amount able to be paid but not yet paid). If your responsibilities include accounts payable, keep careful records of equipment and supplies ordered and compare orders received against the invoices. In the checkbook register, keep detailed and accurate records of accounts paid.

Record of Office Disbursements This record is a list of the amounts paid for items like medical supplies, office rent, office utilities, employee wages, postage, and equipment over a certain period of time. It shows the **payee** (the person who will receive the payment), the date, the check number, the amount paid, and the type of expense. Figure 20-3 is an example of a disbursement record.

Patient's Name	Jonathan Jackson

FIGURE 20-2 A patient ledger card shows an individual patient's charges, adjustments, receipts, and balance due.

A checkbook register may be used to record office disbursements. As an alternative, a disbursement journal or the bottom section of the daily log may also be used to record office disbursements. For income tax purposes, this record should include only office expenses. The practitioner's personal expenses should not be listed here.

Summary of Charges, Receipts, and Disbursements

Charges, receipts, and disbursements are usually summarized at the end of each month, quarter, or year depending on your office policies and procedures (Figure 20-4). The summary is used to compare the current period's income and expenses with any previous period's income and expenses.

By analyzing summaries, a provider (or practice manager) can see which functions of the practice are profitable, the total amount charged for services, the payments received for services, the total cost of running the office, and a breakdown of expenses into various categories. Based on this information, the practice can make vital business decisions. For example, after analyzing monthly summaries, it may decide to budget expenses differently, collect payments more promptly, cut unprofitable services, or expand profitable services.

Although an accountant may prepare these reports, an experienced administrative medical assistant can prepare them. If you are asked to prepare them, follow these guidelines.

FIGURE 20-3 The office disbursements journal is a record of payments made by the office, showing who was paid, when the payment was made, and the amount paid.

- Every business day, post the total charges and receipts from the daily log to the appropriate line and column of the monthly summary.
- Each business day, also post the disbursements from the record of office disbursements to the appropriate lines and columns of the monthly summary.
- At the end of the month, total the columns on the monthly summary.
- At the end of each quarter, post the charges, receipts, and disbursements for each of the previous 3 months to the quarterly summary. Then, total each column.
- At the end of the year, post the charges, receipts, and disbursements for each of the previous 12 months (or 4 quarters) to the annual summary. Then, total each column.

Remember, the total charges and total receipts in any summary should be almost the same. They may not be identical because some bills may not have been fully collected.

► In-Office Transactions

LO 20.3

Once health insurance claims have been filed and the insurance pays its portion of the patient's charges, the patient will be held accountable for his portion of the fees. Billing and collections are vitally important tasks because they convert the practice's accounts receivable into income, or cash flow, from which

the accounts payable can be paid. Unless billing and collections are carried out effectively, a practice might have plenty of money due in accounts receivable but not enough cash on hand to pay its accounts payable, including staff salaries.

There are methods of improving billing and collection procedures to increase income for the practice. You will need to know about standard payment, billing, and collection procedures as well as credit arrangements and common problems in collecting payment. Patients who have insurance (a third-party payer) often request that the office submit a claim to the insurance carrier and then bill them for the balance, and most offices do so. It makes good business sense, however, if a patient belongs to a managed care organization (MCO) with a known copayment for each visit that this charge should be collected at each visit. And most medical offices require this. (Refer to the *Insurance and Billing* chapter for more information.) Immediate patient payment not only brings income into the practice faster but also saves the cost of preparing and mailing statements (patient bills) and collection of past-due accounts. Many offices post a small sign at the reception desk that states, for example, "Payment is requested when services are rendered unless other arrangements are made in advance." As the medical assistant, you are responsible for collecting these payments. If the patient cannot pay all or part of the charges at the time of the visit, it may be your responsibility to bill for the practitioner's services and possibly to extend credit utilizing payment plans for larger patient-due balances.

FIGURE 20-4 Depending on office policy, the monthly, quarterly and/or yearly summary of office charges, receipts, and disbursements is used to summarize the office financial health.

Starting the Business Day

At the beginning of each day, place a daily log sheet on the pegboard. Then, place the stack of superbills (charge slips/receipts) on the pegs, aligning the top line of the first superbill with the daily log top line. Because the superbills are layered one over the other from top to bottom, alignment of the first will align all others. The superbills are prenumbered. This numbering promotes good cash control and theoretically prevents embezzlement. Figure 20-5 shows the setup for the pegboard system.

Patient Process

As each patient comes in to the office, place the patient's ledger card under the next available superbill, aligning the card's first blank line with the carbon strip on the superbill. Write the date, the patient's name, and the patient's previous balance on the charge slip section. The information will automatically be recorded in the daily log and on the patient ledger card. Most pegboard sheets also contain a column just to the right of the superbill where the preprinted number of the patient's superbill may be recorded on the day sheet as a checks and balances entry.

Attach the Superbill to the Patient Chart

Remove the superbill and attach it to the patient chart so that it is ready for the provider to check off both the services

provided and the applicable diagnoses for the day's visit. After examining the patient, the provider checks off or fills in the appropriate charges and diagnoses on the superbill, indicates when the next appointment is needed, and gives the superbill to the patient to return to the front desk on the way out.

Patient Checkout

When the patient returns the completed superbill you again place the ledger card between the superbill and the daily log, checking to ensure proper alignment. On the superbill, enter the date, procedure (or code), charges, payments, new balance, and date and time of the next appointment (if any). As you write this information, it should be automatically transferred onto the ledger card and daily log. Finally, tear off the receipt and give it to the patient. You can now return the patient ledger card to the file.

Accepting Patient Payment

When the patient comes to you at the completion of his visit with the superbill (refer to the *Insurance and Billing* chapter), you enter the charges for the services provided (if they are not preprinted on the form) and ask for payment. There are several effective yet diplomatic ways to request payment. Two examples are "For today's visit, the total charge is \$50. How

FIGURE 20-5 Using the pegboard system, shown here with a correctly aligned ledger card and superbill on the pegboard.
Courtesy of Bibbero Systems, Inc.

would you like to pay for that today?” and “The charge for your laboratory work today is \$80. Would you like to pay for that now?” The first example is the preferred method because, in the second example, asking the patient if he would like to pay for the service now leaves him open to say, “No, bill me,” which will slow your cash flow and cost the practice the expense of sending a billing statement. Computerized offices post the payments to the patient’s account using the office billing software. Offices that use a manual, paper system often use the previously described write-it-once, or pegboard, system, which allows you to record the payment on the patient ledger card and produce a receipt for payment simultaneously.

To encourage patients to pay for treatment at the time of service, most practices accept several forms of patient payment, including cash, check, and debit and credit cards. Giving the patient these options encourages payment at the time of service.

Cash If the patient chooses to pay in cash, count the money carefully to be sure you have received the proper amount. Next, record the payment on the patient’s ledger card or, with a computerized system, credit the patient’s account per system instructions and give the patient a receipt.

Once the money is posted to the account, a computerized billing program gives you the option of printing a receipt you can give to the patient. If the office uses superbills, one of the copies can be given to the patient as the receipt. If your office does not use either of these methods, prepare a cash receipt manually, as shown in Figure 20-6. Be sure that whatever method is used, the office also retains a copy of the receipt. Then place the money in the cash drawer or cash box.

FIGURE 20-6 A receipt such as this may be used when the patient makes a payment while in the office.

Check If your office accepts checks, always ask for proof of identity if you do not know the person writing the check, to avoid the accidental acceptance of fraudulent checks. The check should be completed fully and correctly. Many offices have a stamp with the office name on it for patient convenience and to ensure that the practice name is spelled correctly. Unless the patient has made previous arrangements, the check should be made out for the full amount owed. Verify that the check is dated for the current date and signed when accepting it. Endorse it immediately and place it with other checks for the day’s deposit. If a check is returned for nonsufficient funds (NSF), notify the patient immediately,

FIGURE 20-7 Swiping a debit or credit card produces instant payment authorization from the financial institution or credit card company.

© Exactstock/SuperStock RF

requesting payment in full by another method. Many offices subsequently insist that the patient be seen on a cash-only basis, unless the patient can produce a valid credit card (assuming the office takes credit cards). The office is also allowed to charge the patient an additional fee for the expense of processing the NSF check. You will learn more about this process a bit later in the chapter.

Debit Card Many patients use debit cards instead of paying by cash or check. A debit card looks like a credit card but immediately transfers the funds from the patient's bank account to the practice account. The advantage to the practice is that if there are insufficient funds in the account, the transaction will be refused and other arrangements can be made immediately. Debit cards, like credit cards, are read through electronic readers (Figure 20-7) and the patient inputs a personal identification number (PIN) verifying his or her wish that funds be transferred.

Credit Card Many medical practices accept credit cards, such as Visa or MasterCard. This payment method offers advantages for both the practice and the patient. For the practice, it provides prompt payment from the credit card company, thus increasing cash flow. It also reduces the amount of time and money spent on preparing and mailing statements, thus decreasing expenses. For the patient, it is convenient and allows a large bill to be paid in several smaller amounts, usually once a month.

Credit cards have one major disadvantage for the practice—cost. The credit card company deducts a percentage of each transaction for its collection service, usually between 1% and 5%. If a patient charges \$100 in services on a credit card, for example, the practice receives only \$95 to \$99. The credit card company keeps the difference. Some banks are beginning to charge a similar fee for the convenience of accepting debit cards as well. A disadvantage for patients is the accrued interest charges on unpaid balances.

If the practice accepts credit card payments, the American Medical Association (AMA) suggests several guidelines.

- Do not set higher fees for patients who pay by credit card.
- Do not encourage patients to use credit cards for payment.
- Do not advertise outside the office that the practice accepts credit cards.

If a patient chooses to pay by credit card, process the transaction carefully to ensure that the credit card company charges the patient correctly. Check the expiration date on the front of the credit card. If the card has expired, it cannot be used for payment. Swipe the card through an electronic reader or record it through the use of a credit card machine that mechanically records the information on the card. To operate a credit card machine, place the credit card in the machine and place a credit card voucher on top of it. Slide the imprint arm firmly to the right and back across the machine. Remove the voucher from the machine. Write in the date and circle the type of credit card, such as Visa or MasterCard, after it is removed from the machine. Return the credit card to the patient.

Next, obtain the authorization code from the credit card company. Some offices have devices that read the magnetic strip on the credit card and automatically transmit the information to the credit card company electronically (Figure 20-7). If your office has such a device, type in the amount to be charged on its keypad. Then, the credit card company issues an authorization code, which appears on the device's screen.

If your office does not have such a device, call the credit card company for the authorization code. Give the operator the patient's credit card number and the amount of the payment. The operator then gives you the authorization code.

Write the authorization code in the box marked "Authorization" on the credit card voucher. Initial the voucher in the appropriate box. Then, fill in the services provided and the amount of the charges. Enter the total charges in the box marked "Total."

Give the receipt to the patient to sign. Compare the patient's signature on the receipt with the signature on the back of the credit card (they should be identical). Keep one copy of the receipt for the office. Give the other copy (and the credit card) to the patient.

When the payment comes in from the credit card company, they will have deducted their fee from the funds being deposited in the office account. When posting these payments to the individual patient account, you will need to adjust (write off) the amount withheld by the credit card company so that the patient is not inadvertently billed for this charge.

Online Payments Many hospitals and larger practices that accept credit and debit card payments also accept payments online through their websites or via the patient's online banking program. The payment is then directed into the office checking account with notification to the practice so that the patient's account can be credited appropriately.

Payment Responsibility

The person with financial responsibility for the patient is known as the **guarantor**, the person who "guarantees" payment. In most cases, any patient who is 18 or over is legally considered to be her own guarantor. This is true even if someone else (such as a spouse or parent) is the insured person (the person who

carries the insurance for the family). As with every rule, there are some exceptions to this rule. A few are listed here.

Responsibility for Minors When a child's parents are married, either parent may consent to treatment for the minor child. Both parents are responsible for payment for the minor's treatment, although usually only one is listed on the patient's account as the guarantor. If you must send a bill for services provided to a minor child, it should be addressed to the guarantor to ensure payment. Emancipated minors are the exception to this process. If you have been shown legal proof of emancipation, any bills will be addressed to the emancipated minor; because of the emancipation process, the minor is legally responsible for her bills.

The legal and financial arrangements of a divorced couple are private. Unless you have legal documentation stating otherwise (retain a copy of this document in the patient financial record), you should assume that the parent bringing the patient to the office has consent ability and payment responsibility. Unless you have documentation otherwise, it should be made clear to the parents that payment is due at the time of the visit, regardless of which parent brings the child to the office. Refer to the *Legal and Ethical Issues* chapter for a more in-depth discussion on this topic.

Elderly Patients and Patients with Disabilities

Sometimes when elderly patients or patients with disabilities are brought in for medical care, you may be asked to send the bill to another party such as an adult child. Because of HIPAA confidentiality laws, you cannot send a patient's bill to another person without first obtaining written consent to do so from the patient and the person accepting responsibility for payment. If the patient has been found to be incompetent, you should request proof of legal guardianship (keeping a copy in the patient's financial file) prior to sending a bill to the guardian.

Professional Courtesy Although much less common than in the past, a practitioner may treat some patients free of charge or for just the amount covered by the patient's insurance. This practice is known as professional courtesy. These patients often include other practitioners and their families, the practice's staff members and their families, other healthcare professionals, and clergy members. If the patient is part of a managed care organization or has Medicare, the provider must collect any copayment or deductible as part of the contracted agreement with the insurance carrier. It is considered fraud to consistently not collect copayments or deductibles if the collection of such payments is stipulated in the provider-insurer contract.

Follow the office policy regarding provision of professional courtesy. If you are unsure, check with the practitioner or office manager before making such adjustments to any patient's account.

▶ Standard Billing Procedures

LO 20.4

In today's practice, most offices receive payments from insurance carriers and then find they must bill the patient for any balance due. As the medical assistant, part of your duties may include preparing these patient billing statements. You also

may have to manage related billing responsibilities, such as establishing and maintaining billing cycles.

Preparing Statements

Part of the medical assistant's job may be to prepare statements to mail to patients who do not pay when services are rendered or who make only a partial payment. Figure 20-8 shows a statement with an itemized list of services. You can obtain most of the information for the statement from the patient ledger card or from the patient's computerized account. Regardless of the format used, all statements should include the following information:

- Practice name, address, and telephone number (usually preprinted on the statement or prepared by the computer program)
- Patient's name and address
- Guarantor's name (if different from the patient)
- Balance (if any) from the previous month(s)
- Itemized list of services and charges, by date, for the current month
- Payments from the patient or insurer during the month
- Total balance due

Whatever billing procedure you use, enclose a self-addressed envelope with the statement to encourage prompt payment. Some offices have found that using a lightly colored return envelope, such as pale yellow, actually encourages faster payment because the color stands out against the usual white envelopes, jogging the patient's memory to "pay that one."

Manual Statements If the office wishes to produce manual statements, a template can be made on the computer in a format similar to Figure 20-8. Each procedure should be listed using abbreviations for common procedures, such as OV for office visit. Be sure that an explanation of the abbreviations appears on the statement, usually at the bottom. Also include the CPT codes for the procedures performed. Some statements also include the diagnosis code attached to each procedure. Using an itemized list of services provided on statements is standard practice in most medical offices, as it decreases the number of patient calls asking, "Why am I being billed?" After completing the statement, fold it in thirds and mail it in a typewritten or window business envelope.

The Patient's Ledger Card as a Statement A common alternative to typing up statements, especially in smaller, noncomputerized offices, is to photocopy the patient's ledger card and fold the photocopy so that the patient's address shows through the window in a window envelope. If your practice uses ledger cards for this purpose, be sure there are no stray marks or comments on the card and that the copy is clean and easy to read.

Computer-Generated Statements If the practice utilizes an electronic billing program, statements similar to Figure 20-8 will be produced by the program, either automatically at certain times during the month after insurance payments

have been made and a patient balance remains or on demand with a few keystrokes. Follow the instructions in the software procedure manual. You can then fold the printouts and mail them in window envelopes with a return payment envelope.

Using an Independent Billing Service Large practices may have both their insurance and patient billing procedures handled by an independent billing service. In addition to billing the insurance plan, the billing service may rapidly copy ledger cards or produce computer-generated statements listing the practice business office address for patients with balances due. The statements are then mailed to patients, usually with an envelope for sending payment directly to the provider's office.

Using the Superbill as a Statement

As stated earlier in the chapter, many paper-based practices still use a superbill (encounter form), which lists the charges and procedure codes (CPT) for services rendered on that day, including appropriate diagnoses and codes (ICD). As a carbonless form, when the charges and any payments are entered on the superbill, an automatic receipt and first statement are generated at the same time, saving time and money. Some offices even give the patient a return envelope if there is a balance on the account to encourage prompt payment, as this is considered the first bill received by the patient. Procedure 20-2, located at the end of the chapter, will give you practice billing with a superbill.

Managing Billing Cycles

Smaller practices send out their statements monthly, usually at the end of the month. Larger practices tend to spread the billing process out over the month in a process known as **cycle billing**. In cycle billing the accounts are split into groups and statement mailing dates are staggered.

For example, you may bill on the fifth of the month for patients whose last names begin with A through D. Then, on the tenth of the month, you may bill patients whose names begin with E through H, and so on. Using cycle billing not only staggers the workload throughout the month, but also tends to spread out the payments coming into the office, giving the office a more even cash flow.

▶ Standard Collection Procedures LO 20.5

Although many patients pay a statement within the standard 30-day period, some do not. When a patient does not pay his bill during the standard period, you need to take steps to collect the payment. For example, you may need to call or write the patient to determine the reason for nonpayment or to set up a payment arrangement.

Whether you use telephone calls, notes, or letters, there are laws, such as each state's statute of limitations, as well as professional standards and guidelines to direct your efforts in collecting overdue payments from patients.

Statute of Limitations

A **statute of limitations** is a state law that sets a time limit on when a collection suit on a past-due account can legally be filed. The time limit varies with the type of account and the state in which the debt was incurred.

Open-Book Account An account that is left open to charges that are made on an intermittent basis is known as an **open-book account**. Most of a provider's long-standing patients have this type of account. An open-book account uses the last payment date or the date of the last charge for each illness as the start date to determine the time limit for that specific debt.

Written-Contract Account As it sounds, a **written-contract account** is one in which the practitioner and patient sign an agreement regarding the treatment and the payment agreement. For this type of an account, the payment agreement often states that the patient will pay the bill in more than four installments. Some states allow longer time limits for these accounts than for open-book accounts. Written-contract accounts are regulated by the Truth in Lending Act, discussed later in this chapter.

Single-Entry Account An account consisting of only one charge is referred to as a **single-entry account**. For example, someone vacationing in your area might come in for treatment of a cold. This person's account would list only one office visit. If the vacationer did not become a regular patient, the account would be considered a single-entry account. Some states impose shorter time limits on single-entry accounts than on open-book accounts.

Using Collection Techniques

Individual practices have their own ways of approaching the task of account collections. Most begin the process with statements, then telephone calls, and finally letters.

Initial Telephone Calls When calling a patient (or sending a letter) about collections, be friendly and sympathetic. Call the patient at home unless you have specific permission to call her at work. The first phone call to the patient should occur if payment has not been received after 30–45 days. Because the patient received a receipt or superbill at the time of the visit, any statement mailed after that is essentially the second notice of payment due. The first mailed statement usually contains a message that is friendly in tone, such as “Your prompt payment is appreciated.” When you call, assume that the patient forgot to pay or was temporarily unable to pay. You should ask the patient for the full amount due but have a minimum amount you would accept in mind (for instance, half). If the patient states that she cannot afford full payment, ask her what amount she feels she can send; if that amount is acceptable, obtain a date you can expect to receive the payment. If you do not receive the payment within 24 hours of the stated date, a phone call may be made and another statement sent. The message on this statement will be more urgent in tone because the patient did not respond to your phone call, and the tone of any subsequent communication will be still more urgent.

Follow-up Statements and Collection Letters

Once an account is 60 days past due, it is advisable to send an initial letter of inquiry. Usually this letter still has a friendly, “we want to help” tone, giving the patient options to take care of his obligation, but makes it clear that the patient must take some sort of action. Figure 20-9 shows an example of such a letter.

If an account is 90 days past due, your collection letter can contain stronger wording. For example, it might say “Please let us know when you plan to pay the \$250 past-due balance. We have sent you three monthly reminders. If you cannot pay in full now, please contact us at (number) to make payment arrangements. We want to be understanding but need your cooperation.”

If an account is 120 days or more past due, you can send a final letter. It might state “Every courtesy has been extended to you in arranging for payment of your long overdue account. Unless we hear from you by (date), the account will be given to (name of collection agency) for collection.” Be sure to note the cutoff date on the patient's ledger card. By law, you cannot threaten to send an account to a collection agency unless it will actually be sent on that cutoff date. Therefore, you must be sure you are ready to do so before you send such a letter. This collection letter should be mailed by certified mail with return receipt so that you have proof that the letter was sent and that the intended recipient received the letter.

If the patient does not respond with payment prior to the date stated in the letter, the practice will have no choice but to turn the account over to the office collection agency. We will discuss collection agencies later in the chapter.

Mr. J. J. Andrews
1414 First Avenue
Funton, XY 12345-6789

Dear Mr. Andrews:

It has been brought to my attention that your account in the amount of \$240.00 is past due.

Normally at this time the account would be placed with a collection agency. However, we would prefer to hear from you regarding your preference in this matter.

- () Payment in full is enclosed.
- () Payment will be made in _____ days.
- () I would like to make regular weekly/monthly payments of \$ _____ until this account is paid in full. My first payment is enclosed.
- () I would prefer that you assign this account to a collection agency for enforcement of collection. (Failure to return this letter within 30 days will result in this action.)
- () I don't believe I owe this amount for the following reason(s):

Signed: _____

Please indicate your preference and return this letter within 30 days. Please do not hesitate to call if you have any questions regarding this matter.

Sincerely,

Malik Katahri, CMM

Malik Katahri, CMM
Office Manager

FIGURE 20-9 Most offices use a collection letter similar to this so that the patient can simply make a choice, sign the letter, and return it to the office.

Payments After the Patient Visit

If you receive payments sometime after the patient visit, either by mail or in person, record them on the patient ledger card and day sheet, as you normally would. Record charges for practitioner visits to hospitalized patients or other out-of-office visits in the same way. If required, you can use the pegboard system to record bank deposits and petty cash disbursements in the daily log, but you will need the appropriate disbursement journal and overlapping forms.

Returned Checks

If a patient's check does not clear due to nonsufficient funds (NSF), you must adjust the account accordingly. NSF payments

are first deducted from the office checking account. The patient's account is then updated with a negative payment (noted in parentheses in the payment column) for the amount of the check, adding that amount back to the patient balance. The patient may also be charged an office fee for the inconvenience of dealing with the NSF check. Any fees your office charges for NSF must be clearly stated and in plain view for patients to see. In addition, if the bank imposes a fee on the office, these bank fees also should be passed to the patient to recoup the loss for the practice and marked on the patient's ledger. Depending on office policy, the patient may now be seen on a *cash-only* basis by the practice. Procedure 20-3, at the end of this chapter, explains the procedure for posting an NSF payment.

Refunding an Overpayment (Credit Balance)

Periodically, the combination of insurance payments and patient payments exceeds the allowed charges. This is called an overpayment. Sometimes this happens when patients feel they have not met their annual deductible, they pay their balance, and then the insurance carrier also makes a payment on the patient's behalf. After posting the payments, the account balance will be a negative number, which is called a *credit balance*. When this happens, the medical office owes the patient money. In some medical offices, if this amount is small, they leave it in place so that the next scheduled visit's new charges will be applied against this amount. Procedure 20-4, at the end of this chapter, outlines the procedure for processing a credit balance.

Many times, instead of leaving a credit balance on the books, the office will need to refund the overpayment amount to the patient. This refunded amount is noted in the patient's account, bringing the balance to zero. When this happens, you will create a letter explaining how the overpayment occurred and enclose the check for the refund amount. Procedure 20-5, at the end of this chapter, outlines the steps for processing refunds to patients.

Uncollectable Accounts

In every office, despite the best collection efforts by the staff and even an outside collection agency, there will be patients who simply will not, or cannot, pay their medical bills. These

accounts are known as *uncollectable*. In most offices the medical assistant and office manager or practitioner will meet monthly to discuss these accounts. When it is agreed that the money owed is never going to be collected, the practice manager or practitioner will give approval to adjust the remaining balance off the account. This practice *relieves* the A/R of these funds that will never be brought into the practice. An adjustment is made on the account for the full balance due, bringing the current balance to zero. Be sure to note the account with the name of the person giving approval for this adjustment. If it is office policy, also send the patient a registered letter informing him that he has 30 days to find a new provider because of the nonpayment of his account.

End of the Day

At the end of each day, total and check the calculations in all columns. If you find an error, correct it immediately by drawing a line through it and making a new entry on the next available writing line. Remember to make the correction on the patient ledger card and to issue a new receipt to the patient. To balance a pegboard system or patient ledger card, after adding the figures in each column, use the following formula for the column totals:

$$\begin{aligned} &\text{Previous balance} + \text{Today's charges} - (\text{Payments} + \text{Adjustments}) \\ &= \text{New accounts receivable total} \end{aligned}$$

Preparing an Age Analysis

Age analysis is the process of classifying and reviewing past-due accounts by age from the first date of billing. A monthly age analysis, such as that shown in Figure 20-10, helps you keep on top of past-due accounts and determine which ones need follow-up. Computer billing programs will prepare an age analysis for you, but you can prepare one by hand if your office

Accounts Receivable—Age Analysis								Date: October 1, 20XX
Patient	Balance	Date of Charges	Most Recent Payment	30 Days	60 Days	90 Days	120 Days	Remarks
Black, K.	120.00	5/24	5/24			75.00	45.00	3rd Notice
Brown, R.	65.00	8/30	8/30	65.00				
Green, C.	340.00	8/25						Medicare Filed

FIGURE 20-10 An age analysis organizes accounts by how long each has been on the A/R.

is not computerized. Offices that use ledger cards to track patient accounts often have a procedure to track how long since the last payment has been received. For instance, color-coded tags may be placed on the cards—yellow denoting 30 days past due; green, 60 days past due; red, 90 days past due; and black, 120 days past due. By pulling the ledger cards by color grouping, an age analysis can be completed easily either on graph paper or a spreadsheet. Include the patient's name, balance due, date of charges, and date of most recent payment, as well as how long each part of the balance has been "waiting" on the A/R. It also may be helpful to insert a column at the end for action the office has taken in attempting to collect this debt. Procedure 20-6, at the end of the chapter, outlines this process.

► Laws That Govern Credit and Collections

LO 20.6

Federal and state laws govern debt collection. Table 20-1 outlines the penalties for violating laws that regulate credit and debt.

Fair Debt Collection Practices Act of 1977

This act governs the methods that can be used to collect unpaid debts. Its goal is to eliminate abusive, deceptive, or unfair debt collection practices, such as threatening to take action that is illegal or that is not actually planned. It is this law that states that if you threaten to turn an account over to a collection agency if a payment is not made by the 15th of the month, you must actually do so.

Following are guidelines for sending letters and making calls requesting payment from patients. For further information, visit <http://www.ftc.gov/bcp/edu/pubs/consumer/credit/cre27.pdf>.

- Do not call the patient before 8 a.m. or after 9 p.m. Calling outside those hours can be considered harassment.
- Do not make threats or use profane language. For example, do not state that an account will be given to a collection agency in 7 days if it will not be.
- Do not discuss the patient's debt with anyone except the person responsible for payment. If the patient is

TABLE 20-1 Laws That Govern Credit and Collection Procedures

Law	Requirements	Penalties for Breaking the Law
Equal Credit Opportunity Act (ECOA) http://www.ftc.gov/bcp/edu/pubs/consumer/credit/cre15.shtml	• Creditors may not discriminate against applicants on the basis of sex, marital status, race, national origin, religion or age. • Creditors may not discriminate because an applicant receives public assistance income or has exercised rights under the Consumer Credit Protection Act.	• If an applicant sues the practice for violating the ECOA, the practice may have to pay damages (money paid as compensation), penalties, lawyers' fees, and court costs. • If an applicant joins a class action lawsuit against the practice, the practice may have to pay damages of up to \$500,000 or 1% of the practice's net worth, whichever is less. (A class action lawsuit is a lawsuit in which one or more people sue a company that wronged all of them the same way.) • If the Federal Trade Commission (FTC) receives many complaints from applicants stating that the practice violated the ECOA, the FTC may investigate and take action against the practice.
Fair Credit Reporting Act (FCRA) https://www.ftc.gov/enforcement/statutes/fair-credit-reporting-act	• This act requires credit bureaus to supply correct and complete information to businesses to use in evaluating a person's application for credit, insurance, or a job.	• If one applicant sues the practice in federal court for violating the FCRA, the practice may have to pay damages, punitive damages (money paid as punishment for intentionally breaking the law), court costs, and lawyers' fees. • If the FTC receives many complaints from applicants stating that the practice violated the FCRA, the FTC may investigate and take action against the practice.
Fair Debt Collection Practices Act (FDCPA) http://www.ftc.gov/bcp/edu/pubs/consumer/credit/cre27.pdf	• This act requires debt collectors to treat debtors fairly. It also prohibits certain collection tactics such as harassment, false statements, threats, and unfair practices.	• If one debtor sues the practice in a state or federal court for violation of the FDCPA, the practice may have to pay damages, court costs, and lawyers' fees. • If the debtor joins a class action suit against the practice, the practice may have to pay damages of up to \$500,000 or 1% of the practice's net worth, whichever is less. • If the FTC receives many complaints from debtors stating that the practice violated the FDCPA, the FTC may investigate and take action against the practice.
Truth in Lending Act (TLA) http://www.occ.treas.gov/handbook/til.pdf	• This act requires creditors to provide applicants with accurate and complete credit costs and terms, clearly and obviously.	• If one applicant sues the practice in a federal court for violation of the TLA, the practice may have to pay damages, court costs, and lawyers' fees. • If the FTC receives many complaints from applicants stating that the practice violated the TLA, the FTC may investigate and take action against the practice.

represented by a lawyer, discuss the problem only with the lawyer, unless the lawyer gives you permission to talk to the patient.

- Do not use any form of deception or violence to collect a debt. For example, do not pose as a government employee or other authority figure to try to force a debtor to pay.

Telephone Consumer Protection Act (TCPA) of 1991

This act protects telephone subscribers from unwanted telephone solicitations, commonly known as telemarketing. The act prohibits autodialed calls to emergency service providers, cellular and paging numbers, and patients' hospital rooms. It prohibits prerecorded calls to homes without prior permission of the resident and it prohibits unsolicited advertising via fax machine.

These regulations do not apply to people who have an established business relationship with the telemarketing firm or people who have previously given the telemarketing firm permission to call. The law also does not apply to telemarketing calls placed by tax-exempt nonprofit organizations, such as charities.

Although most provisions of this federal law do not apply to medical practices, you should be aware of the law. One way to avoid an unknowing violation of this law is to limit your calls to patients to the hours between 8 a.m. and 9 p.m. (some states, however, have exceptions for the TCPA provisions). Do not use an automated dialing device for calls to patients regarding their accounts; always place the calls yourself.

Observing Professional Guidelines for Finance Charges and Late Charges

According to the AMA, it is appropriate to assess finance charges or late charges on past-due accounts if the patient is notified in advance. Advance notice may be given by posting a sign at the reception desk, giving the patient a pamphlet describing the practice's billing practices, and/or including a note on the statement.

The practice must adhere to federal and state guidelines that govern these charges. The practice also should use compassion and discretion when assigning charges, especially in hardship cases. Because of the nature of medical care, many offices choose not to assess finance or late charges to patient accounts.

Using Outside Collection Agencies

If in-house collection efforts do not result in payment, the practice may wish to select a collection agency to manage the account. Because collection agencies keep a percentage of any funds they collect for their clients (usually between 40% and 60% of the collected amount), the office staff should use all reasonable methods to collect unpaid balances prior to sending an account to collection. Because of the humanitarian and ethical standards of the medical profession, practitioners must be careful to avoid collection agencies that use harsh or harassing collection techniques. Getting referrals for collection agencies from other medical offices will be helpful. The American Collectors Association International

(<http://www.acainternational.org>) may also be of assistance when choosing a collection agency.

Once an agency is chosen and accounts are deemed eligible for referral to the agency (after the appropriate notice has been given), the following information must be supplied to the agency regarding each account:

- Full name of patient and the last known address
- Occupation and business name and address
- Name of spouse, if any
- Total amount of the debt
- Date of the last activity (payment or charge) on the account
- Description of actions taken to collect the debt
- Response(s) received to collection attempts

Once an account has been turned over to the collection agency, all communication between the patient and the office concerning her debt must cease. All inquiries must be referred to the collection agency. If a payment is received after the account has been turned over, follow the procedure outlined in the agreement with the agency—some agencies allow the office to deposit the check and send the agency its percentage, and others ask you to return the check to the patient with the request that the patient call the agency.

When you receive a payment from the collection agency, it will list the total amount collected from the patient, the amount deducted for its fee, and the amount being forwarded to the office. When posting this payment, insert the amount received from the agency in the paid column. Use the adjustment column to insert the portion of the payment that was paid to the collection agency for its services. Subtract both amounts from the patient's balance to obtain the current balance. If the payment was considered payment in full, be sure to take the full balance on the account as an adjustment to bring the patient's balance to zero. Follow your office procedure regarding this account once the payment is made. Once a patient goes to collection, some offices also send a letter of discontinuation of services due to nonpayment, giving the patient 30 days to locate a new health-care provider. Procedure 20-7, at the end of the chapter, outlines the steps in turning an account over to a collection agency and posting a payment from the agency for a collection account.

Because the debt is now the responsibility of the collection agency, it is important to note all accounts that have been turned over to the agency. For computerized accounts, a comment may be made to the account or the patient's name and account number may be color-coded, denoting collection proceedings have begun. For practices that use ledger cards, the color-coded tabs used for aging may also be used to denote collection proceedings (often black tabs are used for this purpose).

Finally, it should always be the decision of the practice (and not the collection agency) whether to pursue legal action regarding an account or to adjust the debt off the books. All collection agencies should make a monthly report to the office, documenting the activity on the accounts they are working with. Give the collection agency a set amount of time to collect the debt, such as 60–90 days. After that time, the practice should decide how to best deal with the account if the debt has not been paid.

As stated earlier, when an account is deemed “uncollectable” by the practitioner or the office manager, the balance may be written off to “relieve” the A/R of money that will not be received.

Insuring Accounts Receivable

To protect the practice from lost income because of nonpayment, the practice may buy accounts receivable insurance. Policies can pay when a large number of patients (or one large account or insurance plan) do not pay and the practice must absorb the lost income. Some policies also protect the practice in the event that its A/R records are destroyed and the individual records may no longer be available. It will not pay to re-create the records, but it will allow for recoupment of at least some of the outstanding A/R. Accounts receivable insurance can protect the practice cash flow and help ensure that the practice will have sufficient income to cover expected expenses.

► Credit Arrangements

LO 20.7

Sometimes a practitioner or practice agrees to extend credit to a patient who is unable to pay immediately. This situation is common when a patient’s medical bills are high. By extending **credit**, the provider gives the patient time to pay for services, which are provided on trust. If the provider knows the patient well, she may offer credit without checking the patient’s credit history. However, to avoid charges of discrimination under the Equal Credit Opportunity Act (ECOA), you will normally perform a credit check prior to extending credit.

Following Laws Governing Extension of Credit

When you help the physician decide whether to grant credit to a patient, you must comply with certain laws governing extension of credit.

Equal Credit Opportunity Act The Equal Credit Opportunity Act states that credit arrangements may not be denied based on a patient’s sex, race, religion, national origin, marital status, or age. Credit also cannot be denied because the patient receives public assistance or has exercised rights under the Consumer Credit Protection Act, such as disputing a credit card bill or a credit bureau report. (Credit bureau reports are discussed in further detail a bit later.)

Under ECOA, the patient has a right to know the specific reason that credit was denied. Some reasons might include having too little income or not being employed for a certain period of time. Vague reasons about not meeting minimum standards or not receiving enough points on a credit-scoring system are not acceptable. In order to comply with ECOA, a credit check is required on any patient the practice is considering for extension of credit.

Performing a Credit Check To perform a credit check, be sure you have the patient’s most current information, including the patient’s address, telephone number, and Social

Security number, as well as the name, address, and telephone number of the patient’s employer. With this information you can verify employment and generate a credit bureau report.

Employment Verification Explain to the patient that you will be calling his employer to verify employment. Many employers have a designated person to handle such calls. The patient may be able to give you that name before you call the place of employment. After calling, record the updated information on the patient’s registration card, along with any credit references obtained from the patient.

Credit Bureau Report A **credit bureau** is a company that provides information about the creditworthiness of someone seeking credit. If a patient’s credit history is in question, you may request a report from a credit bureau, a sample of which is shown in Figure 20-11. A credit bureau collects information about an individual’s payment history on credit cards, student loans, and similar accounts. The three leading national credit bureaus are TRW Inc., Equifax Inc., and Trans Union Credit Information Company. If the practice decides not to extend credit based on the credit report, the Fair Credit Reporting Act states that you must inform the patient in writing that credit was denied based on the credit report. You also must provide the name and address of the credit bureau, but you are not required to discuss the information obtained from the report. The patient may contest the credit report and have any inaccurate information corrected. Once the information has been corrected, the provider may then decide to extend credit to the patient.

Extending Credit If the practice decides to extend credit, two common arrangements are made: the unilateral agreement and the mutual (bilateral) agreement.

Unilateral Agreement If the patient offers to pay the debt over a period of months, and the provider agrees, the patient will be billed every month for the full amount owed and should make whatever payment is possible each month. This type of arrangement is considered a unilateral agreement and is not regulated by the Truth in Lending Act.

Mutual Agreement The second option is the mutual, or bilateral, agreement between practitioner (practice) and patient. They might agree that the patient will be billed for the full amount owed each month and will pay a minimum amount each month. If the practice does not assess finance charges, and if the total number of payments is four or fewer, this type of agreement is also not covered by the Truth in Lending Act. If the practice and patient make a bilateral agreement that includes more than four payments, or if the practice assesses finance charges, the agreement is subject to the requirements of the Truth in Lending Act.

Truth in Lending Act

The Truth in Lending Act comes under Regulation Z of the Consumer Credit Protection Act. This act covers credit agreements that involve more than four payments. It requires

the practice and patient to discuss, sign, and retain copies of a **disclosure statement** (frequently called a federal **Truth in Lending Statement**), which is a written description of the agreed terms of payment (Figure 20-12). According to the Truth in Lending Act, a disclosure statement must meet the following two requirements:

1. The agreement must be discussed with the patient when the terms are first determined. The practice and the patient must agree on the payment terms.
2. Both the practitioner (or his representative) and the patient must sign the document to indicate mutual agreement on the written terms.

Further, a disclosure statement must include the following six pieces of information:

1. The amount of total debt (the amount for which the patient is receiving credit)
2. The amount of the down payment

3. The amount of each payment (which may be weekly or monthly or for another period) and the date it is due (frequently the total number of payments to be made after the down payment is also included)
4. The due date for the final payment and the amount of the final payment if different from the other payment amounts
5. The interest rate, if interest is to be paid, expressed as an annual percentage
6. The total finance charges, if any (if interest is charged, the total amount of interest accrued during the course of the debt will be entered here)

The practice and the patient should each keep a copy of the signed disclosure agreement. Procedure 20-8, at the end of the chapter, outlines the steps in creating and completing a Truth in Lending Statement (Agreement). Under the Truth in Lending Act, the patient is billed only for the monthly amount agreed upon, not the total amount of the debt. To avoid mailing a monthly statement, some offices create

a master document, given to the patient at the time of the agreement signing, that outlines each month's due date and the amount due, with a running total of the new balance once the payment is made. Figure 20-13 is an example of such a document.

Common Collection Problems LO 20.8

Collection problems come in many forms, but there are two common collection problems encountered by medical practices. The first is patients who cannot pay—also called hardship cases—and the second is patients who have moved

without leaving a forwarding address and therefore have not received a statement.

Hardship Cases

A practitioner may decide to treat some patients without charge—or at a deep discount—simply because they cannot pay. These patients may be poor, uninsured, underinsured, or elderly and on a limited income. They may be patients who have suffered a severe financial loss or family tragedy. Medical ethics require practitioners to provide care to individuals who need it, regardless of their ability to pay. Nevertheless, free treatment for hardship cases is at the practitioner's discretion.

FIGURE 20-13 Patient letter outlining the Truth in Lending Statement, including the payment dates and the amount of each payment.

Providing free care must be undertaken very carefully because, under the ECOA, if a patient is given free or reduced-fee treatment based on her inability to pay and another patient under similar circumstances is treated, she also must be extended the same financial consideration or a charge of discrimination may be levied against the provider. Some providers treat such patients for urgent problems and then refer the patients to federally funded clinics that are allowed to provide free or reduced-fee services related to their government funding.

Patient Relocation and Address Change

Sometimes a patient account remains unpaid because the patient has moved without leaving a forwarding address and has not received the statement. These patients are known as **skips**. Obviously, reaching such a patient about payment issues will provide a challenge.

Remember, you cannot discuss a debt with anyone except the person responsible for the charges. When you make a telephone call for collection, however, you may ask a third party for the patient's new address or phone number if known.

If the third party states the new address is not known, do not call again unless there is reason to believe that the third party has learned of the person's address or phone number since the first inquiry. If the patient had given permission to e-mail him, you may also try that avenue. Ask the post office for a forwarding address. If these avenues do not locate the patient, he may be labeled a skip and then referred to the office collection agency. Be sure to keep the returned statement and envelope stamped by the post office as "addressee unknown" or "no forwarding address" to prove a reasonable attempt to collect the debt.

► Banking and Negotiable Instruments

LO 20.9

In addition to the financial practices outlined earlier in the chapter, your administrative responsibilities also may include handling the practice's banking. Because a practice may use traditional (manual) or electronic (computerized) banking methods, you should be familiar with both. Regardless of which method you use, remember to keep all banking materials secure because they represent the finances of the practice. For example, to prevent theft of checks, always put the checkbook in a securely locked place when it is not in use. Also, file deposit receipts promptly. If they are lost, you have no proof that a deposit was made. Lack of proof could

cost the practice thousands of dollars. Because you will be responsible for office funds, it is important that protocols be in place and consistently followed. Be sure you are clear regarding the procedure to be followed and to whom within the practice you should report suspected lost or stolen funds.

Banking Tasks

Common banking tasks in the medical office practice include the following:

- Writing checks
- Accepting checks
- Endorsing checks
- Making deposits
- Reconciling bank statements
 - Recordkeeping of bank accounts
 - Balancing of individual accounts

Because many manual banking procedures revolve around the writing and receipt of checks, you must first have a thorough understanding of the terminology surrounding this common "piece of paper."

Checks

A **check** is a bank draft or order for payment (Figure 20-14). The person who writes the check is called the **payer**. By writing a check, the payer directs the bank to pay a sum of money

FIGURE 20-14 Parts of a check, with an example of a restrictive endorsement.

on demand to the payee. In order to be considered **negotiable** (legally transferable from one person to another), a check must

- Be written and signed by the payer or maker.
- Include the amount of money to be paid, considered a promise to pay a specified sum.
- Be made payable to the payee (the person named on the check) or bearer.
- Be made payable on demand or on a specific date.
- Include the name of the bank that is directed to make payment.

Types of Checks and Other Negotiable Papers In addition to personal checks from patients and business checks from insurance companies and other offices, you may also receive or even use the following types of checks in the medical office.

- **Cashier's check**—a check issued from the bank's account and signed by a bank representative. It is usually purchased by individuals who do not have checking accounts or for use in purchases where large sums are required, such as a down payment for a car or house, when the payee wants a guarantee that the check will not be returned for insufficient funds.
- **Certified check**—a personal or business check that is written and signed by the payer, taken to the bank the check will be drawn on, and stamped "CERTIFIED" by the bank. This stamp means the bank has already drawn the money from the payer's account and set it aside to guarantee that the check will be paid when submitted. Many banks no longer use certified checks, having replaced them with cashier's checks.
- **Voucher check**—a business (or personal) check with a perforated stub attached for recordkeeping. Instead of using a checkbook register, before the check is written out, the stub is completed with all of the payee information for the user's records. Voucher checks come in various styles and often in a three-ring binder format.
- **Limited check**—a check that is valid for redemption during a specific time frame, often only 30–90 days and usually used for payroll. Some accounts limit the amount of checks written as well as the valid time frames.
- **Counter check**—a bank-issued check that allows the depositor to withdraw funds from his account only. It states "PAY TO THE ORDER OF MYSELF ONLY." This may be used when the provider wants to draw off of the account in the absence of his or her checkbook; a counter check is similar to a withdrawal slip.
- **Traveler's check**—a check preprinted in established denominations of \$10, \$20, \$50, and \$100. These checks must be signed at the location where they were purchased. When using a traveler's check, it must be signed in the presence of the payee, and the signatures must match in order for the traveler's check to be valid for redemption.
- **Money order**—another kind of guaranteed payment. Money orders are purchased in banks or from other vendors for a small fee, using cash. They are often used by

people without checking accounts who wish to have a receipt of payment for their records.

Check Codes The face (front) of every check contains two important items: the American Banking Association (ABA) number and the magnetic ink character recognition (MICR) code (Figure 20-14). The **ABA number** appears as a fraction, such as 60-117/310, on the upper edge of all printed checks. It identifies the geographic area and specific bank on which the check is drawn.

Found at the bottom of a check, the MICR code consists of numbers and characters printed in magnetic ink, which can be read by MICR equipment at the bank. This code, which includes the bank's routing number, the customer's account number, the check number, and an area for bank use, enables checks to be read, sorted, and recorded by computer.

Parts of a Check The checks you encounter both personally and in your office contain many important features that should be inspected upon receipt to ensure prompt payment. Refer back to Figure 20-14 to familiarize yourself with the location of each item.

- *Payer*—account holder's legal name, usually preprinted with address and possibly other information like phone numbers and e-mail addresses
- *Date line*—date that is written in by the payer, stating that the funds are available as of this date
- *Check number*—indicates the number in a series
- *ABA number*—preprinted numbers appearing as a fraction, such as 55-12/345, identifying the geographic area and specific bank on which the check is drawn
- *Payee*—the name written on the "pay to the order of" line to whom the payer wishes the funds to be paid
- *Amount box*—box in which the check's numeric amount should be entered
- *Amount line*—line where the check's dollar amount is written out in words and the cents are usually put into a fraction over 100, followed by a line, to reduce the ability for someone to write in information. If there is a discrepancy between the amount box and the amount line, the amount line is the amount used when paying out the funds.
- *Bank information*—information that identifies the processing facility or the city and state of the account holder's branch bank that the funds are coming from; it may list the logo, address, e-mail, or any other special branch information
- *Memo line*—line that can be left blank but should be filled in to ensure that the payment is credited to the correct account. This can be done by entering any account information, which is extremely helpful when the payer is someone other than the patient, such as the spouse or parent.
- *Payer signature line*—line where the payer **MUST** sign the check in order for the funds to be legally drawn
- *Routing number*—9-digit portion of the MICR code that routes the check back to the issuing bank and should match the bank name and ABA fraction code number

- *Account number*—part of the MICR code that indicates the payer’s account within the bank
- *Check number*—part of the MICR code that identifies and refers back to the check number at the top right of the check
- *MICR recording area*—space for bank use only to record the branch and amount of the check

Accepting Checks Before accepting any check, review it carefully. First, be sure the check has the correct date, amount, and signature and that no corrections have been made. Refer to Figure 20-14, which shows a correctly written and endorsed check. Do not accept a **third-party check** (one made out to the patient rather than to the practice) unless it is from a health insurance company. Also, do not accept a check marked “Payment in Full” unless it actually does pay the complete outstanding balance. You may accept a check signed by someone other than the payer if the person who signed the check has power of attorney. **Power of attorney** gives a person the legal right to handle financial matters for another person who is unable to do so. Frequently, power of attorney is granted to a patient’s spouse, son, or daughter.

Be sure to follow your practice’s policy when accepting a check. For example, if a patient is new or unfamiliar, office policy may require you to request patient identification and to compare the signature on the identification with the signature on the check. Many offices will not accept post-dated checks because they are then responsible for holding the check until the date the bank will accept the check. Policy also may require that you not accept a check for more than the amount due because cash will be due back to the patient and then if the check is returned for insufficient funds, the office will be out not only the amount of the check but also the amount of the cash given to the patient.

Checking Account Types

It is not uncommon for a practitioner to have at least three different types of checking accounts: a personal account, a business account for office expenses, and an interest-earning account. The interest-earning account will be used for paying special expenses, like property taxes and insurance premiums. As a medical assistant, most of your banking tasks will involve the business checking account. You may sometimes, however, make payments from, or transfer money to and from, the interest-earning account, as directed.

► Preparing a Bank Deposit

LO 20.10

Endorsing Checks

Once a check has been presented for payment and received by the office, it should be inspected and then immediately endorsed, or accepted for payment. There are four principal types of **endorsement**:

- **Blank endorsement.** A blank endorsement consists simply of the payee’s signature. Once this endorsement is made, anyone who has possession of the check may cash it, so it

should only be signed when the check is being cashed or deposited immediately, not prior to arriving at the bank.

- **Restrictive endorsement.** A restrictive endorsement specifies how the check may be redeemed. In the case of the medical office, the endorsement is often made by a stamp and “restricts” redemption of the check to depositing it in the office checking account. Refer back to Figure 20-14 for an example of this type of endorsement.
- **Special endorsement.** A special endorsement may also be called a third-party endorsement, as the payee of the check signs it over to another person. For example, if an insurance check is sent to Nancy Evans, our case study patient, instead of the office, she could sign it over to the office like this:

*Pay to the order of BWW Medical Associates, PC
Nancy Evans*

By endorsing the check in this manner, Nancy ensures that only BWW Medical Associates can redeem this check.

- **Qualified endorsement.** Attorneys, who may accept a check on behalf of their client but have no personal claim on the transaction, most often use qualified endorsements. In this case, the attorney might endorse the check “without recourse,” which disclaims any future liability regarding this transaction.

If, after reading about the types of endorsements, you think the best type of endorsement is a restrictive endorsement, you would be correct. A restrictive endorsement prevents the check from being cashed if it is lost or stolen because the only way the check can be redeemed is by deposit into the specified account; if you do not use a restrictive endorsement for your personal checking account, do you think you might consider doing so now?

No matter what type of endorsement is chosen, always be sure to make all endorsements in ink, using a pen or rubber stamp. Place the endorsement in the 1.5-inch area indicated on the back of the check. Most personal and business checks have a number of lines or a shaded area preprinted on the checks for this purpose. (Refer to Figure 20-14.) Leave the rest of the back of the check blank for the bank’s use.

Completing the Deposit Slip

After endorsing the check, post the payment to the patient ledger card and to the daily log or day sheet. Then put the check with others to be deposited. Even if your office does not make daily deposits, it is a good idea to have a deposit slip started at the beginning of the day, adding each check to the deposit slip by hand or electronically as you receive it, as shown in Figure 20-15. In this way, you will have a running list of checks (and cash) to be deposited and can compare this to the day sheet at any time to verify the amount of the payments received by the office. The account number is printed on deposit slips in MICR numbers that match those on the checks. As mentioned, these numbers enable checks and deposit slips to be read, sorted, and recorded by computer.

Banks will accept a list of deposited items on something other than the bank-provided deposit slip if the bank’s deposit slip is attached. For example, if you are depositing 50 checks,

you may create a computer printout listing the payers' names, check numbers, amount of each check, and total. You can then attach the printout to a deposit slip with the total written on the deposit slip. Another method is to attach a calculator or adding machine tape listing the individual check amounts and including the total amount.

Making the Deposit

Plan to deposit checks and cash into the practice's bank account in person at the bank, as described in Procedure 20-9 at the end of this chapter. Make sure you are aware of your surroundings when making deposits because of safety issues. Always obtain a deposit receipt from the bank.

Again, depending on practice size, the frequency of deposits may be limited to several days a week; however, it should be done as often as possible to reduce theft, loss, bounced checks, and inaccurate recordings.

Electronic Deposits

With the advent of electronic claims submission, many payers and offices prefer to receive their insurance payments electronically as well. Electronic funds transfers, or EFTs, may be set up between the office and many insurance carriers, greatly decreasing the amount of time it takes to receive payment from the insurance carriers via US mail. Even smaller offices

that still submit paper claims to insurance carriers may be able to receive their insurance payments electronically. The office will receive notification from the insurance carrier of any payment (deposit) sent to the office checking account along with the explanation of benefit (EOB), also known as the remittance advice (RA), explaining which patient accounts the payment pertains to. You can learn more about remittance advices, both electronic and paper, in the *Insurance and Billing* chapter.

▶ Reconciling the Bank Statement LO 20.11

Another important administrative task that often is part of the medical assistant's role is the banking task of reconciling the bank statement. **Reconciliation** involves comparing the office financial records, the checkbook or disbursements journal, with the bank records (statement) to ensure that they are consistent with each other and accurate. In most practices, this task is performed once a month when the practice receives the monthly checking account statement from the bank, either in the mail or electronically if the office utilizes the bank's electronic banking services. Figure 20-16 shows an example of a typical bank statement.

When reconciling the checkbook with the bank statement, keep in mind one thought: "the bank needs to 'know' everything I know regarding what I have paid and deposited and I,

FIGURE 20-16 A typical bank statement used to reconcile the office checking account.

in comparing the bank statement to the checking account, need to be sure that I have recorded everything that the bank knows.” Let’s look at a simple scenario:

When the bank statement comes in, you immediately block out some quiet time to take care of the reconciliation. In comparing the deposits and payments recorded by the bank as completed, you note a \$2,000 deposit made 2 days ago, which is not yet recorded, and three checks you sent out totaling \$800, which also have not yet been redeemed. These items are not yet “known” by the bank. You also notice that the automatic payment of \$500 for quarterly payroll taxes has not been recorded in the checkbook. The bank statement shows a balance of \$10,900. The office checkbook shows a balance of \$12,600.

Bank Statement		Checkbook	
Balance	10,900.00		12,600.00
(deposit)	+ 2,000.00	(autopay)	−500.00
	12,900.00		12,100.00√
(outstanding checks)	− 800.00		
	12,100.00√		

Once the deposit that has not cleared is added to the bank statement balance and the outstanding checks are subtracted, the new balance is \$12,100. At the same time, when the auto-payment is subtracted from the checkbook balance, its balance is also \$12,100. You have successfully reconciled the

[illegible]

bank statement. Figure 20-17 shows you an example of a reconciliation worksheet. The complete reconciliation process is explained in Procedure 20-10 at the end of the chapter.

for recording and depositing checks, just as if you were using traditional methods, but you will see these differences:

Many medical office software programs are available today and each one has a different interface, uses different menus, and prompts you for information in different ways. However,

certain general concepts apply to all. All software will allow you to record deposits, pay bills, display the checkbook (and account balances), and reconcile the bank statement. For specific information, consult the user's manual that comes with the program used by your practice. Before electing to sign up for electronic banking, check with the current bank used by the office to see what safeguards and protections it offers regarding the information the office is transferring electronically. Electronic banking can speed up processes for the office, but it is extremely important that the office remain in control of how that information is protected and who has access to the information. If the bank currently used by the office does not use appropriate safeguards for electronic banking procedures, the office may want to consider changing financial institutions.

Record Deposits

If you select "Record Deposits," a message on the computer screen prompts you to enter information about each check to be deposited that day. This information usually includes the check writer's name and the amount of the check. The check's ABA number also may be requested. After you enter this information, the computer gives you a chance to double-check it. If all the information is correct, you continue entering and checking the other checks, one at a time. You can then select a command to print a deposit slip that contains the information you have just entered. To make the deposit, place the cash and checks in a deposit bag along with the computerized deposit slip and the bank's deposit slip.

Pay Bills

The bill pay function allows you to log checks that you write into a computerized checkbook register. For each check you want to write, a message should prompt you for information, such as the payee and the amount of the check. The computer also should give you a chance to verify and correct this information before moving on to the next check or printing the checks. More and more programs, depending upon the bank the office uses, also allow for electronic bill pay. Recording these payments in the electronic (or paper) checkbook register is the same as when writing a check, except instead of recording the check number, you will record the transaction number assigned by the bank as proof the payment has been sent.

Some software programs automatically assign the next available check number to each new check you enter. To double-check that the computer-assigned check numbers match those on the actual checks, print a list of the checks you have entered and compare it with the checks before mailing them.

Display the Checkbook

The checkbook display function allows you to review the electronic checkbook register. Although you cannot change information that appears in the register—unless your software and your bank allow total electronic banking—you can print it out so you can be sure the checks have been recorded properly and you can check your latest balance.

If you select "Display Checkbook" from the "Banking" menu, the computer displays a list of all checks that have been entered into the register. Information includes check number, date, payee, and amount. Scrolling up and down reveals all the checks in the register. This area also will reveal any auto withdrawals or auto deposits that have been made up until the current date (one of the advantages of electronic banking), and the balance and current statement may be checked at any time, not just once a month when the bank statement arrives.

Balance Checkbook

The "Balance Checkbook" option electronically reconciles the monthly bank statement. After you enter the appropriate date or dates, the computer screen displays all the checks and deposits that were logged into the register in the order they were posted.

The next screen highlights each check or deposit that has not been seen on a previous bank statement. You are prompted to indicate whether that item appears on the current statement, usually using Y for yes and N for no. After the computer queries these items, it may ask you to enter any items that appear on the current bank statement but are not in the checkbook, such as service charges.

Finally, a message on the screen prompts you to enter the current account balance from the bank statement. Then, the computer reconciles the bank statement. It will alert you if the system balance does not agree with the balance on the bank statement. If the balance does not agree, recheck the information you entered for possible errors. If you have rechecked your work and a coworker has also acted as a "second set of eyes" and has verified no errors or omissions, yet the balances still do not agree, call the bank to determine if a bank error has been made.

► Accounts Payable and Managing Disbursements

LO 20.13

Accounts payable (A/P) are the practice expenses, and accounts receivable reflect the practice income. This section focuses on accounts payable and the process of making those payments, known as disbursements. A basic accounting principle to bear in mind is that when a practice's income exceeds its expenses, it has a profit, commonly called "being in the black." If a practice's expenses exceed its income, it has a loss, known as "being in the red."

Because of this relationship between income and expenses, most practices try to reduce expenses by controlling accounts payable. As the office medical assistant, you play an important role in helping control accounts payable in order to maximize profits.

Accounts payable fall into three main groups:

- Payments for supplies, equipment, and practice-related products and services
- Payroll, which may be the largest of the accounts payable
- Taxes owed to federal, state, and local governments and agencies

A practice's accounting system usually consists of several elements. These elements include the daily log, patient ledger cards, the checkbook, the disbursements journal, the petty cash record, and the payroll register. In this chapter, you are focusing on the first four elements. You will explore the petty cash record and payroll register in the *Practice Management* chapter.

As discussed earlier in this chapter, the daily log and patient ledger cards are used primarily for accounts receivable. The disbursements journal (as well as the petty cash record and payroll register) is used primarily in accounts payable.

Disbursements

A disbursement is any payment the practice makes for goods or services. One of the most common disbursements is payment for office supplies. Other disbursements include payments for equipment, dues, rent, taxes, salary, and utilities. No matter what type of disbursement you make on behalf of the practice, you must keep accurate records of the purchase and the payment.

Recording Disbursements You may record disbursements in a check register, in a disbursements journal, or on the bottom section of the daily log. If you use a disbursements journal, follow these steps to record disbursements:

1. When beginning a new journal page, give each column a heading to reflect the type of expense, such as utilities or rent. Procedure 20-11, at the end of this chapter, outlines how to set up a disbursements journal.
2. For each check, fill in the date, payee's name, check number, and check amount in the appropriate columns.
3. Determine the expense category of the check.
4. Record the check amount in the column for that type of business expense.
5. If you must divide a check between two or more expense columns, record the total in the check amount column. Then record the amount that applies to each type of expense in the appropriate column. The total amount listed in the check amount column must equal the sum of the amounts listed in the expense columns.

Writing Checks

Virtually all disbursements are made by check, although electronic payments are becoming more and more common. Paying by check gives the practice complete, accurate records of all financial transactions. If your office uses electronic banking, including bill pay, the transaction number given by the bank, at the time the bill is paid, should be recorded in place of the check number in the disbursements journal and checkbook for future reference.

Before writing a check, make sure the checking account balance is up-to-date and large enough to cover the check you want to write. Enter the date, check number, payee information, and reason for the payment on the check stub and then subtract the amount of each check from the previous balance,

enter the new balance, and carry that balance forward to the next stub. Do this step before writing the check so that the payment entry is not accidentally omitted from the disbursements journal. The same information holds true when electronic banking is utilized. Be sure to record the payment in the disbursements journal or online checkbook prior to sending the payment.

If you use a pegboard system for your checkbook/disbursements journal, you will automatically record the date, check number, payee, and check amount on the check register as you write out the check because of the carbonless paper that is on the back of the check itself. You must note the reason for payment and the new balance manually, however. Record that information in the appropriate spaces on the register.

If you make an error when completing a check, write VOID in ink across the front of the check in large letters so that it cannot be used again. Then file the voided check in numeric order with the returned checks.

After filling out the check properly, detach it from the checkbook and give it to the doctor to sign, along with the invoice to be paid. Mark the date, check number, and amount paid on the invoice. Make a copy of the invoice for your records. Keep these copies with supporting documents, like order forms or packing slips, in a paid-invoice file. Then, mail the check and the original invoice to the payee in a neatly hand-addressed or typewritten envelope. If you use a window envelope, be sure the payee's address shows through the window.

Recording disbursements in columns for each type of expense allows you to total and track expenses by category. **Tracking** (watching for changes) is important because it helps control expenses. Before tracking, check your calculations by performing a trial balance:

1. Total the check amount column.
2. Calculate the total for each expense column.
3. Add together all the expense column totals. The combined expense column total should match the total in the check amount column.
4. If the amounts do not match, recheck every entry until you find the error. When you find it, draw a line through it and record the correct information neatly above it or to the side.
5. When the two amounts match (or balance), carry forward all column totals to the disbursements journal for the next month. Remember to prepare summaries and perform balances at the end of every month, quarter, and year.

If your office uses an office management software package, trial balances and financial summaries are created with a few keystrokes. Remember, however, computer programs are only as good as the information entered into the programs. If you make a keystroke error when entering information, the trial balance and/or financial summary will contain errors. Always enter financial information—whether you write it by hand or key it into a computer program—with great care.

Understanding Financial Summaries

The practitioner or practice manager may periodically analyze the practice's income and expenses. Financial summaries provide an easy-to-read report on the business transactions for a given period, such as a month, quarter, or a year.

In the past, it was necessary to have an accountant to prepare financial summaries. But with more offices utilizing practice management software, creating these reports using the software package or templates is a relatively simple process once the procedure is understood. A medical assistant with a basic understanding of the information contained within financial summaries will be an asset in helping the practice to remain financially stable. Following are some of the records found in most financial statements.

Statement of Income and Expense Also called a profit-and-loss statement, a statement of income and expense highlights the practice's profitability. It shows the physician the practice's total income and then lists and subtracts all expenses.

Cash Flow Statement A cash flow statement shows how much cash is available to cover expenses, to invest, or to take as profit. The cash flow statement begins with the cash on hand at the beginning of the period and shows the income and disbursements made during that period. It concludes with the new amount of cash on hand at the end of the period.

Trial Balance The practitioner or practice manager may review trial balances periodically to ensure that the books balance. As described earlier in this chapter, the combined expense column total should match the total in the check amount column. If the amounts do not match, recheck every entry until you find the error and the column amounts balance.

Although not considered by many to be as "glamorous" as patient care, the medical assistant who focuses and excels in the administrative procedures for the practice—particularly its financial practices—and takes an interest in controlling expenses while maintaining quality care for patients will be an outstanding asset to any practice in the "business of medicine."

PROCEDURE 20-1 Posting Charges, Payments, and Adjustments

WORK // DOC

Procedure Goal: To post charges, payments, and adjustments to the patient account

OSHA Guidelines: This procedure does not involve exposure to blood, body fluids, or tissue.

Materials: Daily log sheets, patient ledger cards, and check register or computerized bookkeeping system; summaries of charges, receipts, and disbursements

Method:

1. Create a ledger card (patient account) for each new patient and maintain a ledger card for each existing patient. Include the following information on each ledger card:
 - a. Patient name
 - b. Patient address
 - c. Patient home and work phone numbers
 - d. Insurance carrier with policy number and guarantor information
2. Update the ledger card every time the patient incurs a charge or makes a payment. Be sure to adjust the account balance after every transaction. In a computerized system, a patient record contains the same information as a ledger card. This record also must be maintained and updated.

RATIONALE: *The information on each patient's ledger card must match that of the daily log.*
3. Use a new log (day) sheet each day. For each patient seen that day:

- a. Record the following: patient name, the relevant charges, and any payments received.
- b. Calculate any necessary adjustments and new balances.
- c. When using a computerized system, enter the patient's name or account number, the relevant charges, along with any payments received and adjustments made in the appropriate areas. The computer program will calculate the new balances.

RATIONALE: *Each day's transactions must be accurately and promptly recorded.*

4. Record all deposits accurately in the check register.
5. File the deposit receipt—with a detailed listing of checks, cash, and money orders deposited—for later use in reconciling the bank statement.
6. The deposit amount should match the amount of money collected by the practice for that day.

RATIONALE: *If the receipts for the day and the deposit for the day match, you have balanced for the day.*
